"To the boat! there's a brave ship struck!" he cried, as he started to his feet with wonderful alacrity, and limped away towards the little harbour. But none followed him. The fishermen continued to gaze in awed silence on the stormy sea, which every moment appeared to grow more furious, and to shake the very shore with its mighty waves.

"Is there na Christian man amang ye that will run a risk to save a sailor's life?" exclaimed Partan, reproachfully.

"Here's I for one!" shouted Madden Ray, the fisherman who'd first summoned him, and whose children were crawling about, trying to steady their tottering little feet in the storm.

"Hoot awa, man!" screamed his wife; "the chiel's daft, an' sae are ye, to face the wrath of heaven in sic a night!" and a pair of stout arms were folded round the volunteer's neck, while two or three smaller pairs encircled his legs.

"Is there na ne'er-do-well amang ye?" shouted Partan again, "that will take chance wi' me to save yon puir perishing folk; and maybe women and bairns amang 'em in the waves?"

Swilltap, the publican's son, stepped forward at this appeal, but instantly knocked down by his indignant sire. Tinwald then raised his voice, and conjured all, for the love they bore him, for the honour of old Scotland, for the sake of heaven, not to leave strangers to perish on their own shore without one brave effort to save them. "We want but one," he continued, "but one who can hold a helm or pull an oar."

"It's na use—it's na use!" sternly exclaimed the oldest fisherman, "na boattie in Scotland could live in sic a say. It's God's will sent the creatures into yon extremity, God's will be done!"

"His will be our speed, then!" exclaimed Alice, who had only waited to muffle her delicate form in a plaidie, and had joined the group "'His will be done!' as Master Ray says, and let us do it Partan, 'the battle is not always to the strong;' you ken weel that I can hold a tiller; and if you and the young laird row, we may yet be in time to save."

"The villagers had remained impassive to the adjuration of mercy and of heaven, but one electric impulse seemed to stimulate them all as Alice spoke. The old fatalist was the first one to fling off his doublet, and thrust it into his wife's face; all down to young Swilltap followed his example, and moved towards the boat.

"Not sae, not sae, bonny laddie!" was the cry; "there be hands, though not hearts, here, better fitted for sic wark," They seized upon the largest of the fishing-boats, and were about to launch her from the blocks, when Partan interfered—

"Not her!" he shouted; "as Master Ray says, she wadna live; but the Bonito boattie will swim as long as twa planks hand thegither. Come, wi' a will, lads; heave all," and the gallant little craft was hurried from her rest into the water, that leaped and

foamed even in this sheltered cove. Tinwald jumped on board, and others would have crowded after him, but Partan stopped them, and chose only three of the youngest and stoutest.

After a little preparation, they were off, followed by a cheer that stuck in the throat of friends, parents, and lovers who tried to utter it. In a few minutes a bit of a spritsail was run up, and the Bonito, after some impatient curvets in the calmer water, bounded like a gallant courser into the raging sea. As she rose over the first few waves, her tiny sail was visible above the foam, but then became lost in the dark confusion of the elements

The minister of Sandilee had by this time reached the scene of action, and readily availed himself of the occasion to summon his little flock to prayer. Only snatches of his words were heard through the storm, but the full hearts around him could well supply the rest.

He was yet speaking when the first streak of dawn appeared The face of the preacher became distinct, then the shore, and at length the tossed sea opened to view. Every eye was turned towards the sandbank, and the hull espied by Partan's practised eyes was now visible to all The Bonito was nowhere to be seen.

But soon the shouts of her brave crew were heard. She had performed her daring task, and returned to the little cove just before daybreak. The result of her adventure had been a single man rescued from the wreck, and, as he was found with handcuffs on his wrist, the old superstition against the rescue of drowning men revived in full force. None of the fishermen, hospitable as they naturally were, showed themselves desirous of receiving so suspicious a guest, and so, with one accord, they bore off the exhausted and half-drowned man to Tam's house.

A TEMPEST.

Profound silence settled over the Bonne Esperance and all her desperate crew. The stern vigilance of Lawrence had given place to the license claimed at first by a new-made captain The watch, having drunk almost as deep as their comrades, were all asleep at their various posts. Even the helmsman nodded at the wheel, only started now and then into wakefulness, as the neglected ship came up to the wind, and her sails were shaken But the wind soon died away; the very heavens seemed to be asleep, and the stars to twinkle drowsily. A vast dark curtain of clouds rose slowly up the northern sky, and soon, but imperceptibly wrapped the ocean in a double night. Still the drunken freebooters slept on, it might have seemed a ship of death, with a black and universal pall spread over it. The white sails towered up into the darkness like gigantic ghosts, and ever and anon small tongues of lambent flame would hover, spirit-like, over the mast-head The sea began to heave and swell portentously, with a long and measured motion, that lulled the sleepers into a yet deeper slumber, and, all the while, a strong current bore the ship swiftly and helplessly along, as in a dream.

Suddenly the wild storm of the tropics awoke, and burst upon the world of waters with terrific uproar. Thunder shook the heavens with prolonged roar, and sheets of lightning wrapped the gleaming sea in one wide flame. The waves were roused instantly to fury; but, ever as they rose their crests, were whirled away by the tornado, and scattered into clouds of spray.

The best prepared ship could scarcely have endured that fierce and sudden storm; but the brigantine had every sail set to the previous gentle breeze, and every hand that should have helped her was relaxed in sleep. Instantly as the hurricane assailed her, she was struck down on her beam-ends; the sea rolled over her in all its force; the decks had been strewn with the drunken revellers, who were now helplessly drowned as they lay; even the watch were only awakened by the wave that carried them away into the raging waters. Almost instantly all was over, and but two living creatures interrupted the sublime loneliness of the stormy sea.

Alvarez, like the rest of the ship's crew, had been asleep, his dreams haunted by the loud brutal songs and impious jests of the pirates. Suddenly, in his dream, it seemed to him as if those shouts of revelry were changed to shrieks, and at the same moment he had become, he knew not how, involved in their orgies. He seemed to reel and stagger, and the bowl of wine that they had been sitting round seemed to gush up like a great fountain, and pour down upon him and all the revellers, washing them away in its red torrents. Startled by the sudden sense of drowning, he awoke to find himself on the angry sea, with wreck, and ruin, and destruction all around.

THE SHIP ON FIRE.

As the king's officer came forward in his turn, his speech was interrupted by a cry of "Fuego!" from the forecastle; a thick volume of smoke, at the same time gushing up from the hold, diffused a sulphurous stench. The ship had been set on fire by one of the quenchless fire-balls that the buccaneers were accustomed to make use of in extremity. It had fallen among bales of silk, which for some time smothered the fierceness of the flame; but it had the more extensively and subtly done its work, and the fire was proportionately destructive. The boats were immediately lowered, and those on board had barely time to put off when the galleon was on flames from stem to stern. Even the wounded buccaneer and the sick English sailor had been saved. The boats rowed fast towards Alvaro's ship, and almost immediately after they had reached her the galleon blew up, and no trace was left of the gallant ship but a few seething planks, and some bubbles on the calm water in which she had gone down.

A dreadful pause for a moment ensued. Then one of the Spaniards cast off his grappling irons and stood away, but carried with him a shower of unquenchable fireballs, which the Buccaneers had flung upon his decks and into his hold: every man on board only thought of extinguishing them, and the ship ran away before the wind. Then Lawrence, with his pistol still presented to his magazine, shouted to his men, and they leaped upon the deck of the other Spaniard, whose crew all unnerved by the still threatened explosion, scarcely offered any resistance. In a few minutes they were conquered, slain, flung overboard. The remaining Spaniard was now on fire forward, and her sails burned up rapidly into three pillars of flame. The despairing crew had retreated to the lofty poop, and were trying to lower their boats, but Lawrence ranged up alongside, and poured in a steady fire of musketry, under which they fell fast. The flames had now eaten their way aft, and were creeping up to the poop. The Buccaneer stood away to avoid the explosion which must soon take place, and the miserable Spanish crew threw themselves into the sea There for a few minutes they remained floundering about, but they were soon suddenly twitched under water, and then quickly ensanguined waves showed that the sharks were busily at work The friar's dark form was still to be seen on the ship, relieved of the flames, that towered up behind him all at once they ceased, as if concentrating all their efforts below, and then shot up into the sky, scattering far and wide every remnant of the ship

In fact, she was like those who have lost dear relatives at sea, and who love to soothe their sorrows by sitting on the shore and watching the waves as they come and go, in some dreamy expectation that somehow they may bring tidings of those who have gone down among their fellows. Such was the news that Isabel waited for by the ebb and flow of life's great stream in London."

LETTERS FROM CALCUTTA.—No. V.

A very general prejudice exists in England against servants who have many relatives so near at hand as to be likely to become frequent visitors, and it is not unusual when hiring a servant to state that "no followers are allowed"

This injunction would be extremely ridiculous in Calcutta where every domestic in your establishment is constantly visited by the different members of his caste, who are called *Bhaees* or brothers. During the early days of my novitiate, or as it is here styled griffin-hood, I was greatly puzzled to understand how it was that all my servants had so many brothers. Not a day passed but some one had a brother married or dead, sick, or giving a dinner. If I inquired the reason of an unusual assemblage in the "compound" the answer was always—"My brothers," and if one fell ill or wanted a holiday, he sent a brother to supply his place. At length I discovered that these followers were in very few instances relations, but merely members of the same union This system is destitute of the inconveniences it would produce at home, and has even many advantages The absence of a servant from any sudden cause may as suddenly be supplied, while the whole household may be assembled at an hour's notice; the sircar or head man who selects them being responsible for the honesty, which is the principal point, all of them being pretty equally skilled in the mysteries of their various callings.

Servants hired for the day are called *Tocas*, and but for them the mistress of an establishment would often be in great straits, for when a servant wants a holiday he will have it, however inconvenient it may be to his employers. Thus the cook will disappear on the day when a dinner party is to take place, and the ayahs invariably retire or feign illness when the mistress is taken ill. If a servant's application for leave is refused, he will feign sudden sickness with such admirable art, that though you are convinced of the falsehood, you find it impossible to detect him. He will groan and writhe as though in the last stage of cholera, and you are glad to send him out of the house lest he should expire on the spot. Another favourite excuse is the illness or death of relatives. A man will come, in the agony of grief, entreating permission to visit his parents up the country, and who have most probably been dead some years, or it will be to attend the burying of a wife or child, when he is really going to a caste dinner, where he will make himself really ill by intoxication, a vice too common among the Bengalees, and will plead his intense grief as a reason for his prolonged absence.

I have not found the Hindoos disposed to introduce their Bhaees at the expense of others, but of course they prefer being associated with their own set, as they can economise by eating together However, when a fair chance opens, they are not slow in availing themselves of it, and the favour of "your honor" is solicited by a written petition. These petitions are the productions of native writers whose knowledge of English composition being rather confused, these documents are sometimes extremely amusing. Here is a specimen:—

"To ——, Esq.

"The humble petition of Paluan,
Coachman of Mr ——

"Sheweth,

"That your petitioner begs to state your honor that your coachman will not soon recover, on which your carriage and harness will spoiled, therefore your petitioner inform your honor, hoping kindly take a substitude from your petitioner, he will supply you a good coachman, and as he had been employed under your protection, he will give you such man as like him. And your petitioner, as in duty bound, shall ever pray."

Here is another from my Dirzee or Tailor, sent in consequence of my having given some work to another party.

"To the Mem.

"The humble petition of Tuckeeboolla,
Tailor in your s

"Most humbly sheweth,

"That your petitioner take the liberty to communicate his cases before you. Your poor petitioner take your service in hopes of support with his family, in consequence humbly begs that your honour would be so much graciously pleased to grant him the works which you are wanted to give out another tailor, because he had shop in his own house, he can made gentleman's and lady's works well

"I am, Mem, your most obedient servant'

A tailor is as necessary a member of a Calcutta household as a Cook. During eight months of the year nothing that will no wash can comfortably be worn. The frequency of washing and the mode—which is to dash the articles on a rough stone till they are clean,—create weekly dilapidations, which require the constant labour of one person to repair. The Dirzees are all Mussulmans, and live in a large village on the river side, about six miles below the city, to the great inconvenience of their employers, but evidently to their own satisfaction. Nothing will induce them to reside nearer to the scene of their labours, and every morning at sunrise, these men may be seen trooping across the plain in long straggling files, while, every evening at sunset, they, in the same order, return to Dirzee-land. The wages of a Dirzee, if hired by the day, are four annas (about sixpence) but he is generally employed regularly at from seven to nine rupees per month, according to his skill The hours of labour are from 9 to 5, during which time he takes no food, but is allowed half-an-hour for smoking, and, if he is piously disposed, for his mid-day prayer and ablutions. They are neat and clean in their dress, quiet and almost stealthy in their movements. There, in the corner of the common sitting-room, or in the verandah of every house, they may be seen squatted on a mat amid heaps of silk and muslin, engaged in every kind of needle-work, from the humble darning of stockings up to the mysteries of a coat or a ball-dress. They have no stock in trade, and carry with them only a thimble, scissors, and measuring-tape, carefully wrapped in a small housewife; the necessity for pins and lead pincushions is obviated by the extraordinary use they make of their toes, and which would greatly astonish those who are accustomed to depend exclusively on the cunning of their hands. They are very clever imitators, but cannot design or make any alteration of which they have not an example. Their work is remarkable neat, but too firm for slight materials, and almost hopeless to unpick; they persist in stitching everything, and will put as firm a seam to fine muslin as to long-cloth. All this neatness and precision is obtained at the expense of speed; their slowness is sadly tormenting to any one accustomed to the activity of European needlewomen, nor is it of any avail to hurry them. They will tell you that they have done as much as usual, that mem so and so's Dirzee does no more; and they will receive a sharp scolding with an imperturbable face, which seems to have "nothing will hasten me" written in every feature

You will perceive that the position of the Hindoo tailor is very different from that of his English brother. He knows nothing of the sweating system, nothing of fluctuating wages, and nothing of nights as well as days of toil. Like all the other castes, his is nothing less than a trade-union, against which it is useless to struggle, for he will not work longer or for less money than he has agreed with his bhaees to do. Though the

he receives will appear to you extremely small, yet it is more than sufficient to pay the rent of his palm-leaf hut and to provide his daily meal of rice and curry. The father of the family is the head of each establishment, both he and those he employs being frequently rich—the possessors of houses and the givers of entertainments. But they know very little improvement in their craft, and nothing of advancement in their social position—as was the father, so is the son, and so will he be to all future generations, so long as caste exists and as ancient custom and the faith of the false prophet holds him in bondage.

Closely allied to the dirzee is the chikan wallah, or embroiderer of muslin. This man, who is also a Mahommedan, enters your apartment with a profound salaam, seats himself on the floor as near to you as proper respect will allow, and without speaking or being spoken to, opens his package and displays his stores to your admiring eyes These are the loveliest India

in dresses flounced and sprigged all over, either in white or colours. Babies' frocks and caps loaded with the finest embroidery, chemisettes, mantels, lappets, and pocket handkerchiefs of the beautiful pine-apple fibre, more delicate than French cambric, and covered with wreaths of hemstitching. All the treasures of "the West End," and of the embroiderers to the royal family, are imitated and out done.

If you are known to be a new comer he will ask a high price, but the true value in this land of cheap labour is soon learnt, and you may be sure that he will not depart without selling something Articles worth a guinea in Regent-street, may be had for one third and as none of these men can resist the sight of gold, you have only to show him a sovereign, and he will give you half his stock in exchange. The patterns are all drawn on the muslin with a red liquid, and specimens are marked in the same manner on strips of parchment They will copy anything you show them, and appear never to make a mistake, or deviate in any way from the pattern. Most of the work is done up the country where labour is cheaper than it is even in Calcutta. The men who hawk the goods are frequently wealthy, having purchased houses and land with their profits, some possessing whole villages inhabited by their workmen.

The very cost of living in this country for men whose daily expenses may be, and often are, confined to the purchase of rice and ghee, is so small, that apparently trifling profits accumulate rapidly When once a surplus capital is secured, it may be invested at enormous interest, and not unfrequently the humble looking being who is crouching at the feet of the purchaser of his wares, is possessed of an annual income which would enable him, if he chose, to assume the position which he seems to regard with so much respect and reverence.

EMIGRANTS' HOME AND GOVERNMENT STATION AT BIRKENHEAD.

UNTIL the present time, the free passengers sent out by Government to our Australian colonies have been collected in London and shipped from that port for their destination, which, as a large number, if not the majority of them, came from Ireland, necessarily entailed considerable inconvenience on the passengers, and much waste expenditure of the public funds. The attention of the Commissioners of Emigration having been called to that fact, they have resolved to establish a station in this neighbourhood, at Birkenhead, as a more convenient locality for persons proceeding from the sister island and from the north of England and Scotland, than the metropolis With the view of carrying out their intentions in this respect, they chartered the Mangerton, belonging to Messrs Barton and Brown, of Cook-street, annexing this condition, however, to the contract, that the commissioners should not be at any expense in providing such a depot as they required for the accommodation of the emigrants till the period of their embarkation.

This home has accordingly been fitted up, in one of the dock warehouses, at the south-eastern corner of the great float—the free use of which has been kindly granted by the Birkenhead Dock Warehousing Company—by Messrs John S De Wolf Co., through whose courtesy we have been able to inspect The lower floor contains a number of tables, forms, and other conveniences for a great hall, or general [illegible] has only a brick floor, and as the wood partitions about [illegible] rough and unpainted, the place has somewhat of a temporary, naked, and cheerless aspect. If the experiment—for as yet the thing is necessarily only an experiment—should succeed, it is intended to lay down a boarded floor, to increase the accommodations at present afforded, and to give it a greater appearance of comfort and stability. This applies, we understand, to every part of the "home," which, till the contemplated improvements are effected, will continue to look "raw" and uncomfortable

On the floor above are large dormitories— one, for married persons, containing 74 berths, with bedding and bedroom requisits complete, another, for single females, containing 50 berths, each intended, we believe, for the accommodation of two persons, and the third, for single men, about the same size as that for unmarried women, and capable of accommodating as many sleepers The whole of these looked clean and airy, and the rooms seemed to be well warmed and ventilated.

Within the building, on the ground floor, is an emigration office, where the business of the emigrants is transacted under the superintendence of Mr. Smith, whom the Government commissioners have deputed to manage the embarkation by the Mangerton, and who also undertakes the duty of exchanging all moneys belonging to the emigrants, where required, for colonial currency, an arrangement which cannot fail to be highly beneficial to the parties concerned, who might otherwise be liable to the notorious frauds so frequently practised by disreputable "dollaring" agents in this town upon the unwary Moreover, the emigrants, in order to prevent the risk of their being duped by sharpers, are not allowed to leave the "home," until the sailing of the ship, without his permission, nor are strangers admitted to the building without an order for that purpose from authorised parties To enforce these regulations, a police-officer is constantly stationed at the entrance-gate. Adjoining the office alluded to is a provision store, whence the daily rations are served out in conformity with the dietary appointed by the commissioners; and in front is the cooking establishment, excellently fitted up, and conducted in the most quiet and orderly manner. There is a washhouse and drying-shed adjoining the building, in which we saw several of the female emigrants busily engaged in preparing for their approaching departure.

The Mangerton, which is to convey the emigrants to South Australia, is a substantially-built, full-rigged ship, of 960 tons old, or 1100 tons burthen; new measurement. She was constructed at Quebec is classed A 1 for six years, and is nearly new, having been previously out one voyage. She has a poop [illegible], and is roomy and commodious throughout, her between decks being nine feet high, and measuring about eight to the beams. Her berths are constructed to carry 166 married males females in the mid-ships, 90 single adult males in the after and 80 females forward. We understand that the whole of these berths are engaged; and, reckoning upon non-adults in the usual way, it may be estimated that the ship will carry about 340 persons.

All the internal arrangements are admirable, and the accommodations superior to those generally provided in emigrant ships. Every precaution has been taken for the due separation of the sexes, to preserve decorum, and to secure the efficient protection of females during their long voyage, and for the sick, two excellent hospitals, for males and females, have been furnished with every requisite which experience could suggest.

We saw a considerable number of the emigrants, who looked cleaner, better clad, and more healthy and cheerful than persons in similar circumstances ordinarily appear. We were informed that they are chiefly from Ireland, and must have been drawn from the most vigorous and desirable classes of its population. Several passengers however, are from different parts of England, who have been sent down to the "Home" by the Emigration Commissioners. This is a step in a right direction we hail with pleasure. According to the evidence given before Mr. Sidney Herbert's Emigration Committee, in the last session of Parliament, a most frightful state of things prevails at our emigration ports The emigrant is robbed right and left before he leaves this country. The emigration sharpers at Liverpool have now become so numerous, and their gains so considerable, that th[illegible] positive necessity to endeavour to expose their frauds, and to destroy them root and branch "Mothers," says the *Liverpool Albion*, "with their helpless offspring, come here to avail themselves of those facilities which Liverpool affords to emigrants, but, instead of obtaining that protection and sympathy which their helpless condition demands, they are frequently robbed of that portion of their hard earnings which their husbands transmitted for the purpose of bringing them out to their new homes Those," continues our contemporary, "who have inquired into the awful prevalence of prostitution in this town with a view to its prevention, are aware that a very large proportion of these unfortunate women came here with unspotted characters and innocent hearts, and having been deprived of their little savings by the cruel system above referred to, they were driven to a life of infamy by the demands of hunger" We fear that emigrants themselves have to thank themselves for many of the ills they bear, they are weak and ignorant. What is needed for them are emigrant homes. We rejoice to find that so far as Government is concerned in this matter, something has been done

LITERARY NOTICES

JOHN CASSELL *informs his readers that a New Weekly Newspaper will appear on Monday, March the First, under the name of* THE FREEHOLDER AND COMMERCIAL ADVERTISER. *It will be published every Monday Afternoon, price* FOURPENCE, *and will contain Monday Markets It will be then, as now, the Organ of the Freehold Land Movement but it will also aim to be the best General, Family, Commercial, and Literary Newspaper existing* THE FREEHOLDER AND COMMERCIAL ADVERTISER *will advocate Free Trade in Land, Religion, and Labour the Organ of a great and growing movement, it must ensure extensive support No pains will be spared to make it a first-class paper, and published at so small a price*—OFFICE 335, STRAND.—*Order of Newsmen*

The volume of JOHN CASSELL'S LIBRARY *published on the 1st inst. comprised an interesting and instructive work, entitled, "The History of the Steam-Engine, from the Second Century before the Christian Era to the Time of the Great Exhibition." Each department of the subject rendered familiar to the general reader by explanatory diagrams and engravings of ancient and modern steam-engines. Price 7d., in stiff covers*

JOHN CASSELL *also informs his readers that the First Volume of* SCRIPTURE LIBRARY FOR THE YOUNG *is now ready, in ornamental cover, embellished with Twelve Beautiful Engravings, price 1s. 6d.—"The Tabernacle its Priests and its Services."* LIST OF ILLUSTRATIONS

1 *Rearing of the Tabernacle.* 2. *Mount Sinai.* 3 *Altar of Burnt Offering.* 4. *Brazen Laver* 5. *The Golden Candlestick.* 6 *Table Shewbread* 7 *Altar of Incense.* 8 *High Priest in the Tabernacle* 9 *Priests* 10. *Levites* 11. *Nadab and Abihu.* 12. *Feast of Tabernacles.—The Second of this Series of Books, "The Life of Joseph," is ready in a few days.*

MISCELLANEA.

THE ROSE.—Professor Agassiz, in a lecture upon the trees of America, stated a remarkable fact in regard to the family of the rose, which includes among its varieties not only many of the most beautiful flowers which are known, but also the richest fruits, such as the apple, pear, peach, plum, apricot, cherry, strawberry, raspberry, blackberry, &c; namely, that no fossils of plants belonging to this family have ever been discovered by geologists! This he regarded as conclusive evidence that the introduction of this family of plants upon the earth was coeval with, or subsequent to, the creation of man, to whose comfort and happiness they seem especially by Providence to contribute.

TAKE CARE OF THE PENCE.—The Rev J B Owen, M.A, of Bilston, in the course of a lecture recently delivered in the Corn-hall, in connection with the Church of Eng[illegible] Institution, and which has since been published in a separate form, upon "Popular Insurance," related an anecdote strikingly illustrative of the power which lay in the hands of working men to promote their own social comfort and independence, if they would only exert it. A Manchester cotton printer was, on his wedding day, persuaded by his wife to allow her two half-pints of ale as her share. He rather winced under the bargain, for though a drinker himself, he would have preferred a perfectly sober wife. They both worked hard, and he, poor man, was seldom out of the public-house as soon as the factory closed. The wife and husband saw little of each other except at breakfast, but, as she kept the [illegible] of her, and made her [illegible] a selfish allowance for housekeeping and the demands upon her, he never complained. She had her daily pint, and he, perhaps, had his two or three quarts and neither interfered with the other, except, at odd times, she succeeded, by dint of one little gentle artifice or other, to win him [illegible] or two earlier at night [illegible] then to spend an entire evening in house. But these were rare occasions. They had been married a year, and, on the morning of their wedding anniversary, the husband looked askance at her neat and comely person with some shame of remorse, as he observed, "Mary we'n had no holiday sin' we were wed, and, only that I haven't a penny i'th' world, we'd take a jaunt to the village to see the mother?" "Would'st like to go, John?" asked she, cheerily answering [illegible] "If she'd like to go, John, I'll stand treat." "Thou stand treat" said he, with half a sneer; "has got a fortun', wench?" "Nay," said she, "but I'n gotten the pint o' ale!" "Gotten what?" said he. "The pint o' ale," was the reply. John still didn't understand her, till the faithful creature reached down an old stocking from under a loose brick in the chimney, and counted out her daily pint of ale in the shape of 365 threepences (s.e., £1 11s. 3d.), and put it into his hand, "Thee shalt have thee holiday, John." John was ashamed, astonished, conscience-smitten, charmed. He wouldn't touch it. "Hasn't thee had thy share? then I'll ha' no more," he said. They kept them wedding-day with the old dame, and the wife's little capital was the nucleus of series of investments that ultimately swelled into a shop, factory, warehouse, country-seat, a carriage, and, for aught we knew, the mayor of Manchester at last.

MR. HUME'S CLAIMS UPON POSTERITY—Mr. Disraeli, in his "Life of Lord George Bentinck," pays the following high compliment to the veteran Member for Montrose:—"Mr. Hume towers among them (his own party) without a rival. Future Parliaments will do justice to this remarkable man, still the most hard working Member of the House of which he is now the father. His labours on public committees will be often referred to hereafter, and then, perhaps it will be remembered that, during a career of forty years, and often under circumstances of great provocation, he *never lost his temper*.

THE FIRST SHAVERS.—The practice of shaving probably originated at first from it being found that the beard afforded too good a hold to an enemy in battle; and for this cause shaving was originally practised among the Greeks, who continued in it until Justinian's time, when long beards came again into fashion, and so remained until Constantinople was taken by the Turks. The Romans appear to have derived the custom of shaving from the Sicilians, who were of Greek origin, and the refinement of daily shaving was first introduced by no less a personage than Scipio Africanus. At the close of the Republic beards were rare, and some of the Emperors lived in great fear of having their throats cut by their barbers. For the sake of hiding the scars on his face, the Emperor Hadrian wore a beard, and this, of course, brought that appendage again into use, but the custom did not long survive him.

COOLNESS.—The following orders, conveying great comfort to the souls of the passengers who heard them were given by the captain [illegible] boat, when she was about to engage in a race with another steam boat. "Rosin up bear, and tell the engineer to shut down the safety valves. Give her gross. Gentlemen who haven't stepped up to the captain's office and settled will please to come to the ladies' cabin till we pass that boat or bust. Fire up! Le[illegible]

The *Daily Mail* was [illegible] other day, and he and a little girl [illegible] seven years of age, ask an [illegible] man. "If he would be her father [illegible] son, as she was the reply. "Oh precocious country woman [illegible] Hume,' don't you know, if you'd b[illegible] I sha[illegible] off for l[illegible]

A Lu[illegible] pe[illegible] tablished at Circle[illegible] ville Ohio. The editor in his prospectus says:—"Our terms are two dollars a year. Gentlemen who pay in advance will receive a first-rate obituary notice in case of death."

VERACITY.—A mortal fever prevailing on board a ship, at sea, a negro was appointed to throw the bodies overboard. One day, when the captain was on deck, he saw the negro dragging out of the forecastle a sick man, who was struggling violently to extricate himself from the negro's grasp, and remonstrated against being buried alive. "What are you going to do with that man, you black rascal?" said the captain. "Going to throw him overboard, massa, 'cause he dead," replied the negro. "Dead, you scoundrel?" says the captain. "Don't you see he moves and speaks?" "Yes, massa," said the negro. "I know he say he no dead, but he always he so nobody know what to 'bleve him."

A REASON.—A minister was walking out [illegible] day, and as he passed two little boys, one of them made a bow. As he turned his back, he heard the following amusing conversation.—"Why, John, didn't you know that was parson M?" "Yes, of course I did." "Well, why did you not make a bow to him?" "Why, my mother don't belong to his church."

LOGIC.—A gentleman asked a country clergyman for the use of his pulpit for a young divine, a relation of his. "I really do not know how to refuse you," said the clergyman, "but if the young man should preach better than [illegible] my [illegible] would be dissatisfied with [illegible] and if he should preach worse, why I don't think he's fit to preach at all!"

"QUARTER! QUARTER!"—In a recent sketch of an old pensioner's death and career, it is said that he was the man (a Highlander in Picton's brigade) who when a little Frenchman at Waterloo cried 'Quarire, Quartre!" answered, 'Quarter ye? We have no time to do tat, sae ye maun gien be contented to be cutted in twa.' This is of a piece with the story of a Frenchman who was hanged at Tyburn, exclaiming 'Misericorde! ah, Miser-i-corde!' 'Measure the cord!" said the indignant hangman, 'measure it yourself!"

SMALL TALK.—Nobody abuses small talk unless he be a stranger to its convenience. Small talk is the small change of life: there is no getting on without it. There are times when "'tis folly to be wise," when a little nonsense is very palatable, and when gravity and sedateness ought to be kicked down stairs. A philosopher poor figure in a ball room, unless he leaves his wisdom at home. Metaphysics are as intrusive in the midst of agreeable prattle, as a death's head on a festal board. We have met with men who were too lofty for small talk, who would never talk of their servants or—the weather. They never condescended to play with a ribbon or flirt a fan. They were above such trifling: in other words, they were above making themselves agreeable, above pleasing, and above being pleased. They were all wisdom, all gravity, and all dignity, and all tediousness, which they bestowed upon company with more than Dogberry's generosity. A man who cannot talk is no more business in society than a statue. The world is made up of trifles, and he who can trifle elegantly and gracefully is a valuable acquisition to mankind. He is a Corinthian column in the fabric of society.

SIR J FRASER A RECOMMENDATION.—A Madrid journal contains the following:—General Shelly, on passing a review of a cavalry corps, a few days ago, had this dialogue with a soldier:—'Which is the best horse in the squadron?' said the general. 'The horse No —, general.' 'What qualities has he which makes him the best?' 'He runs and leaps well, has no defect in his limbs or health, is fat, carries his head high, has good blood, and is in the prime of his age.' 'And who is the best soldier in the squadron?' 'The best soldier is I de T.' 'And why is he the best?' 'Because he is an honourable man, is obedient, clean, takes care of his equipments, his arms and his horse, and is exact in the accomplishment of all his duties.' 'And to whom does the best horse belong?' 'It is mine, general.' 'And who is the best soldier?' 'Your humble servant, general.' The general laughed, and gave the man a present of money, which he received with imperturbable gravity."

THE PIOUS ROGUE.—"Have you more of which your conscience should be purged?" said the venerable Father Anselm, addressing a kneeling sinner at the confessional. "Yes, holy father," replied the penitent; "I have committed the foul sin of theft, I have stolen this watch; will you accept of it?" "Me!" exclaimed the pious priest—"me receive the fruit of thy villany! How darest thou tempt me to the commission of so abominable a crime? Go instantly, return the watch to its owner." "I have already offered it to him," replied the culprit, "and he refused to receive it again, therefore, holy father, I beseech you to take it." "Peace, wretch!" rejoined Anselm, "you should have repeated the offer." "I did repeat it, holy father; and he persisted in the refusal!" "Then I must absolve thee from the sin thou hast committed." The purified Catholic had scarcely departed, when the astonished father discovered that his own watch had been stolen from the place where it had been deposited near the confessional.

When Lord Holland was dying, George Selwyn called at Holland House, and left his card. It was carried to the dying statesman. Glancing at it for a moment, he observed with a mournful pleasantry, "If Mr. Selwyn calls again, show him up, if I am alive I shall be delighted to see him; and if I am dead he would like to see me."

WHY don't you put on a clean shirt?" said a swell the other night to his companion; "then the girls will smile upon you as they do upon me." "Everybody can't afford to wear a clean shirt every day as you can," was the reply. "Why not?" said white collar. "Because," said so. ——, "everybody's mother is not a washerwoman."

HUMAN HAPPINESS.—There is no point in human existence on which any child of Adam can place his finger, and say, "Then I was happy!" When the stream of life is gliding most pleasantly along, there will still be found some under-current crossing its progress, and which, if not seen foaming on the surface, is too surely felt troubling its onward tranquillity.

A GOOD RIDDANCE.—At Lowell, a young married girl and a bachelor ran off, the husband saw them as they got seated in the cars, gave them three cheers, waved his hat, bade them enjoy themselves if they could, and then went home a happy man.

The story is told of a certain New Zealand chief, that a young missionary landed at his island to succeed a sacred teacher deceased some time before. At an interview with the chief, the young minister asked, "Did you know my departed brother?" "Oh, yes! Me deacon in this church." "Ah, then, you knew him well, and was he not a good and tender hearted man?" "Yes," replied the pious deacon, with much gusto, "he very good and very tender. Me eat a piece of him."

RECOLLECTIONS OF A WELL-SPENT SUNDAY.—The return of every Lord's Day (says Bishop Wilson) brought along with it an especial blessing, either ... advice or some reproof; some duty I had forgot, or some sin I had unwarily fallen into. These I received as messages from God, and ordered my life accordingly, and now I have the comfort of doing so, when I most stand in need of it.

ANSWERS TO CORRESPONDENTS.

ROBIN HOOD will find much of the information he wants in Miss Strickland's "Lives of the English Queens."

AUSTRALIA wishes to go to Australia. He is twenty-one years of age, writes a good hand, and can serve as a house-painter—not a very lucrative profession in Australia. We, however, recommend him to go: he has a better chance there than here. The cost of the voyage is—steerage, with provisions, from £15 to £20. It is not at all likely "Australia" can procure a Government pass, but "Australia" will be better informed on this subject if he writes to J. Walcot, Esq., secretary to the Emigration Board, No 9, Park-street, Westminster. We may as well tell "Australia" that the commissioners do not place money in the hands of emigrants; they, on the contrary, exact certain payments from the emigrant, according to age and ... stances, and, having made these payments with certain regulations, they are taken ... charge of and sent out.

A WORKING MAN writes to complain of the ... us to observe, ... He says, that we do ... "A Working Man"

... humble opinion, I differ to the ... as "A Working Man" proves ... We will ... A Working M... by reminding him of the epitaph ... on an grave of a German student. It is short, but expressive—"I was well, I took physic, ...

A B—A "Handbook on Lingraration" is now preparing at our office, which will contain all the information you need. It will shortly be ready.

X Y Z wishes to know how to get rid of spots and pimples on the face. In most cases, we believe, they arise from unhealthy habits, and indigestible food. Few people who live temperately, take plenty of exercise, and wash themselves thoroughly—not merely the hands and face, but the body as well—are troubled with them. Children require much more sleep than grown-up people. We suppose the reason why people oversleep themselves is that they are lazy and sleepy, or tired, and X Y Z, if he had thought of the question a moment, would have come to the same conclusion, and thus saved us the trouble of answering it.

RAMSDEN.—In writing for the press, in order to have a word printed in Italics, it is usual to underline it. In sending a contribution to a periodical, it is unnecessary to send anything by way of preface, or introduction: the piece will speak for itself. Writers often do—generally, ... regards the acceptance or rejection of the article, it matters not a pin.

HENRY SNOOK (what a name!) will find the Gazetteers in most of the cheap sixpenny atlases. As to an atlas, we hardly know what to recommend. He had better ask the nearest bookseller, and he can tell him the price. The atlas must depend upon the price Snook feels inclined to pay for it. We may recommend one that costs £5, when Snook may not feel inclined to pay more than 5s.

A CONSTANT READER of "THE WORKING MAN'S FRIEND" would have done much better if he had gone to the parish clerk, and asked what were the marriage fees, than written to us. We believe in some parishes, at certain times of the year, marriages are performed gratis. We believe the fees vary in different localities, and that you get the blessing of a wife much cheaper in some parishes than in others.

J W—It is a figure of speech when ... the heart with intellectual or moral gifts. You ask, Do our thoughts lie in our hearts or heads? We should say the latter. The brain seems to be the seat of the reasoning faculty. Accordingly as the brain is developed we find intellectual power; but the brain itself is but matter—we must trace thought further still, to the inspiration ... might ... when the earth rolls round we do not roll off. The answer is, we are kept on its surface by the law of gravitation, which attracts all matter to the surface of the earth, and by means of which the stars and planets roll harmoniously in their pathway along the heavens.

S. F.—If you wish to learn French, you should procure the "French Lessons" and "French Manual" published at our office. They have been extensively used, and with the utmost success.

J. S. D. wishes to know if any of the descendants of the poet Sir J. Denham are living; and, if so, where they reside? We cannot answer the question, perhaps some of our correspondents can.

H. T.—A striking instance of the folly and ignorance of people at this time of enlightenment, as we call it, is seen in the rise and progress of *that detestable delusion called Mormonism*. The *New York National Police Gazette* contains a mass of disgusting details relative to the proceedings of this sect at the Salt Lake. A correspondent of that paper, writing from Utah, says:—"The pluralist wife system is in full vogue here. Governor Young is said to have 90 wives. He drove along the streets a few days ago with 16 of them in a long carriage, all of them having each an infant at her bosom. It is ... Heber C. Kimball, one of the Tri... Council, and the second person in the Trinity, has almost an equal number, and among them ... ...

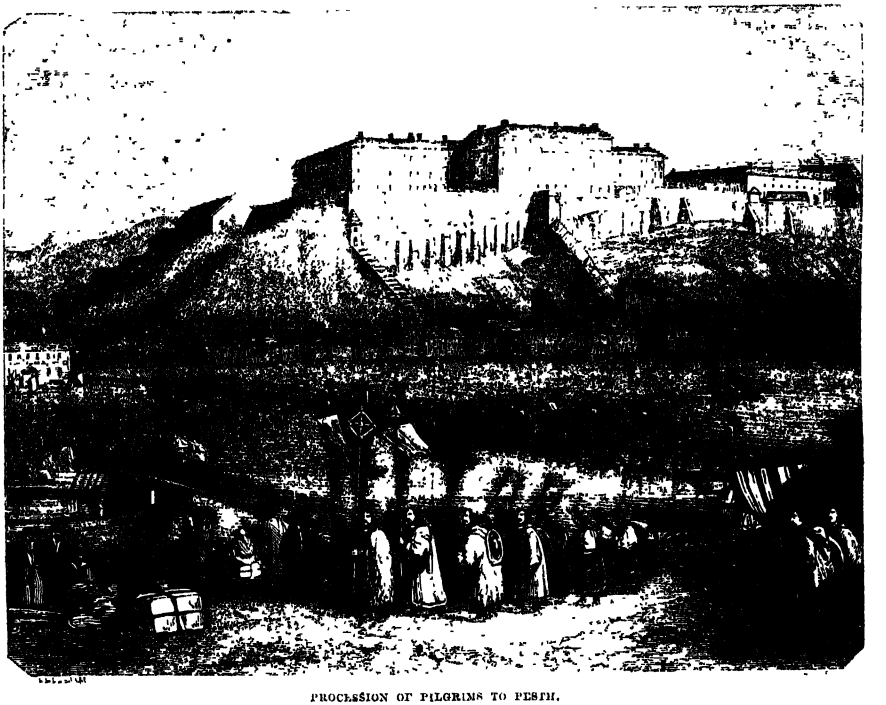
BUDA ON THE DANUBE.



BUDA is also called *Ofen* by the Hungarians, and stands on the right bank of the Danube, opposite Pesth. The palace and citadel which crown a lofty eminence, were almost entirely rebuilt by Maria Theresa. Its churches partake very much of the oriental style of architecture—their towers being rounded off abruptly, like the domes of the mosques, and covered with lead. Buda is the present capital of the kingdom, and is the residence of the Prince Palatine, and the other high functionaries of the government. The crown of St. Stephen, to which the Magyars attached an almost superstitious importance, was kept in the imperial palace, but disappeared during the late war.

The higher nobility live in Buda only during the winter; and during the summer it appears almost deserted.

Pesth is situated at the extremity of an immense plain, and is the largest town in Hungary. The houses being all built of a sort of granite, and the streets being in general wide and regular, it has a very fine appearance. It possesses a good many large woollen manufactories. The University was once very flourishing, having a revenue of £35,000 annually—a very large sum in a country like Hungary, and having 1,700 students on its books.

A bridge connects Buda and Pesth, and makes them in reality one town; the inhabitants of both join on all civil and religious *fetes*. From the heights of Buda, the view is, perhaps, one of the most magnificent in the world.

The great religious devotion of the Hungarians, causes those of them who are Roman Catholics to pay more than ordinary attention to the ceremonies of the Church. Processions are, therefore, of frequent occurrence, and the great taste of the people for show and magnificence in matters of dress makes these ceremonials surpass those of any other country in the world in the splendour of costly decoration. The crowds of pilgrims which annually assemble from all parts of the country to offer their homage at the shrine of the Virgin, and Catharine, the patroness saint of the kingdom, have often astonished strangers. Our engraving represents a band of these passing across the bridge on their way to Pesth, with the banners and crucifixes, and all the other paraphernalia of Romanist devotion.

PROCESSION OF PILGRIMS TO PESTH.

MARRIAGE CEREMONIES.

By Xantmus.

Nearly all nations naturally attach great importance to marriage ceremonies, associated as they generally become, in the memory of almost every individual, with the chief event of his life; and the attendant festivities, sacred and profane, are so variously modified by climate, civilisation, and whatever contributes to the formation of national peculiarities, that it may not prove an uninteresting task to compare the nuptial celebrations of other countries with those of our own. They present every variety, and though affected more or less by the indolent, or poetic, the energetic, or superstitious temperaments of different nations, we think it will generally be found that in proportion as women are reverenced, and as civilisation becomes far advanced, marriage festivities are conducted with proportionally increased solemnity and simplicity. Let us see how such matters are arranged in the South Sea Islands. There, if the union contemplated is between parties of rank, four large piles of plantains, yams, cocoa-nuts, bread-fruit, fish, cakes, bananas, with a baked pig on the top of each are, early in the morning, arranged in front of the house of the bridegroom, and the spectators assemble round them decked in new dresses, and their bodies anointed with sweet oil. Then the bride, closely veiled in fine matting made from the bark of the mulberry tree, is brought to the same place, and her feet, hands, and face being first anointed with sandal wood and tumeric, she takes her seat, and mock duels with clubs are performed in her presence, followed by boxing and wrestling matches, after which the bride and bridegroom, accompanied by their friends, who sing as they walk, enact a sort of procession before the spectators, who greet them with loud acclamations. The bridegroom then commences a dance with his young men attendants, during which the bride is led into her future habitation, the heaps of provisions are next distributed or scrambled for, succeeded by another boxing match, and the lighting up of the abode of the bridegroom, with singing and dancing in the evening, conclude these somewhat barbaric festivities. Those of the Tartar races are quite dissimilar, yet equally unlike our own, and as each man may possess four wives, it is not surprising that the affair becomes one of barter, and the price of a woman, varying, according to her beauty, from 20 to 500 rubles, is first determined upon between the father and the suitor, after which the latter is permitted to pay his respects in person to his future bride. When the price agreed on has been all disemboursed, the young woman's companions come to her father's house the evening before the wedding, and the female ones offer condolences on her quitting the parental roof, which are responded to by two male friends, who sing songs meant to inspire her with happy hopes for the future. The following morning the young couple stand up in presence of the mollah, who asks if they will wed one another, he next repeats a prayer, and bestows on them the nuptial benediction, and the bride is then seated on a carpet, and carried to the house of the bridegroom, where festivities are continued for many days, consisting chiefly of dancing and music. The Russian peasants, though near neighbours to the Tartars, have customs on such occasions peculiar to themselves, and which are believed by some antiquarians to be derived from the Greeks. The lover, accompanied by his bride-man, goes first to the lady's abode, and the friend says to the mother, "show us your goods; we have money." He is then permitted to enter the bride's apartment, and afterwards gives the lover a description of the girl and her possessions. The next day the lover exacts a similar privilege, only he experiences more difficulty in inducing the bashful fair one to show herself, if he is then satisfied, the betrothing is not long delayed; on which occasion the young people kneel to receive the father's blessing who places one of the household saints on their heads during the ceremony; rings are interchanged, and the bride gives out handkerchiefs to her female friends for them to embroider, and which she presents on the wedding day to her husband and his friends. On the preceding afternoon she is conducted to the bath, her companions singing lamentations, at the prospect of losing her, while they walk through the village. The same parties thus chaunt before setting out to church:—"A falcon flies in pursuit of a dove. Charming dove are ye ready? Your mate is come to seek you." "Yes," is answered, with sighs. The saint's image accompanies the party to church, and when the priest's benediction has been pronounced, the bridegroom by legal rights takes his bride by both ears and kisses her; the young maids remove her virgin head-dress, replacing it with the marriage insignia, and then all return home to make merry, and the bridegroom throws nuts on the ground to indicate his renunciation of all boyish sports.

Less poetical than weddings thus accompanied by song, the African observances would not be at all relished by the English fair sex. Not only is the nuptial engagement an affair of merchandise, in which the bride's father sells his daughter for so many oxen, and slaves, but the girl's nominal consent is not considered necessary, and as soon as ever the price is paid, and perhaps on the same evening, the young girl selected is decked in a white veil of her own weaving, and attended by her own friends she goes to the bridegroom's house, where she takes off her sandals, and a calabash of water is given to her; she knocks at the door, which being opened, discloses the bridegroom seated in state, surrounded by the elders of his family; going up to him, she kneels before him and pours the water over his feet in token of her entire submission to his will. In curious contrast to this insulting want of even decent attention towards the bride amongst the swarthy Africans, are the antique ceremonies observed by the superstitious Hindoos, but they are so tediously long drawn out we must endeavour to compress our account of them as much as possible. The father makes the proposal on behalf of his son, which is always done on a lucky day, before a reply is given, the bride's father pays a similar visit, after which, with great pomp, the other parent accompanies his son, who makes gifts to the bride, one of which is a piece of silk to be worn on the wedding-day; his father then presents four to six guineas with some betel to the bride's father, saying. "The money is thine and the girl's mine." The answer is *vice-versa*, and a Brahmin repeats a certain formulary which closes the betrothment. A lattice-work bower is now built in the court-yard, and from ten to thirty days, festivities are carried on, and friends call, and the interval so spent is equivalent to our reading of the bans in the church. Offerings are made to propitiate the god of marriage, and the young couple ride on elephants to return their friends visits in the evenings, when fire-works and illuminations add to the pomp kept up in all conceivable ways. For fear any evil eye should have been turned upon the lovers during these evening processions, a piece of cloth is torn in two in their presence, and the pieces thrown in opposite directions; and on the wedding-day Brahmins arrange themselves on a raised platform, surrounded by jars of water, the two largest being placed on it by the lovers, and prayers are offered up to bring down the deity into one of them. The sacrificial fire is then kindled, and oil, butter, rice, incense, &c., are thrown into it. The nuptials are performed by a Brahmin, who at the conclusion breaks a cocoa-nut in two, and then blesses the tali, or piece of gold, worn by all married women, which is placed round the bride's neck by the bridegroom, who swears before the fire to take care of his wife. All present sprinkle rice, mixed with salt on, over the shoulders of the newly-married, and repeat prayers as they do so, which is their mode of bestowing a benediction on the union.

Amongst the Turks, marriages are generally those of convenience, and are arranged by the parents in presence of a notary, the bride's dowry being her own to reclaim in case of separation. On the eve of the wedding, she goes to a public bath, where she is met by a large company of friends and relatives, and, in bathing costume, she walks round the bath; her bridesmaids, similarly attired, singing, as they walk beside her, a sort of epithalamium. Every one then salutes her, and presents her with jewels and other gifts, in return for which she kisses their hands. The succeeding morning she puts on a red veil, bordered with yellow, and in a close carriage, which entirely screens her from view, she is conveyed to the bridegroom's house, preceded by trees borne aloft, from which hang waving festoons of gold and silver thread, while musicians and mountebanks divert the people, who give a luminously on the string of horses loaded with the bride's effects, and her relatives, richly dressed, who follow in carriages.

Festivities are kept up for some time; but as the sexes are not allowed to intermingle, they can hardly be called of a social order, and chiefly consist in performances to be looked at, such as puppet-shows, dancing with castanets, and optical deceptions.

Marriages amongst the North American Indians form rather an exception to the rule of increased simplicity, in proportion to the advance of civilisation, for their festivities regularly brief and simple. A young "brave," whose courage has been tested in many skirmishes, who can exhibit plenty of scalps, and who is a good hunter, easily wins the favour of his Indian bride, and then seeking her father, while she stands by, he offers presents to the old man, who, if he is pleased with them and with the suitor, takes the hands of the young couple, and, joining them together, the quiet ceremonial of the union is completed, and is followed by a little feasting.

In Spain the warm climate and romantic temperament of its people are exhibited in the poetical ceremonies attendant on courtship and marriage. When a mutual understanding has taken place between the young people, a night is appointed for the betrothment, and the lover seeks the fair one's abode, which is decorated with festoons of flowers. He is accompanied by torch-bearers, musicians, and attendants, who form a circle round the house, and a serenade is performed of the most flattering kind; and when she has been sufficiently wooed, the coy maiden opens a little window, and asks what the gentleman wants? This leads to another rapturous burst of musical tenderness, and at last the lady throws down the garland from her hair, and promises everlasting constancy, the musicians immediately strike up a triumphant allegro; the windows are illuminated; the maiden and her parents come out and conduct the serenaders into the house; and firing of guns and shouts of joy resound through the calm, delicious night-air of Valencia. The day of the marriage is celebrated with musical entertainments, horse-races, and divers other amusements, and at midnight the bridegroom bears away by main force the bride, who is detained as long as possible by companions, to the beautiful arbour adorned for the retirement on the terrace upon the roof of the house.

The wooer of the Swiss cantons commences his courtship by the more truly romantic offering of a bouquet of flowers, gathered on the brink of a precipice, and to see his beloved, he is often forced to journey many leagues over the mountains at night, exposed to the risk of being waylaid by jealous rivals. When the object of his nocturnal wooing has been accomplished, the [illegible] is fixed, and, preceded by musicians and b[illegible] m[illegible] decked in gay ribbons, the young people walk to church, followed by a woman bearing a basket of flowers. The bride is dressed in a plaited apron, red hose, a floral crown, and a [illegible]macher, upon which are inscribed her Christian and surname, and the date of the year, and the chief bride-man holds her by her apron. When the religious forms are completed, the spectators obstruct the way of the bridal party, who are obliged to give them wine before they can proceed to the village public-house, where the festivities are to be held. Here Swiss dances are succeeded by the appointed person taking off the bride's virgin crown, and [illegible] cracking indicates that the young couple must not expect to be free from mankind's common portion of ill fortune during their future career. Food is also distributed to the poor in the adjoining meadow, and, with the simple fervour of religious faith in mountainous countries, the newly-married are then conducted to the bridegroom's house, which everybody enters, after first kneeling down and praying for the welfare of the young people.

The Illyrians and Dalmatians are descended from [illegible] mixed races of men, that a great number of curious nuptial observances yet linger amongst them, and vary in the different provinces, although the main ceremonies differ little from the Swiss and Spanish customs, which we have already described. One of these varieties is one common amongst the Romans, and still kept up by the Morlachians, of presenting the bride, after the marriage is consummated, with a sieve full of walnuts or almonds, which she throws amongst the bystanders, to signify that plenty will prevail in her house. The Illyrians usually appear well armed, and have their hats adorned with peacock's feathers, in compliance with ancient prejudices, on nuptial occasions; and, even now, bloody encounters are too common, when rival suitors insist on such trials of skill. As their wedding lasts several days, each guest is daily furnished with a small tub of water wherewith to wash himself, and each leaves in the tub some money for the bride, which thus augments her little dowry, of one cow and her wearing apparel. In some districts a ridiculous custom is observed, of the parents depreciating their daughter in set speeches before she is conducted to the house of the bridegroom, who says, in return, to the young wife, "Well, I shall find means to bring you to reason, and to begin with you in time. I shall let you feel the weight of my arm." He then pretends to beat her, though this part of the business is not always confined to a mere form. Another curious ceremony at Illyrian weddings is during the wedding dinner, in the midst of which, all the company rise up, and the bride is expected to throw over her husband's house a cake, made of hard coarse dough, the higher she can do this, the happier will the marriage prove and if the cake falls on the other side without breaking, it is considered a convincing proof that she will make a good housewife. The firing of pistols is common in these provinces on festive occasions; and, sometimes for a week before the wedding, a bride is expected to kiss all the men who come to see her, in token of the regard which she shall henceforth feel for the sex of her husband, and, on the day of her marriage, the bridegroom's friends ride forward and present her with a white silk handkerchief, which she returns, and the messengers [illegible] to the rest of their party, amongst whom the [illegible] and who, ranging themselves in a circle, partake of refreshments, amidst the discharge of fire-arms. On arriving at the bride's abode, the attendant maidens fasten an apple, encircled with flowers, to the top of the standard-bearer's lance, and, on reaching church, the bride is the last to alight, though she has the privilege of assisting her father-in-law to dismount.

The marriage ceremonies of the Tyrolese are more interesting, for they are evidently dictated by a truer sensibility. It of this nation beseeches the sanction of his parents to his choice, for them to reply—"Go, earn thy wife. To be a good father, a man must be able to get bread for his children;" and the young man dutifully obeys the mandate—the operation of which frequently banishes him to distant countries, with merchandise to dispose of, or other commissions, entailing the expenditure of a long period of time, much trouble, and patience. If, after this trial, he persists in his constancy, the father and son array themselves in their best apparel, and with presents of honey comb, [illegible] on sweet-scented plants, fine fruits, and cakes, made by some beloved sister, they visit the future bride, to whom the father says, "God bless thee, lovely girl, who remindest me of the days of my youth. I have a son; he loves thee. Wilt thou be a happy one?" She modestly replies, and the lover is then introduced, lays his gifts at the feet of his mother-in-law, when singing by the young maidens present, and a frugal repast follows; and in the evening the lover serenades the fair one for whom he has so long waited. Music forms an important item in the wedding-day festivities, [illegible] choolmaister addresses a complimentary speech to the bride, who afterwards delivers to her future spouse the ribbons for his garters, in token of submission. In church, before the priest pronounces the final benediction, the white-robed bride and gaily-decked bridegroom kneel to receive their parents' blessing, and after the marriage dinner, the head of the family offers up a solemn prayer for the happiness of the young couple, and, as the evening wears on, dancing begins, and the bride, in return for their congratulations, presents flowers to each of the young men; while the bridegroom, in like manner, gives different coloured ribbons to the fair maidens, who, in turn, have offered him their good wishes.

It is said, and it is greatly to her credit, that in no country are matches of interest less common than in Holland. When a maiden of the Netherlands has signed her consent to her lover's proposals, her apartment is decorated with garlands, and in country places a triumphal arch is erected before the house, and, for some days, the betrothed receive visits of congratulation every forenoon from friends and relatives, who are offered wines and liquors, which on these occasions are termed bride's tears, bottles of which, decked with white and

green ribbons, and square boxes of sweetmeats, are also sent round to all acquaintances, instead of bride-cakes. The marriage day ceremonies present no new features, unless it be the invariable presence of blanc-mange at the banquet, which is called "the bride's strengthener;" and at the conclusion of the ball the bridegroom is generally forced to promise the bribe of a second treat before he can obtain possession of the lady, which treat is given at the young couple's expense several days after the wedding.

The length of this paper warns us to draw to a conclusion, which we shall do by describing the Hebrew ceremonial of marriage; for what reader needs a recapitulation of the observances of a private English wedding, whose unpretending customs are not the less heartfelt, that they present no barbaric or sentimental, or degrading features, worthy of the pen of the historian? On the night preceding a Jewish marriage, the steward of the bridegroom sleeps with the latter, in order to prevent any evil spirit from having access to him, and when morning breaks, they both adjourn with other male friends to the house of the bride, and are ushered into a room where all the men of the family are assembled. Everyone bows his head to the east as he takes his seat, and a solemn pause of silence precedes the prayers and benedictions then offered up on behalf of the lovers, this little service ended, the bridegroom's steward bears the gifts of the wooer to the women's apartments, where he presents the usual set of presents to the bride—viz., two pair of shoes, one pair of hose, a silk pocket-handkerchief, and a prayer-book. She returns the compliment, by sending to the bridegroom an embroidered bag, for holding the Jewish symbols of faith, which are daily used by the male Hebrews; these are the Zepholim, or certain holy chapters written out on parchment, and leathern straps worn round the arms, with sacred words inscribed on them; she also gives him a Thalis or wrapper, to be used at prayers, and a white shirt or tunic, which he wears at his wedding feast, and once a year on the festival of the Reconciliation, and in which he is buried. When the interchanging of gifts is over, the blast of a trumpet is heard, and the bridegroom is conducted in procession to an apartment wherein is a canopy, beneath which he takes his place. Then the trumpet sounds again, and the bride enters in procession, and after walking round the room three times, to the blasts of the trumpet, she is placed beside the bridegroom, and the priest also stepping under the canopy, reads the marriage contract. The bridegroom puts a ring on the bride's finger, who is then closely enveloped in a thick veil, and is not allowed to be seen again until the following morning; a glass of wine is next brought in, which is consecrated by the priest, and by him delivered to the bridegroom, who drinks the wine, and the glass is placed under his heel, for a sign, that as it could no more be intact, so should his fidelity never be sundered. Another pause of solemn silence ensues, which is broken by loud joyful acclamation while again the trumpet sounds; all present embrace the bride and bridegroom, and each other, and a lively banquet closes the wedding festival of the young Hebrews.*

* Some account of a Swedish marriage, whose rites possess the tenderness and poetical simplicity of the far-north, would not have been here omitted, were it not sacrilege to trespass on a theme which has been so exquisitely portrayed by Professor Longfellow, in the notes to his "Voices of the Night," and which must consequently be too familiar to English readers to need repetition here.

POETRY.—It has long been an easy thing for hundreds of men and women to write verses which have almost the air of poetry. Poets, we know, are rarities, but what tribes of poetasters there are! And if you compare the average verses now with the average of the last century, or even later, how excellent they seem! The poetical commonplaces of our day are of a higher mood. People write verses so correct and musical, so polished in diction, so picturesque and fanciful, that, if not actually *diamonds*, these verses are the very best of paste. It is the same in most things. Elegance has become democratised. The general standard is raised. In manners, speech, furniture, elegance, and literature, things are now commonplace which not long ago were exclusive. It is with poetry as with oak carving, the real work of labour wedded to art is possessed only by the few, but imitation of oak-carving by machinery is to be had cheap enough.

THE MUSIC OF OTHER DAYS.

"We shall be very happy here," said Louisa Burnet to her brother, as they sat down in a neat apartment, the furniture of which they had just been putting in order; "I only wish your room was as neatly furnished."

"As I shall be asleep during the most of the time spent in it," said her brother, "the furniture is a matter of little consequence. The room is every way comfortable."

You must have your office neatly furnished."

It is furnished as I desire it to be, except in regard to books."

You will soon be able to purchase some books. I do not intend to spend another penny for any article of dress this season."

"I had rather go without books than have my sister experience the slightest want."

"You have made such a sacrifice for me, that I must and will deny myself for your sake."

"I shall not permit you to do so, my dear sister. I shall cherish my only earthly treasure just as carefully as I choose."

"I wish," said Louisa, with a tear in her eye, "that our poor mother could know how pleasantly her orphans are situated, and what prospects are before them."

"Perhaps she watches over us now as tenderly as when she tabernacled in the flesh. Her spirit may be present now."

A feeling of awe stole over the mind of the gentle girl. She closed her eyes and remained silent, while her brother gazed upon her beautiful countenance, and resolved that however the world might go with him, no thorns should lie in her pathway, if he could remove them, that no storm should beat upon her head, if he could shelter it.

If," said Louisa, "the spirit of our departed mother be near what joy must it give her to see the son of her solicitude and prayers so tenderly guarding her daughter, and—" her full heart would not allow her to finish the sentence; she leaned her head on her brother's bosom, and wept tears of gratitude and joy.

"I trust our mother would approve what I have done, but I am promoting my own happiness as well as yours."

"You were ever the most self-sacrificing of beings, except my mother."

"Not half so much as yourself, but let us avoid a dispute, even upon such a question. Is there anything else that needs attention here? To-morrow, I wish to give myself heart and soul to the labours of my profession."

"There is nothing else for you to do. If anything occurs, I can attend to it without troubling you."

"How will you employ yourself during the long days?"

"I have the books which your kindness has furnished, and my sewing, and this beautiful landscape to look upon, and I shall have to watch the hour which will bring you to me."

Mrs Hales came to the open door, to inform them that tea would soon be ready. A tear rose to her eye, as it fell upon the affectionate brother and sister. It was not unobserved by Louisa, who invited her to be seated.

"I must sit down with you a moment," said the widow, "for he reminds me of a dear son."

"Is he no longer living?" said Louisa.

"He was so kind and attentive," not seeming to notice the question, "that it was often said to me, after my husband's death, 'What a comfort you have in your son!' I had no more thought that he could ever leave me, than you have that your brother can desert you."

Louisa clung closer to her brother's hand, and made no remark. The words of the widow would imply that her son was a wanderer she feared to ask her. The silence became painful. Burnet said, "Your son is not living?"

"He is not. He died among strangers whether he ever was brought to see the error of his way, and to ask pardon, is known only to God. May you never know anything like the heartaches I have felt for that child. My bitter experience makes me feel anxious when I meet with the young and innocent; and my view of the dangers which lie in wait for them leads me to urge them in the language of Divine Wisdom, 'Keep thy heart with all diligence, for out of it are the issues of life.' If I had not felt so much confidence in my son, if I had prayed for him more, perhaps he would not have fallen. Excuse me for obtruding

my troubles. I did not intend to speak of them when I sat down. I love to see young persons happy. I hope you will enjoy many happy hours under this roof. It has been to me the scene of many mercies."

She then invited them to walk down to tea. The sister laid on the arm of her brother, and looked up to his face with an expression which told how entire was her confidence that he would ever be the faithful supporter and guide which he now was, and had pledged himself to the departed one to be.

The table was spread in an apartment which was shaded by the convolvulus, and sweet-scented honeysuckle: an air of perfect neatness pervaded the apartment. A spirit of subdued cheerfulness reigned in the little circle. They felt that there was sympathy between them. They felt that there were some quiet and peaceful spots even in this storm-swept world

The father of the orphans died when Richard was six, and Louisa three years of age. The mother—a woman of energy, affection, and faith—though left with slender means, supplied the necessities of herself and children. The wants of the minds were not sacrificed to those of their bodies. The son received the advantages of a collegiate education, though at the cost of great self-denial and sacrifice. He was not insensible to those sacrifices, and resolved that they should not be made in vain. A most diligent attention to his studies secured him the highest standing in his class, and a steady and successful resistance of the temptations of a college life, gladdened the heart of his devoted mother. After completing his collegiate course, he engaged in teaching, pursuing, at the same time, the studies of the law He had paid the debts contracted by his education, and was just prepared to enter upon his professional duties, when his mother was called away O death, why dost thou delight to enter those families which, after long struggles are just prepared to live!

The brother and sister were now alone in the world, and were wholly destitute of pecuniary means. Louisa resolved that she would not be a burden upon her brother The labours of a school, or even the drudgery of domestic service, she would willingly bear, sooner than interfere with his professional prospects He was as firmly resolved that she should not lead a life of toil, and that she should not be separated from him An eligible situation was promptly declined by him, because it would involve a separation. The arguments urged by him to induce a concurrence with his plans, failed to move her. She yielded to an appeal to her affection, and his entreaty that she would not leave him alone

It was decided, after many consultations, that he should establish himself in the village of L——, where the prospects of success were far less promising than the hopes held out by his ardent affection to his confiding sister. Lodgings were engaged, and they removed thither With some of the events of the first day of their residence, the reader is already acquainted.

Richard was not without his fears that his resources would prove inadequate to the supply of his sister's wants, but he carefully concealed them from her knowledge. To her inquiries respecting his success, he gave encouraging replies "Why," thought he, "should her fair face be clouded with anxiety? Why should shadows fall upon her path?" It should not be his should be the toil and care. Beautiful, oh brother, is thy fond affection! but far better were it that it be not exercised at the expense of truth

. . . . . .

The summer flowers had displayed their beauty and exhaled their fragrance and departed; and a russet hue began to steal over the landscape, which was viewed, each pleasant evening, by Richard and Louisa, from the heights that overlooked the village. The sister leaned a little more heavily upon the arm of her brother as she ascended the eminence, and her cheek acquired additional transparency. There was something in her general form and carriage which attracted the attention even of the unobserving rustic, and produced a feeling that she was not long to be an inhabitant of earth

The devoted tenderness of Richard for his sister won for him the respect even of those who fail in the lesser duties of affection, upon which so much of the happiness of life depends.

It did not, however, in the same proportion, promote his professional prospects A share of the legal business of the place, perhaps as large as he could reasonably expect, found its way to his office; but the returns were not sufficient to meet his expenditure. This fact he deemed it necessary to conceal from his sister, at the frequent expense of truth.

Mrs. Hales, who loved him for his devotion to his sister, and loved that sister with almost a mother's love, was pained at the deception practised upon the unsuspecting girl. On a fitting occasion she reluctantly called his attention to his fault. "Would your mother," said she (she was well acquainted with their history), "approve of such a course towards one who confides in you with her whole heart?"

"She would not," was his reply, "but what can I do?"

"Tell her the exact truth, and see how nobly she will bear up under it. Give her the privilege of sympathising with you, and of feeling that she has your entire confidence."

"In her feeble state of health it would crush her It is better far that she be kept in ignorance. It is a heavier load for me, but that I care not for, if she is not burthened."

"She cannot always be kept in ignorance, and when the discovery is made that she has been deceived, the pain will be far greater than a knowledge of what you are concealing can occasion."

'That discovery need not be made."

"It will be made There is that in your manner which she will observe, and nothing but the true statement of the case will satisfy her My young friend, permit her to share with you the burden which an all-wise Providence has laid upon you."

"It was by my urging that she consented to come here."

"No matter, confidence—permission to sympathise with those she loves, is all that the heart of woman asks for. I tremble for the happiness of that dear girl, and for your own. He that can resist the claim of duty, though it be in consequence of the pleadings of strong affection, may be led to neglect it from other causes"

"I am sorry, deeply sorry, that it is necessary for me to depart from the truth in any degree, but in my sister's state, the knowledge of my situation would crush her. It would not be safe to tell her the truth."

'It is never safe to do wrong"

'I beg you will say nothing to Louisa on the subject."

'Forgive me for interfering thus far—nothing but my strong affection for her could have induced me to do so. You may be assured I shall not allude to it again"

"Thank you I doubt not your motives are of the kindest nature I regret that inevitable circumstances forbid my following your advice. I hope soon to be relieved from the sad necessity"

"How have you been to-day?"

Louisa's room one evening, and stooped to bestow the kiss which she held up her lips to receive.

"Much as usual I have been rather lonely, but that is of no consequence now that you have come, sit down near me you look worn"

"I have been hard at work to-day"

'You have not to return to the office this evening?"

"It is not absolutely necessary that it should be so,"

"Do not think of it then, stay with me and rest"

'I need a little exercise," said he, throwing his arms in the manner of one performing gymnastic exercises.

'After tea you must take a walk"

'And leave you still longer alone?"

'You will not be gone very long, and it is of more consequence that you should preserve your health, than that I should not be lonely, I will lie down and rest while you are gone, so that I can sit up with you till I wish to retire"

"You will be ready to go immediately after tea," said a young man, now their fellow boarder, as they were seated at the table. Louisa turned to her brother with an inquiring look. The blood mounted to his temples, but she did not observe it.

"My sister insists on my taking a walk then, but we can despatch that business in a few moments. I can take the office in my way. You have the papers in readiness?"

"Yes"

Mrs Hales saw the look of intelligence which passed between the young men, and was satisfied that something was going forward which was to be concealed from the knowledge of Louisa. Her confidence in the moral rectitude of young Hyde was by no means strong, and she had for some weeks marked, with pain, the influence he seemed to be gaining over the mind of Burnet. When they had gone, she followed the lone girl to her chamber, and sat, for several hours, by her side, conversing with her about her dear mother, skilfully suggesting those consolatory

supports of faith which it was probable she would shortly need in a higher degree than at present. When the evening was far spent, she was constrained to leave her, in order to attend to domestic duties.

Hour after hour passed, and Richard came not. She replenished the fire and trimmed the lamp, and watched for the pausing of every footstep. Her anxiety would have been most oppressive, but for the belief that his absence was occasioned by the necessary calls of business. The hour of twelve had passed. All sounds without had been hushed to silence, except the dreary sound of the winter blast through the leafless branches of the locusts which stood before the house. A footstep was heard, it paused. The street door was opened. He had come, his step was in the passage. In her impatience, she rose to meet him at the door of the apartment, but he entered his own room, which was an adjoining one, and closed the door. "He thinks I am asleep," thought Louisa, "and he will not disturb me. I will step to his door and bid him good night." She opened the door. Mrs. Hales was standing in the passage. "Do not," said she to Louisa, "stand in the cold, go back to your room, do."

This was said with an earnestness which led Louisa to suspect that her brother was ill. "I must see him before I sleep," said she, advancing to the door.

"Do go to your room, dear, and see him in the morning."

"He must be ill, or he would have looked in upon me, or would come out on hearing my voice. Brother!" rapping at his door.

There was no reply. She lifted the latch, and the brother stood before her, haggard and half unconscious of his condition, while the fumes of alcohol revealed the cause, and convinced Louisa of what no human testimony could have convinced her. She was supported to her room by her sympathising friend, who sat by her bedside till the gray of morning, making no attempt to hush her moanings. A furious storm then arose, and the snow and hail beat heavily against the windows, and tore the branches from the trees. The agitation of the elements was not greater than that which tore the soul of the guilty brother, now that the delirium was over, and the dread reality was fully revealed to his perception. He rose and went to his office. He did not appear at the breakfast table. An hour or two later, Louisa requested that he might be sent for. "Tell him," said she, "to come to me without delay, if he would not have me die." He came. There was no word or look of reproach. She took his hand and kissed it, and laid it upon her burning forehead, and closed her tearless eyes. He then could gaze upon her face. He saw traces of sorrow, such as carried agony to his soul. She soon became delirious, and the physician was called. His medicines failed to check the burning fever in her veins. Day after day, and night after night, Richard remained by her bedside, watching the rapid wearing away of life, and feeling that his conduct had been the cause. He was assisted by Mrs. Hales, whose heart was softened towards him, in consequence of the keenness of his anguish.

The crisis passed. The fever abated. Reason resumed her throne, but the extreme prostration of the patient gave but little hope that health would be restored. As she became able to converse in whispers, it was only to thank Richard for his kindness. One day when he had expressed a strong hope of her speedy recovery, she said, "My dear brother, you must not deceive yourself, I shall not be with you long."

Her slow and measured words seemed to carry conviction to his mind.

"And I shall ever have to reflect that I have been your murderer," said he, in a tone of bitter self-accusing.

"No, you are not to cherish such a thought. I have felt, for some time before this attack, that I should not live long. I never expect again to see the spring blossoms, or to hear the spring birds. I am not afraid to die. My chief, my only regret in leaving this world, is in leaving you alone, and," her lip quivered, "you know what I would say."

It was the first time she had alluded to the event of the night preceding her illness.

"If you and I were to live on earth a thousand years, the scenes of that night should never be repeated."

"Tell me—do not deceive your dying sister—was it the first and only fall?"

A terrible temptation is before thee, O young man! Yield not to it, even at the bidding of thy deep affection. Hold on to the truth, and there is hope for thee; yield, and the chain already thrown around thee shall be riveted.

With his eyes closed, for how could he look in hers and utter an untruth, he said, slowly, and as she thought, solemnly, "It was the first time; it was accidental, and yet I might have avoided it. I have been greatly to blame."

"Promise me; and remember the promise when I am lying in the grave, that you will never again suffer the cup to come near your lips."

"I promise."

Of what value was the promise from lips that could deceive so trusting a sister?

Time rolled on. The sun began to ascend higher in the heavens, the southern gales seemed to betoken the breath of spring, the fair girl still lingered with her friends. One day the air was so mild that the window was opened, and the breeze of heaven again stirred her locks.

'I should like to see another flower," said she, "I should like to be buried when the violets are fresh in the graveyard—but this is folly. I desire that our mother's God shall do with me as he sees fit. He will reward you for all your kindness to me. He only knows how kind, how very kind you have been to me."

'And He only knows how cruel I have been to you."

'Brother, I implore you never to make such a remark again. To-morrow, I will tell you how I wish you to dispose of my things, and what I wish you to do for yourself. I am exhausted now, I feel disposed to sleep."

Before he had closed the shutters, she was in a tranquil sleep, from which the fervent kiss impressed upon her forehead did not awaken her. He sat down before the fire. A strange sensation of fear oppressed him. He rose, from time to time, and went to the bedside. Louisa was in a deep, untroubled sleep. At length, sleep stole over him as he sat in his chair. It was disturbed by dreams of suffering inflicted on Louisa by his hand. A shriek, whether in reality, or in his dream, he knew not, awoke him. He rushed to her bedside, the deep sleep of repose had been followed by the deeper sleep of death. The breath had departed. The spirit had returned to God who gave it.

In the morning, Mrs. Hales found him sitting beside the cold form of Louisa. The conviction that he had murdered his sister, and that he was destined to be an outcast and a wanderer seemed fixed in his mind.

. . . . . .

The remains were borne to the church. Every one present except the solitary mourner was in tears. He sat gazing upon the pall, and did not change his position during the whole service. No tear fell from his eye as the coffin was lowered, and the sods fell upon it. Some who knew his kindness to her, were surprised, the observing saw that it was the tearless agony of despair.

He returned to his lodgings, and immediately commenced preparations for his departure. His attention was confined to articles belonging to himself. His hand was not laid upon a single article belonging to the departed one.

"Where are you going?" said Mrs. Hales, as she noticed his preparation.

"I know not. The mark of Cain is upon my brow."

"Do not leave me in my affliction," said she, weeping; for the loss of Louisa was to her as the loss of a daughter beloved.

"I cannot stay here. I have nothing more to live for."

"Live to do good."

'To do good to the indifferent and heartless, when I was false to her who was an angel, and loved me as man was never loved before! Do not hinder me. I must leave this place, or go mad."

Without bidding her farewell, he took his departure, very general surprise and regret were expressed by the inhabitants of the village. Subsequently, there were occasional rumours of a reckless course in the dissipation of London, but at length these ceased, and it was not known whether he was among the living or the dead.

Nearly a score of years had passed. Many of the elders of the village had been carried to their long home. Their children had come to manhood, and were bearing the burden and heat of the day.

It was a summer's evening, and a man whose clothing indicated poverty, and whose haggard features told of scenes of intemperance and vice, entered the village inn. It was the once respected, beloved Richard Burnet. No one recognised him. He sat in a corner of the bar-room till, as the evening wore away, the inn-keeper advised him to pass along, as he had no accommo-

dations for such as he. He rose and went to the churchyard, and passed the night upon the turf that covered the ashes of his sister.

The next evening he stood in the street opposite the house Mrs Hales. He was gazing upwards at the windows of the chamber from which, nearly twenty years before, the beautiful and pure had been carried forth to return no more. He was recognised by Mrs. Hales, who still lived, enjoying a cheerful old age through the supporting influences of a Christian hope. She urged him to enter, he did so. To inquiries respecting himself, he gave no replies. He would listen while she spoke of his sister. Right skilfully did she appeal to his seared conscience through the love which still dwelt in his heart for the memory of Louisa. But there was no working of the countenance, no indication of feeling, unless it were that of dark despair. Suddenly rising, he said, "It is of no use, my heart will never be changed." Without any act of courtesy, he left the house, and passed on, as if about to leave the village. As he was passing a house in the outskirts of the village, the sound of music fell on his ear, and arrested his progress. He stood before the open window, while a young lady played and sung a song that his sister used often to sing to him when their mother was with them, and when nought but pure affections and high purposes had a place in his bosom. He leaned on his staff, and the tears ran down his cheeks. The music ceased, and the young lady came to the window. "Sing that again, if you would save a soul," said he. The young lady complied with the strange request. When the last note had struck his ear, he turned and walked hastily to Mrs Hales. She met him at the door, his eyes were still wet with tears. "I have come," said he, "to ask leave to go to her chamber, to pray there."

Without speaking, she led the way to the chamber, and took from a drawer Louisa's Bible. "This was *her* Bible. That mark is just as she left it. That was the last place she read."

With a trembling hand he took the volume, and opened it at the place indicated by the mark. A passage on the page was marked by a pencil. With difficulty he read, "I say unto you that likewise joy shall be in heaven over one sinner that repenteth." He was left alone in that chamber. He kneeled down, and prayed earnestly for the gift of repentance and for mercy. Many days were spent in that chamber in the reading of her Bible, in weeping, and in prayer. Fearful was the soul-struggle that was going on there. For a long time the issue was doubtful. Sometimes it seemed that the waves of despair must overwhelm him, but one day he came forth from that chamber with a smile upon his countenance. The change of appearance was scarcely less marked than that of the former dweller amid the tombs, when he was seen sitting at the feet of Jesus, clothed, and in his right mind.

He supplied the place of a son to the aged widow, and was the prop of her few remaining years. A life of uniform rectitude showed the thoroughness of the change in his moral character, and gave impressive weight to his oft-repeated warnings to the young, of the danger of suffering the claims of any affection, however pure, to interfere with the higher claims of conscience and the word of God.

THE GRATEFUL NEGRO.

Although not a day of our lives passes over that we have not many opportunities of proving our affection for those who are dear to us, by little acts of kindness, forbearance, and consideration, it is not often that we are called upon to give our friends such a painful testimony of our love as that referred to in the declaration of our Saviour, when he says, "Greater love hath no man than this—that a man lay down his life for his friend." But none of us now can tell what the future will bring forth, or what we may be called upon to do; and the following very striking instance of grateful attachment is a teaching instance of how unexpectedly we may at any moment be placed in circumstances which will fully test the sincerity and disinterestedness of our affection:—

The father of the late revered stipendiary magistrate of Liverpool became second mate on board a merchant-vessel bound for the West Indies when he was only seventeen years of age, and on one occasion, the ship being anchored at some miles' distance from Jamaica, he was sent in a small boat to execute some small commission on the island. The little skiff was still three miles from shore, when she suddenly turned over, and six people immediately found themselves struggling for life in the deep, rough waves, one of these persons being a negro called Quamina, to whom the second-mate had shown great kindness, and had taught to read. Both, unknown to each other, strove to reach a cask of fresh water, hoping it would enable them to keep themselves from sinking until another boat from the ship should put off to their assistance. Quamina was the first to reach it, but he had only just laid hold of it when he perceived that the second-mate was nearly exhausted; and seeing that he must perish before the boat could arrive, he pushed the little cask, too small to sustain more than one, within his friend's grasp, and, hastily bidding his benefactor farewell, the negro relinquished his own hold, and perished in the deep waters.

Our admiration is excited for both parties in this true incident; for the young second-mate, who conceived a disinterested friendship for the negro, had so unostentatiously given up his leisure-hours to bestow on him the valuable gift of knowledge; and still more for Quamina, whose love and gratitude, when he was thus placed all at once in circumstances alike overwhelming and distracting, forgot himself, and generously sacrificed his own life to save that of his kind friend.

GOOD TEMPER.

BY CHARLES SWAIN.

There's not a cheaper thing on earth,
Nor yet one half so dear;
'Tis worth more than distinguish'd birth,
Or thousands gained a year.
It lends the day a new delight—
'Tis virtue's firmest shield;
And adds more beauty to the night
Than all the stars may yield.

It maketh poverty content;
To sorrow whispers peace;
It is a gift from heaven sent
For mortals to increase.
It meets you with a smile at morn—
It lulls you to repose;
A flower for peer and peasant born—
An everlasting rose.

A charm to banish grief away—
To snatch the brow from care;
Turns tears to smiles, makes dulness gay—
Spreads gladness everywhere;
And yet 'tis cheap as summer-dew,
That gems the lily's breast;
A talisman for love, as true
As ever man possessed.

As smiles the rainbow through the cloud,
When threat'ning storm begins—
As music 'mid the tempest loud,
That still its sweet way wins.
As springs an arch across the tide,
Where waves conflicting foam—
So comes this seraph to our side,
This angel of our home.

What may this wondrous spirit be,
With power unheard before—
This charm, this bright divinity?—
Good temper—nothing more!
Good temper! 'tis the choicest gift
That woman homeward brings,
And can the poorest peasant lift
To bliss unknown to kings.

ST. GILES'.

THE sketches we have already given, and others which we may give, are not intended to be comic. It is no part of the writer's purpose to attempt to be funny, for what fun can there be in poverty and crime? If any expect slang, and highly-coloured pictures of low life, they will look in vain for them in these pages. A wise gladness and philosophic merriment will be all that is attempted; and if we succeed in directing attention to the poor of London—often more industrious and

THE PROFESSIONAL BEGGAR OF ST. GILLS'.

worthy as a class than we care to give them credit for—a step in advance will have been taken, which others, with better means than we, may do well to improve.

Politest of readers, were you ever in St. Giles'? Didst ever, in idle mood, turn from the great thoroughfare of Oxford-street, and lose yourself in the mazes of Seven Dials? If a lady, of course, you will say "Impossible;" but if a gentleman—now don't deny it—and a resident in London, or even a visitor for a few week, you will equally, as a matter of course, have strolled into that miserable quarter lying midway between London proper and the West-end. For our present purpose it will be sufficient, however, to assume that you have merely a traditionary knowledge of this famous, or infamous—just according to the sense in which you use the words—locality. To St. Giles', then, having provided ourself with a thick pair of boots, and thrown a mackintosh cape over our arm—for it is always muddy, and very often rains there—and being, moreover, accompanied by a respectable individual who has taken office under the Metropolitan Police Commissioners, and does duty in various styles of costume—we wend our way through Drury-lane, reeking of bad fish, worse fruit, old clothes, foul gutters, barbers' shops, and a questionable populace. Out into Broad-street—a wide, dirty, rambling, and neglected thoroughfare between Holborn and Tottenham-court-road—and leaving New Oxford-street to the right, we pause opposite the church of St. Giles'-in-the-Fields.

Before we enter the purlieus of the quarter traditionally said to be the favourite of the poor Irish in London, and now somewhat shorn of its foul proportions, consequent on improve-

ments in the neighbourhood, let us look around. Rising high up into the murky sky, the spire of the famous church, rebuilt by Henry Flitcroft in 1784, attracts our attention. In the yard around it, covered now with the rank luxurious vegetation which seems to thrive in foul air, or in equally foul vaults beneath the edifice, were buried—Richard Penderell, famous in history as the preserver of Charles the Second, after the battle of Worcester, and for which service his descendants still receive a pension from the country; (!) the witty Sir Roger L'Estrange (died 1704); the celebrated Lord Herbert of Cherbury; the dramatic poet Shirley, who died in 1804. The church itself was originally the chapel of the Hospital for Lepers, founded by Matilda, queen of Henry the First, in the year 1101. It was erected into a parish church by Henry the Eighth, after the dissolution of religious houses; and at the north wall was the place of public execution. Here suffered Sir John Oldcastle, Lord Cobham, in the reign of Henry the Fifth, and Babington with his accomplices, in the time of Elizabeth.

But enough of the past. The novels and poems of the last and preceding centuries are as full of allusions to the infamous history of St. Giles' as are the works of the Jack Sheppard

THE BEGGAR FAMILY OF WHITECHAPEL.

the year of the Great Fire, Andrew Marvell, who died in 1678; and the infamous Countess of Shrewsbury, who "held the house of Villiers, Duke of Buckingham, while he killed her husband in a duel."

St. Giles'-in-the-Fields—the old church was literally "in the fields"—bears the bad reputation, in spite of its stocks and its pound, its cage and its roundhouse, its whipping-post and its gallows—all of which pleasant appliances it boasted of possessing till the beginning of the present century—of having been twice robbed of its communion-plate, once in 1675, and lastly

class of modern writers. Here dwelt the vicious Jonathan Wild. It was in St. Giles' that the scene of the immortal "Monsieur Tonson" was laid, and in Bowl-yard, "over against Dyot-street," the criminals took their last draught on their way to the "triple tree" of Tyburn. It is with the present of St. Giles' we have to do.

Whether it be owing to the influence of association, the dilapidated look of the houses, or the miserable appearance of the people one sees in some neighbourhoods in London, it certainly seems as if vice and foul weather were intimately

associated. This fact particularly strikes you in St. Giles'. A gloom appears to hang about the streets; an unhealthy odour is exhaled from the doorways; the gutters reek with filth; and a terrible look of discontent and wretchedness seems settled on the faces of its unwashed population. Poverty leers out of its numerous gin-palaces, and crime loans unabashed against its street-posts. Vice receives its first lessons in its mother's arms, and profligacy peeps from under brows not yet in teens. The thief and the receiver pass each other openly in the broad day, and nod familiarly to the policeman at the corner. It must be understood that in London and elsewhere a most perfect acquaintance exists between the protectors and the breakers of the law. It is only when a crime has been committed that the latter are in jeopardy; till then they are as free on the Queen's highway as you and I. Most charitable of readers, would you have it othe.

There is character in St. Giles'- peculiarity in the houses which line its streets, and distinguishing marks in the several ranks of its people. Cast your eye along the dusky pave. The majority of the doors, darkened every now and then by passers to and fro, lead to gin-shops—not taverns, but literally gin-shops, where the whole business is carried on for ready money, and the customers stand, one and all, to drink before the bar. And, that there should be no impediment in the way of the drunkard or the thief, you will notice that in the miserable shops which line the way are bought and sold every conceivable article of ornament, apparel, and household use. Nothing is too rich, and nothing too mean, for the dealers in stolen goods. In St Giles' a market equally exists for the gold-watch picked from the pocket of a lord, and the tattered rags gathered from the dunghill and the sewer. Even the food sold here partakes of the squalid character of the pl and viands, the very sight of which makes the stomach of the visitor heave with disgust, are certain of finding customers in the grimy courts and alleys of St Giles'.

The St. Giles' of daylight diff ally, however, from the St. Giles' of the night season as does light from darkness. By day, it is simply a miserably low neighbourhood, abounding in old clothes' shops, marine stores, "dolly shops," bird catchers, ballad-sellers, street-stalls, low public-houses, rags, filth, and squalid poverty; but by night who shall describe it? Many have ventured to give on its outer features; but no one man, except he be of the fraternity to which our friend of the "detective force" belongs, has ever ventured to sound the depths of its horrible iniquities, has ever dared to explore the inner life of its night-cellars, where sham cripples, begging-letter impostors, ballad-singers, vagrants, and lost women, congregate in unholy revelry, or sat in its thieves'-kitchens, where youths are elaborately educated in crime. It, as the poet says,

> "Vice is a monster of such frightful mien,
> That to be hated needs but to be seen,"

one would think a single night in St Giles' would save the intending felon; but it is to be feared that the context of that famous quotation is too often the consequence of a close inspection of the villanous orgies of St Giles', and that many "embrace" the filthy siren without even the initiatory processes of "endurance" and "pity."

It must be understood, however, that we speak here only of the "back settlements" of St. Giles', for this parish, like others, contains its goodly houses for the well-to-do and the industrious, and numbers at least half-a-dozen lords among its

But the
streets, know nothing, and care somewhat less, about the inhabitants and the doings of Seven Dials.

St. Giles' and Whitechapel—and what we have said of the character of the first will apply in many respects to the last—are the great rendezvous of professional beggars—people who would rather beg than work. Here, in dim cellars, where filth and darkness are next kin, are congregated whole hordes of such characters as the artist has depicted. Men without honour, women without virtue, children in whose little faces shine the premature cunning that grows out of such associations. Can it be that that wretched woman, tattered and worn and furrowed with sin, ever gambolled in green fields in her innocent girlhood? Oh, no! we shame humanity by thinking it. Look at her side for the portrait of what she was. They are types of e. other—lost in youth, hardened and callous in womanho depraved and miserable in age. People like these ne knew the comfort of a home, or, if they did, have long outli the memory of it. The life of such women is told in a few s tences—is written in the pictures the artist has drawn. either of the groups sketched by the graphic pencil of artist there may be read the story of a life—poverty, decepti immorality, disease, callous wretchedness. Who would c to inquire further? Who dares lift the veil, and expose inmost thoughts and habits of such as these? Not one of —that's certain. And yet why should we shrink back fi the performance of so obvious a duty as the raising up help for these lost, degraded beings? It is a duty, ignore it as will. How many of us dare look this evil in the face—d follow the wanderers home—dare trace the polluted stream

Can it be that the fair denizen of St. Ja
feel the slightest interest in the welfare, or the ill-fate, of l miserable sister of St. Giles'. Senators are silent as to t occupations and condition of the very lowest grades of t people, and it is only when some popular author, who l purposely made himself acquainted with the facts, introdu his reader to the population of St Giles', or Jacob's Isla that the world of well-to-do folk can be brought to believe lives in the very midst of so foul a pestilence. Then for a li while—just while the novel is fresh, and the newspapers m extracts—its polite readers are anxious to learn somethi of this pauper population, which gets its living
know how, and is quite unacquainted with the inside of workhouse. Inquiries are made of visiting clergymen a
manies; blue-books are searched fo
nd penny-a-liners suddenly bec
portant in virtue of their knowledge of low life, and schr are set on foot and societies are formed, with lords and M.I for committee-men, for the "amelioration of the conditio the poor," the building of school-houses, and the free distri tion of Bibles. But before the second edition of the novel announced the fervour has subsided, young ladies begin feel rather disgusted with the sickly details they were at fi so eager to listen to; gentlemen vote the statistics a bore; t prospectuses of the societies lie undistributed at the printer who ultimately uses them as waste-paper to pack parcels a and the miserable victims of vice and want are left much they were before—to themselves, with no sympathisers b the poor priest and the scripture-reader.

Do we who call ourselves "society"—we who are cognisa of the fact, that these denizens of the lowest haunts of Sout ark, Whitechapel, and St. Giles', are bringing babes in the world only to be initiated into vices like their own—be no part in the moral evil? Do we, who look calmly on an yet take no steps to stop the moral contagion and prevent t onward flow of that deadly stream—do we, too, not sha the shame? Oh, proud of heart, and noble of lineage, w clothe yourselves in fine linen and fare sumptuously eve day, look on this picture, and shudder at the results! But yo care not for the vicious—why should you? Wrap yourselv in the apathy of your wealth, and wake not from the dream your high station till fever, bred in the squalid, overcrowde courts and cellars of St. Giles'—fever bred of filthy dwellin, and uncared-for people—swoops down upon the costly couch of St. James'! And you, oh, clever legislators and improve of the city-ways! think for a moment, that for every haunt crime uprooted to make room for splendid dwelling-plac
open streets, the teeming cellars of poverty a... ...
filled the fuller! In a great city crime and poverty are inevi able. For the unsteady of purpose and the weak in principl temptation lurks in every street, and vice puts on her mo attractive garb. But should the number of the vicious excu the apathy of the good? No! Should the degree of shan prevent inquiry? No! Should the stolid ignorance of th crowd make feeble and of no avail the voice of ed cation? No! Should the unthankfulness of the mor leper prevent our pouring the balm of pity and assistanc into his wounds? No! Should the worse than indifferenc of the unbelieving close the hand and still the voice charity and religion? Emphatically, No! We have grow
... It is a serious subject, and we shall crowhile sum it.

JOHNSON JEX.—A STUDY FOR THE MILLION.

LATELY, at Letheringsett, near Norwich, died a learned blacksmith, worthy of something more than provincial fame. Altogether this man, whose name was Jex, seems to have been an extraordinary character. A short account of his life and of his mechanical inventions will doubtless interest our readers, for *he* did not belong to the "crowd of those who are faithfully stamped like bank-notes, with the same marks, with the difference only of being worth more guineas or fewer." A single sentence may serve to give a comprehensive description of this remarkable man—he was pre-eminently "an original thinker." He took nothing for granted, but reasoned deeply upon every subject that presented itself for his consideration.

Johnson Jex was the son of William Jex, a blacksmith, and was born at Billingford, in this county, in or about the year 1788. In his boyhood he was sent to a day-school, but he has often been heard to say that although he was *sent* off to school for years, he never *went* three months in his life. He frequently walked to Foulsham instead, to look in at the shop window of Mr Mayes, a watchmaker, who resided there He did not even learn to read or write at school, but taught himself afterwards. His mechanical talent manifested itself at a very early age When about five years old he was left alone in a at his grandmother's, at Cley-next-the-Sea, and employed his time in taking a lock off a drawer with an old knife, "to see what was in it."

With regard to Jex's first experiment in clock-work, the following anecdote is related. When about twelve or thirteen years of age, a watchmaker went to his mother's house to clean her clock. Jex watched him while he took it in pieces, cleaned the works, and put them together again. No sooner had he left, than the boy determined to try whether he could not do the same. He at once went to work, and completed his task with all the skill and exactitude of an experienced hand. (He had not mention this circumstance till several years afterwards.) From that time he began to turn his attention to watch and lock making, and, *without having served an apprenticeship* naturally attained great excellence in the art. When about thirteen years old he became acquainted with Mr Mayes, of whom mention has already been made. Mr. Mayes' attention was first attracted towards Jex by frequently observing him look in at his window. He at length asked him what he wanted. Jex replied, "he wished to see *that thing*"—pointing to a newly-invented instrument for cutting clock wheels. Mr Mayes showed it him, but did not allow him to touch it. Jex declared he "could make one like it," and accordingly did so in about a month. Mr. Mayes was delighted with the talent and ingenuity displayed by the boy, and from that time took great pleasure in showing him anything connected with his business At his death he left Jex a legacy of £50, as a proof of the high esteem he entertained for him.

In early life Jex was by no means robust in health, and he afterwards declared his belief that working at the bout hammer, at the blacksmith's anvil, had been the means of strengthening his constitution and saving his life. Some particulars of Jex's early history are given in Young's "General View of the Agriculture of the County of Norfolk." We subjoin the following extract, written about the year 1802. "Under the head Implements, I must not conclude without mentioning a person of most extraordinary mechanical talents, Mr. Jex, a young blacksmith, at Billingford, at 16 years of age, having heard that there was such a machine as a waymeasurer, he reflected by what machinery the result could be produced, and set to work to contrive one; the whole was his own invention. It was done, as might be expected, in a roundabout way, a motion too accelerated, corrected by additional wheels, but throughout the complicity such accurate calculations were the basis of his work, that when finished and tried it was perfectly correct without alteration. His inventive talents are unquestionable. He has made a machine for cutting watch pinions, a depthening tool, a machine for cutting and finishing watch-wheel teeth, of his own invention, a clock-barrel and fusee engine, made without ever seeing anything of the kind. He made a clock, the teeth of the wheels cut with a hack saw, and the balance with a half-round file. He has made an electrical machine, and a powerful horse-shoe magnet. Upon being shown by Mr. Munnings a common barrow-dull, the delivery by a notched cylinder, he invented and wrought an absolute new delivery; a brass cylinder, with holes, having moveable plugs governed by springs which clean the holes or cups, throwing out the seed of any size with great accuracy; and not liking the application of the springs on the outside of the cylinder, reversed the whole, and in a second, now making, placed them most ingeniously within it. He has not yet failed in anything he has undertaken; he makes everything himself—he models and casts them in iron and brass, having a powerful wind-furnace of his own invention. It is melancholy to see such a genius employed in all the work of a common blacksmith. However, he is only 23 years of age, and I am mistaken greatly if he does not ere long move in a much higher sphere. This is not a country in which such talents can long be buried; a mind so occupied has had no time for vicious habits; he is a very sober, honest young man, and bears an excellent character."

Unhappily for the interests of science, the talents which excited admiration at so early an age, and which expanded with the growth of years, were destined to remain for ever buried in obscurity. Shortly after Young's notice of him was written, Jex removed to Letheringsett, near Holt, where he worked as a common blacksmith till within the last thirty years. Since that time he has employed workmen in the practical part of his business, but he continued till his decease to live in the house adjoining the blacksmith's shop. His mother, to whom he was devotedly attached, was his companion until her death, which took place about twenty years ago. Since then Jex has led a life of complete solitude—*a scientific anchorite*. No monk, bound by the vows of his order, ever devoted himself more completely to the service of his church than did Jonathan Jex to the pursuit of science For this he "lived, moved, and had his being" His thirst for knowledge of every kind was so great that no obstacles in the way of its attainment appeared insurmountable. His natural taste for mechanics led him to the greater part of his time to this branch of and some of his inventions were evidences of a splendid intellect conjoined with the power of severe and continuous application.

The first watch ever constructed by Jex was made after he had settled at Letheringsett, for his friend the Rev. T. Munnings, of Gorget, near Dereham. *Every part of this watch, including the silver face, and every tool employed in its construction, were of Jex's own making.* At Mr. Munning's request he engraved inside the watch these lines —

> "I, Johnson Jex, a blacksmith bred,
> With some strange crankums in my head,
> And tools on which I could depend,
> By me invented for a friend
> This time-piece made from end to end.
> If this your mind should still perplex,
> Behold my name—'tis Johnson Jex"

This watch was stolen by housebreakers, and the particular escapement adopted by Jex in its construction cannot now be ascertained It is believed, however, to have resembled that known to watchmakers as the "*horizontal escapement*," as he actually made a "ruby cylinder" for this watch. This fact was mentioned to Arnold and Earnshaw, two celebrated London watchmakers. The former declared that a ruby cylinder could not be made out of the metropolis, and that only two or three Italians in London could make such a thing. Mr. Earnshaw said it might be *possible* to have a ruby cylinder made in the country, but it was not probable, and he expressed a great wish to see the "Village Blacksmith" who had achieved such a triumph of skill, offering at the same time to show him all possible attention It was through the advice of Mr. Munnings that Jex once exhibited some agricultural implement of his own invention at the Holkham Sheep Shearing. Owing, however, either to its complicated structure or to some personal pique between Mr. Munnings and Mr Coke, its value was not appreciated. This so disgusted Jex that he declared he would never again bring his inventions before the public, and to this resolution he firmly adhered.

One of the greatest efforts of Jex's inventive powers was the construction of a gold chronometer, with what is technically termed a "*detached escapement*" and compensating balance, which was made long before he ever saw or heard of the "*de-*

'ached escapement—the principle of which has since been so successfully applied by Arnold and Earnshaw. Jex turned he jewels himself, made the cases, the chain, the mainspring, nd indeed every part of the watch except the dial. The very nstruments with which he executed this wonderful piece of nechanism were of his own workmanship. It is only by watchnakers themselves that this triumph of skill can be adequately ppreciated. *They* know that no single man is ever employed o make a complete chronometer, but that different parts of the nechanism are entrusted to different hands, and that many are mployed upon a single watch. Several watchmakers refused o give credence to the statement when first told them, that ohnson Jex, a blacksmith, had made a chronometer by his own nassisted skill—more especially when informed that he had isdained to tread the beaten path, a servile imitator, but had plied an entirely new principle in its mechanism. The late Ir. Cozens, of London (whose name is familiar to most watchnakers), actually furnished Jex with the gold in its rough state, rom which he manufactured the chronometer. It was made or the late Sir Jacob Astley. By a curious coincidence it fterwards fell into Mr. Cozens' hands, and was purchased as curiosity by Mr. Blakely, of Norwich, in whose possession it till remains. Inside the case are engraved the words, "An riginal invention, by Johnson Jex." This chronometer was xhibited a few years ago at the Norwich Polytechnic.

Such was Jex's thirst for information, and such was his reolution to clear away every obstacle which impeded his proress, that, wishing to read some French works on Horology, e mastered, *unassisted*, the French language, when about 60 ears of age! He then read the books in question, but found hat they contained nothing that was new to him, he having ecome thoroughly acquainted with the subject by previous tudy of English authors.

Another of Jex's inventions was a LATHE of extraordinary ower and ingenuity, which remained in his possession until is death. By means of this lathe he was enabled to cut the eeth of wheels mathematically correct into any number, even r odd, up to 2,000, by means of a dividing plate. He also conructed a lathe on a minute scale for turning diamonds, which s very complicated in its structure. He likewise invented an ir-tight furnace door for his own greenhouse, so admirably onstructed that the fire would keep lighted from Saturday ight till Monday morning, thus obviating the necessity of his ttending to it on the Sunday.

About ten years ago he invented a method of opening greenouse windows for Mr. Cozens Hardy, by which means they an be set open at any required width, and so fastened that the ind has no power over them. The contrivance is *extremely imple*, and yet so effective that it deserves a patent, and ought o be *universally adopted*.

In addition to being a watchmaker, Jex was also an iron and rass founder, a glass blower, a maker of mathematical instruments, barometers, thermometers, gun barrels, air guns, &c. The latter he considered extremely unsafe, one of them having urst in his hand, after having been submitted to a severe roof. Jex understood electricity, galvanism, electro-magnetism, &c., and had a thorough knowledge of chemistry as far as he metals are concerned. He had in his workshop an electrical machine, which he once employed in a ludicrous way. He had been very much annoyed by a dog which kept contantly paying him visits, and was decidedly "more free than welcome." Jex resolved to cure the dog of its propensity, nd accordingly charged his machine, and then baited the ire attached to it with a piece of meat When next the dog ppeared it eagerly seized the dainty morsel, but a severe hock in its nose so terrified the poor animal that it instantly ook to its heels, and from that time forth was never seen in ex's yard.

Amongst other sciences, Jex understood astronomy, and ould calculate the time by the fixed stars. In taking astroomical observations, he was accustomed to make use of his wn door-posts and a chimney opposite. His knowledge of stronomy, *as of everything else*, was SELF-ACQUIRED.

He made telescopes and *metallic reflectors*, which are universally acknowledged to be extremely difficult of construction. He puzzled his brains for some time on the question of "perpetual motion," but at length gave it up as unattainable.

We feel ourselves utterly incapable of doing justice to Jex as a man of science. It is probable that comparatively few his successful experiments were ever made known to any ot person; consequently many of his most important inventi have doubtless died with their author. It is melancholy reflect upon such a waste of talent. He was often urged a more suitable field for the exercise of his powers, but co never be induced to leave the secluded village in which he h fixed his home. He never visited London; and it is even heved that he was never out of the county which gave l birth. He had a great dislike to travelling, and never r a railway tram, although he lived within twelve miles o station.

Some sixty years ago, when he was a mere boy, Jex fi heard steam spoken of as a motive power of irresistible for The boy thought its power was over-estimated, and resolvec test it by a most original experiment. He first partially fil a gun barrel with water, which he stopped up with a stro plug. He then put the barrel into the blacksmith's forge, r in process of time steam was generated, and the plug of cou forced out. Jex needed no further experiment to prove power of steam. He was a first-rate arithmetician, and co work very complicated calculations. His reasoning pow were of the finest order, nevertheless, paradoxical as it n appear, he was in some things extremely superstitious. I instance, he would never *begin* anything on a Saturday, and used to say that therein he followed his mother's example. was naturally a timid man, and excessively afraid of contagi yet he lived in a state of filth which was almost sufficient itself to generate disease. He never allowed a woman to en his house for the sake of cleaning it, and his rooms consequen contained the accumulated dust of years. His disposition v shy and retiring, but whenever he met with any one wh tastes were similar to his own, he would converse for ho with the greatest delight upon any subject connected with t arts and sciences. He was a man of the strictest integrity, r of unimpeachable veracity. He was *entirely* destitute of love of money, and sought out truth *for its own sake*, and w no view to any personal gain. Such an example is rare indc in this grasping and selfish age. He was kind in his manı to the poor, and rarely sent a mendicant away without reli He was naturally very humane, and of which the following one proof. He used to keep bees, but could not endure t idea of being obliged to burn them in order to get the hon He therefore invented a new kind of beehive, which entirely p vented the necessity of perpetrating what he considered to an act of cruelty.

As a proof of the sterling uprightness of Jex's dealings, must mention a highly characteristic incident. He was fc of music, and meeting with a second-hand barrel organ, pi chased it for £6. When he got it home he fancied the pr he had given was below its real value, and he therefore se the person of whom he had bought it £2 additional. This m be thought by some too trivial a circumstance to be record here, but it will not by those who remember that very " tensive prospects may be seen through small openings." T character of J. Jex is one in which the moral philosopl may find ample scope for the exercise of his analytical powc He was a "man of mark," whose giant intellect burst the b riers of opposing circumstances, and forced for itself a w into light and liberty. He reminds us forcibly of Bur familiar lines—

> "The *rank* is but the guinea's stamp,
> The *man's* the gowd for a' that."

Jex's personal appearance was prepossessing. He was abc the average height, and well proportioned. He had a pleasi expression of countenance, and when engaged in conversatic a very animated one. His eye was bright and intelligent, a he had a *remarkably* fine head, a cast of which has been tak by Bianchi, a Norwich artist.

Johnson Jex was addicted to no vice whatever, but thou strictly moral in all his actions, we fear he was not goverr by the higher principles of religion. On this subject, howev it behoves us to be silent, remembering that his immo spirit is in the hands of that Being who can alone discover t secret springs of action in that most wonderful of all mechr isms—*the human heart*.

Jex was hardly ever known to attend public worship. T

last sermon he heard was one preached many years ago, at Cromer, by the Rev. W. Brock, with whom he was personally acquainted. He listened with marked attention, and afterwards expressed himself highly delighted with the sermon.

In 1845, Jex had a stroke of paralysis, from the effects of which he never entirely recovered. His intellect gradually lost much of its original power, and the last year or two especially, a very marked alteration was perceptible. He was again attacked with paralysis in November last, and his death took place on the 5th of last month. His remains are interred in Letheringsett churchyard.

Thus lived and thus died Johnson Jex, whose history forcibly exemplifies the truth of Gray's lines—

"Full many a gem of purest ray serene,
The dark unfathom'd caves of ocean bear;
Full many a flower is born to blush unseen,
And waste its sweetness on the desert air."

THE WORKMEN OF EUROPE.

M. Blanqui, the great French political economist, in an article on the Exhibition, expressed his regret that we had not an exhibition of workmen as well as of manufactures last year. The idea is a very good one—but unfortunately now it is an after thought. The time has gone by for its realisation. We can now have only a mental review of the workmen, whose wonders a whole world came to see. M. Blanqui attempts something of the kind. We abridge his sketch for the edification of our readers. He begins with the Englishman. The English workman, he says, is a being apart; having his manners, his habits, his vices, his virtues, his pride, his modes of working, and his amusements, peculiar to himself. His mirth and his gloom resemble no other. The miners, the spinners, the weavers, the builders, the stokers, all the workmen engaged in manufacture, have almost nothing in common with those employed in agriculture. The workmen engaged in manufacture all evidently identify themselves with the regularity of their ...chines, under the influence, I had almost said despotism, of the division of labour. They are compelled to go and to come, forward, and backward, like the machines *which employ them*, the machine commands and they obey. Their task is regulated with mathematical precision, and their arms make as many movements as the brake-wheels make revolutions. After some time the result is a species of automatic life, a frightful monotony, from which the workman only escapes in his leisure moments by strong and gross excitements, by intemperance, which leads to drunkenness, and this drunkenness itself is of a gloomy and savage nature.

The manufacturing system has likewise profoundly modified the character of the English workman. He lives less in the midst of his family, and belongs much more to his fellow-workmen than to his children. His existence has ceased to be domestic. From the commencement he enrolled in one of the thousands of societies which abound throughout the country, and which, if need be, easily assume the attitude of coalition. The workman's forum is the meeting-place of his trades' union; it is the club of which he forms part, the economic and industrial association to which he is affiliated. These associations are reckoned in England by thousands, they form veritable tribes, which have their regulations, their prejudices, their exigencies—nay, even their superstitions. The spinners and the printers of Manchester, the hosiers of Nottingham, the cutlers of Sheffield, the smiths of Wolverhampton, the potters of Burslem, the colliers of Newcastle, the ribbon weavers of Coventry, the cloth weavers of Leeds, form as many industrial armies, obeying the voice of their chiefs, each ranged under his own banner, and in reality distinguished by a kind of peculiar physiognomy easily recognisable.

The wives and children of these workmen generally follow the vocation of their husbands and fathers. They thus get inured to them at an early age, at least in those branches of industry which admit of the employment of women and children, and they at last acquire faults and physical and moral qualities which are really characteristic. Their costume never varies; a spinner, a mender, a collier, a smith, are always nearly dressed in the same manner, and even their hair, particularly amongst the women, is arranged according to their vocation with invariable regularity. Their minds, incessantly bent upon the same object, eventually acquire a gift of second sight, which often, without instruction, leads them to discover improvements of important details. It is seldom, however, that their thoughts travel beyond the regions of the factory and of material enjoyments, and it is a distinctive trait in their character, that none of them dream of making their fortune as politicians, neither does ambition penetrate their souls. They like labour for its own sake, and it is a great point of self-love with them to devote themselves to it conscientiously and perseveringly. There is a great deal of affinity between them and their machines. They have little initiative, of taste and ideas, and they are infinitely less artistical than ours.

The French workman is nearly in every respect the opposite of the English one. His dependance, proud and haughty, always resembles a concession, and he deems himself attached to a temporary yoke rather than to a permanent workshop. His exactness and his stability nowise partake of the English fatality and resignation; he would be ever ready to go, and to give notice, rather than to receive it. He is more gay, more lively, more talkative, more of a reasoner; and, since the contagion of politics has entered our manufactories, he has become imperious, cavilling, *important*, and rather occupies himself with the government of the state than that of his looms. Among many, business is looked upon as an affair of circumstance and of necessity, they occupy themselves with it because it is necessary to live, and hitherto politics have not yet discovered the secret of supplying masses of men with a livelihood without labour, but their minds are, in reality, elsewhere, and in quest of perpetual and undeniable amelioration.

The real French workman is the workman of art, and it must be said, whatever may be their faults, such are the Parisian workmen. There are excellent workmen throughout France; there are only perfect ones in Paris. Our weavers of cloth and our spinners of cotton resemble, in many respects, the English workmen of their categories, but the Lyonnese workman, the designer of Mulhouse, the operative manufacturer of shawls, he who makes the ribbons of St Etienne, have always required to receive from Paris *the secret influence*, either by means of the design, or by the idea of the *order explained*, to reach perfection. Paris is like a large school of taste, which gives the tone and the colour. It is there, in fact, that are formed in innumerable schools of design, mostly gratuitous, these legions of ingrates, so intelligent and so able, who have acquired their talent in establishments maintained by governments which, every ten or fifteen years, they take so much pleasure in upsetting.

If you examine well, you will find in the provinces a host of remarkable special manufactures. Doubtless excellent guns are made at Chatellerault, and at St. Etienne, but it is in Paris alone that beautiful arms are made. Watchmaking is carried on very economically and very ingeniously in Franche-Comte; but it is in Paris that the finishing-stroke is put to these watches, and it is there only (I am only speaking of France) that they are worthy of their name. Good locks are unquestionably manufactured in Picardy, and which are not dear, but the great lockmakers—the masters of the art—are all in Paris. It is thence that all inspira-

The Chamber of Commerce of that city is now engaged in printing a book which will be exceedingly curious, and which will clearly explain this economic phenomenon; it is a faithful statement of all the professions exercised in that great city, street by street, and, to some degree, man by man; an analysed register of that ingenious, intrepid, and capricious ant-hill called the workpeople of Paris.

There will appear, for the first time complete, the nomenclature of these ancient branches of industry, whose products, known under the name of Parisian articles, are spread over the entire world, and which know no rivals. Nowhere is such furniture made; nowhere are toys, bronzes, paper-hangings, tapestry, articles of fashion, umbrellas, ornaments, and those thousands of trifles which represent millions in value, produced better than in Paris. This vast industrial encyclopædia comprises entire streets of the capital, the streets St. Denis and St. Martin, the street of the Faubourg St. Antoine, the street Geoffroy, the street Bourg l'Abbe, the two streets of the Temple, where more than one unknown genius produces master pieces at wretched prices, and frequently imparts value to nameless materials—to lucifer-matches, for instance, which absorb, it will hardly be believed, the whole timber-yards. But the greater part of these branches of industry are nearly entirely domestic, they are carried out, like the works of the milliners and lacemakers, in circumscribed workshops, in which the most skilful mechanical resources frequently

secure the independence of the workman, who is paid by the piece, and who manufactures articles for which he has received or furnished the raw material according to the extent of his small capital. It is this mode of labour, common to the Parisian and the Lyonnese workman, which imparts to both a peculiar physiognomy amongst all the races of French and foreign workmen London does not produce the immense variety of articles that are made at Paris. Mechanism governs everything, and individual labour does not strive to seize on that part of its domain in which all the marvels of our capital are produced, under the inspiration of the taste which distinguishes its artists. Sevres, the Gobelins, the Savonnerie, are the types of that brilliant school of decoration whose lustre has shone over the entire of French industry, to the eternal honour of those who have laid or strengthened their foundations.

The more I study the question of workmen employed in manufactures, the more I remain convinced that the true vocation of ours is to excel in those branches of industry which can do without protection, and live an independent life by inspiring themselves with the sacred fire of art. The English so thoroughly understand the French superiority in this respect, that for some time they have made unheard-of efforts to encourage, amongst the good workmen, the study of drawing, and the cultivation of the beautiful, so necessary to the useful. Wanting their own, they borrow our workmen, thus implicitly admitting that neither the progress of machinery nor the low price of freights, nor the abundance of capital, can compensate for the absence of taste, which is also a creator of value. Open the lists of the jury awards, and you will see how powerfully this peculiar French element of wealth has weighed in the balance; which has charmed the judges, after having excited the admiration of the entire world The works of the Lyonnese will probably remain the most brilliant souvenir of this memorable struggle

A third family of workmen has appeared with *eclat* on the great stage of the Universal Exhibition, these are the workmen of the German region, in which are comprised all those of Prussia, of Austria, and those of the other German states They are less known, and have hitherto made less noise, than the French and the English, because they are less agglomerated, less compact German manufacture, with the exception of that of some towns or valleys renowned for their industrial establishments, is, as it were, lost and drowned in the wave of rural populations, which are the predominating element of that portion of Europe. But the German workmen have just proved of what they are capable, and the world has beheld with admiration a host of products created by them, worthy to compete with those of the most advanced nations The Imperial Printing-office of Vienna has obtained a council medal, whilst the National Printing-office of Paris has only obtained the prize one. The Prussian founders have covered themselves with immortal glory. The Austrian cabinetmakers have appeared to me likely to become more redoubtable rivals to those of the Faubourg St. Antoine than those of any other country in the world.

Hitherto, however, these skilful men have only been imitators in everything. The German workman invents little, but he copies marvellously well—not servilely, but by imparting to his works peculiar stamp of *naivete* They are less mechanical than the English, and less artistical than the French; but they rather incline to the French style, wanting, however, their elegance, which they sometimes happily replace by the natural and the simple, when they do not degenerate into mannerism. Their habits are, generally, tolerably temperate The English eat, the Germans intemperately, by day, by night, I had almost said at meal-times, in bed—it is frightful; and if this habit would persist in developing itself, Germany would become uninhabitable One of my greatest apprehensions is to see the ruinous taste penetrate into our workshops, where it injures and stupefies the children, and causes amongst them more serious ravages than is generally believed The German workman likes much more in the midst of his family than the other workmen of Europe; and although the absurd spirit of communism is at this moment infecting the German world beyond all conception, the old fundamental qualities which distinguish it will struggle a long time against the tendencies of the evil genius which has been introduced, it must be admitted, into Germany by the students and the universities. The German workman is patient and thoughtful; he has much more sensibility than the English workman; much less elegance than the French one. He likes to infuse sentiment into his works; and I might mention works in Bohemian glass, toys of Nuremberg, porcelain of Saxony, even printed calicoes and clocks, which bear strong evidences of this tendency, which might be called pastoral, if it did not frequently degenerate into the trivial and vulgar.

On the whole they are a race of men now very much advanced. They have gradually profited by the discoveries and processes of France and England, and, after having, for a long time, made common woollen cloths in Silesia, they now manufacture very fine ones at Aix-la-Chapelle. The abolition of barriers between German states, consequent on the establishment of the Zollverein, has contributed, in no trifling degree, to give to German industry an impulse which has not ceased to grow under the influence of the habits of order and economy of its manufacturing population, and by the aid of the numerous hydraulic movers spread over the whole surface of the country Germany will not arrest its progress in so noble a path, and, notwithstanding the efforts which have been made to allure it to the beaten track of protection, it will complete its interior enfranchisement by the speedy conquest of freedom of commerce

The Spanish workmen do not deserve the fourth rank in the great working family of Europe, judging only from the actual importance of the products which they have sent to the Exhibition; the Belgian and the Swiss would have the right to take precedence. But Belgium and Switzerland gravitate in the orbits of France and Germany, and their workmen, nearly equally distributed between agriculture and manufactures, are not so original as those of Spain. Spanish workmen are, more than is generally imagined, choice men, remarkable for vigour as well as suppleness, and nearly all of proverbial sobriety I have been surprised on going through the manufactories of Catalonia, at the frugality of their habits, and their liveliness, and their admirable aptitude for labour. Their intelligence and activity are well calculated to surprise those who judge of Spain from the reputation of indolence and effeminacy enjoyed by its inhabitants. The Gallicians, the Basques, and the Asturians, are first-rate workmen; those of Andalusia not less so, and I have found in the province of Valencia, unjustly renowned for its idleness, workmen endowed with as great an energy and ingenuity as those engaged in our silk manufactures of Lyons and Avignon. The contagion of Socialism has not yet penetrated amongst these vigorous and poetic populations. They are, doubtless, much behindhand as regards education, and do not possess all the resources of machinery of the English workmen; neither are they endowed with the indefatigable and serious perseverance which characterise them; but they are eminently fitted for industrial pursuits, and the sacred light of ancient art which has shone in Spain is on the point of being rekindled amongst them The two last expositions of Madrid, although very incomplete, have raised the most legitimate hopes in this respect. The Spanish workman is in the path of progress, since the fall of the regime which favoured idleness and recklessness in this country, as soon as the greater portion of the convents were transformed into factories, other manners commenced to prevail, and I know robust monks who have become excellent spinners.

Spanish industry cannot fail to revive, in conditions compatible with the country, thanks to the peculiar facilities which the workman is assured of finding in the mildness of the climate, the abundance of raw materials, and, above all, the richness of its mineral products It will be long before Spain will have to dread the invasion of the doctrines which have perverted the moral sense of the other working populations of Europe. "The workman of that country," according to the expression of M. Ramon de la Sagra, "knows not yet to curse the hand that pays him; he accepts labour as a duty, never as a yoke; he obeys from conviction and from habit, and he preserves his pride and his integrity in the humblest station." Would I could say the same of the Italians; but there is no longer an Italy. Italy no longer belongs to herself, and does not know herself; and but for the vigour of Piedmont, which her recent misfortunes have not yet been able to cast down, and which carries in her bosom the destinies of the Peninsula, we should have to look to the past rather than glimpse at the future for the glory and prosperity of the Italian workman.

MISCELLANEA.

IRON VESSELS IN THE INDIAN SEAS.—An iron vessel, called the Three Bells, which has just arrived from Australia *via* Calcutta, furnishes a very satisfactory proof that the objection against the use of iron in the Indian Seas on account of the impossibility of preventing it from fouling can be effectually overcome. The Three Bells was coated with the protective paint which has lately been brought into use, and she has returned, it is said, without any barnacles and with less fouling than in any copper vessels coming off a voyage [illegible] This vessel was built at Dumbarton for the Australian trade, but her first trip was to the St. Lawrence, on which occasion she made the passage from Quebec to Glasgow in 15 days and 11 hours. She is 730 tons, old measurement, and her hold is divided into five water tight compartments. Her run from Calcutta was 111 days

SMOKING AND PARALYSIS.—A leading medical practitioner, at Brighton, has lately given a list of sixteen cases of paralysis, produced by smoking, which came under his own knowledge within the last six months. Then, the expense is ruinous. Many young men smoke eighteen cigars per diem, besides what they give to their friends. Not long ago, I heard an inveterate smoker, whose entire income could scarcely have amounted to three hundred a year, declare that his cigars alone cost him one hundred and fifty. He drew the long bow, of course, but if fifty was the truth, it was bad enough. A curious phase in the disease is the taste for short, dirty pipes, black with age, use, and abomination, which has crept in lately. Every third dandy you meet h[illegible] these in his cheek. The cutty and the cigar hold divided reign. Several speculators, during the last year, traversed Ireland, buying up sackloads of these indigenous productions, which they sold again in London at an enormous premium. The peculiar atom, so much coveted, is only to be met with in specimens of the *dhudeen*, which have passed through many months in successive generations, and have become family relics. Even in Boston, in the United States, in the land where, according to some naturalists, children are born with lighted [illegible] their mouths, there is a law against smoking in the streets, and penalties inflicted on the offender. With all our respect for our transatlantic brethren, and their matchless energies, we scarcely expected to have received from them such a le[illegible] offensive civilization. The remarks of Cob, the water carrier, on this subject, in Ben Jonson's play, two hundred and fifty years ago, are as applicable in 1851, as if they were written the day before yesterday.—"By God's me, I marvel what pleasure or felicity they have in taking this same filthy, roguish tobacco! It's good for nothing but to choke a man, and fill him full of smoke and embers. There were four died out of one house last week with taking of it, and two more the bell went for yesternight. One of them, they say, will never 'scape it. By the stocks, an' there were no wiser men than I, I'd have it be cut whipping, man or woman, that should but deal with a tobacco pipe! Why, it will stifle them all in the end, as many as use it. It's little better than satsbane or rosaker."

A CUMBERLAND DISH.—Two calf-feet after having been well cleaned, are boiled for two hours, and then potatoes in quarters are added, with onions, pepper, and salt, letting them boil the usual time. When this is poured into a large dish, it will make a dinner for four persons, and will cost only eightpence. What is left will make a cold jelly for supper.

INDIAN CAVE TEMPLES.—These cave temples bear a very striking resemblance, as regards internal form and arrangement, to our own old Norman churches, having, like them, the threefold division into nave and aisles, as also what answers to the apsidal termination. Over the nave is a waggon vault, the aisles being formed with a flat roof. In the most ancient of these viharas and chaityas, we find but little ornament and no idolatrous statues, whereas in the latter and, to us perhaps, the most interesting st[illegible] greater magnificence and artistic display, the walls and roofs being covered with frescoes, the pillars sculptured, and the interiors having a multitudinous array of statues, which, by the l[illegible] fined to images of Buddha himself, but represent his followers of both sexes. These [illegible]ale and female saints were regarded with about the same amount of [illegible] awe and foolish veneration as is accorded to the saints of some Christian calendars.

THE AVOCATIONS OF MR BARNUM.—It is impossible to repress a feeling of [illegible]nishment at the activity and speculative enterprise of Mr Barnum. The following are only a few of his employments.—He owns Iranistan, a sort of Moorish Palace, near Bridgeport, Connecticut, which cost about 150,000 dollars. There Mr B resides with his family, going down to New York by railroad in the [illegible]nd returning before dark. He owns the American Museum in New York, and "Barnum's Travelling Menagerie, [illegible]ne hundred and [illegible] He sent three ships [illegible] Indi[illegible] Ocean, to obtain wild animals. One was lost on her return. The next brought the [illegible]ag elephant & that co[illegible]poses this menagerie. [illegible] [illegible] way with [illegible] [illegible] curiosities. He had the Bateman children, and a dramatic [illegible]ny of St James's Theatre in London—a body of not less than fifty persons employed by him. He has the Chinese Family, and their attendants, now at the Albert Gate, London, employing ten per[illegible] He is getting up an immense [illegible]anorama of the World's Fair, having [illegible]rpse[illegible]lebrated artists to London, for the purpose of sketching it on the spot. He is the General Manager and the working Director of Phillip[illegible]ntant Fire Annihilator Company f[illegible] United States, and is driving, with his accustomed energy, that invention to a height of popularity. He is, and has been, for years, President of the Fairfield County (Conn.) Agricultural Society. He is President of the "Pequannock Bank," and regularly attends its preliminary meetings. He is an Odd-Fellow—a Son of Temperance—a "member of the Temperance Temple of Honour"—a Rechabite, and a popular [illegible]mperance lecturer—assiduously attending to all the duties appertaining to all these positions. Last of all, he is to be, it is said, the Governor of one of the States!

NEWSPAPERS IN OMNIBUSSES.—Within the last few days the conductors of the Islington omnibusses have introduced the use of the daily papers. A good sized bracket is placed against the top or end of the vehicle, in which these papers are placed, and a request is printed underneath that all passengers using the journals will, when done with them, replace them in the bracket, and also deposit a penny for the reading in a small box affixed above.

WISE GAIETY *v.* FOOLISH GRAVITY.—It was a saying of Paley that he who is not a fool half the time, is a fool the whole time. Robert Hall, who held a similar opinion, on being reproached by a very dull preacher with the exclamation—"How can a man who preaches like you talk in so trifling a manner?" replied, "There, brother, is the difference between us—you talk your nonsense in the pulpit—I talk mine out of it." The eminent Dr. Crotchet being in the midst of a frolic on [illegible] and seeing a dignified un[illegible] approaching, exclaimed, "Stop! we must be grave now!

DURATION OF LIFE AMONG THE CLERGY.—The following is an extract from the *Medical Times*.—"This paper was the first of a series of communications which Dr. Guy proposed addressing to the society on the duration of life among the members of the several professions. A preliminary inquiry into the subjects, based on the facts extracted from the obituaries of the 'Annual Register,' was brought under the notice of the British Association in September, 1846, and was subsequently published in the ninth volume of the 'Statistical Society.' In that essay it was shown that the clergy are longer lived than the members of other professions, though they do not live so long as the rural population of England, and not so long by several years as agricultural labourers. The facts contained in the [illegible] tended to confirm the results established in the former essay, by showing a very favourable duration among the clergy, but detailed comparisons of one profession with another were necessarily reserved till the completion of the contemplated series of papers. The essay was illustrated by several tables, among others, by tables comparing the clergy of cities and towns with those of rural places, the married with the single clergy, and the clergy of past times with those of the present day. It resulted from these tables, which were admitted to be based in some points, on too small a number of facts, that the clergy of rural districts had an advantage of more than two [illegible]d towns, and the married of more than five years the single. The duration of life among [illegible] last three centuries appears to have been remarkably steady, with signs of recent improvement. The last table of the series contrasted the average age, at death, of popes, archbishops, bishops of the Established Church, and Romish saints. The popes, being appointed very late in life, attained the greatest mean age, exceeding that of the archbishops and bishops by about one year, the latter surviving the Romish saints by about two years. This observation of life in the case of the saints of the Roman calendar may probably be attributed in part to celibacy, in part to the ascetic practices to which some of them were addicted."

SOUND ADVICE.—"Know," said Sir W. Raleigh to his son, "that flatterers are the worst kind of traitors, for they will strengthen thy imperfections, encourage thee in all evils, correct thee in nothing, but so shadow and paint thy follies and vices, as thou shalt never, by their will, discover good from evil, or vice from virtue. And because all men are apt to flatter themselves, to entertain the addition of other men's praises is most perilous. If thy friends be of better quality than thyself, thou mayest be sure of two things—first, that they will be more careful to keep thy counsel, because they have more to lose than thou hast, the second, they will esteem thee for thyself, and not for that which thou dost not possess."

HUSBANDS AND WIVES.—A Swiss journal furnishes us with the following romantic tale of real life.—A married couple, who had for several years lived in a state of anti-conjugal harmony, determined to part, and made an appointment with each other to meet at a notary's to sign the deed of separation. To arrive at the office of the man of law they had to cross a lake, and, as it happened, they both embarked in the same boat. On their passage a storm arose, and the boat was upset. The husband, being a good swimmer, soon reached the shore in safety. On looking round to see the fate of his fellow-passengers, he distinguished his wife still struggling for her life, and in imminent danger. A feeling of his early affections returned to him, and plunging again into the water, he swam to her and succeeded in rescuing her. When she recovered her senses, and learned to whom she owed her life, she threw herself into his arms and he embraced her with equal cordiality; they then vowed an oblivion of all their differences, and that they would live and die together.

BOOKS FOR THE FIRE.—Young readers—you, whose hearts are open, whose understandings are not yet hardened, and whose feelings are neither exhausted nor encrusted by the world, take from me a better rule than any professors of criticism will teach you! Would you know whether the tendency of a book is good or evil, examine in what state of mind you lay it down. Has it induced you to

pect that what you have been accustomed
o think unlawful, may after all be innocent, and that may be harmless which
have hither'o b
gerous? Has it
fied and impatient under the control of others? and disposed you to clam in that self-government without which both the laws of God and man tell there can b
virtue, and consequently no happn
Has it tended to abate your admin
and reverence for what is great and good, and to diminish in you the love of your country and your fellow-creatures? Has it addressed itself to your pride, yo
vanity, your selfishness, or any other of your evil propensities? Has it defiled the imagination with what is loathsome, and shocked the heart with what is monstrous? Has it disturbed the sense of right and wrong which the Creator has implanted in the human soul? If so—if you have felt that such were the effects that it was intended to produce—throw the book in the fire, whatever name it may bear on the title page! Throw it in the fire, young man, though it should have been the gift of a friend: young lady, away with the whole set, though it should be the prominent furniture of a rosewood book-ca

ANSWERS TO CORRESPONDENTS.

JOHN FOSTER wishes to know if we can recommend the National Emigration Association as a safe investment. We really must decline answering such questions. If you wish to emigrate, put by your money, and go out as an independent man, and then you can choose for yourself.

WILLIAM asks if the shape of a man's head is true criterion of his mental faculties? Yes, but it does not follow from this that the pretensions of phrenology are true. There are certain general classifications about which there can be no doubt. The broad head of the man of science, the lofty forehead of the idealist, are true criterions of character. About the skull of the idiot or the savage there can be no mistake.

J. R. SOUTHTOWN.—We believe you can only get Drew's works now at the second-hand bookshops. We are not aware that they have been republished lately.

A REGULAR SUBSCRIBER says he is twenty-three, and finds his hair turning grey. He wants to know if the hair can be preserved from turning grey. We fear not, we know of no remedy. The hair of some men turns grey very early. As

healthier life he leads, the less likely is the hair to turn grey.

S. H. asks us what we think of the plan recommended by a contemporary, viz., to copy out from some standard writer 30 or 40 lines every morning, and forcing the memory to supply as

recommend the plan. You want to gain conversational power. That can only be got by practice. Get clear ideas upon conversational subjects, go into society and express those ideas. PRACTICE makes perfect. You will learn to talk in time. If there are any intelligent women in

get—if it is to be got by you at all—the grace and the ease and the vivacity you want.

S. B.—Acts of Parliament take their title from the year in which they are passed. The instance you give—37 Hen. VIII. c. 25—means the twenty-seventh year of Henry VIII., the 25th chapter. You ask if the Queen can create a Lord Mayor?—Certainly not. Is the title conferred on mayors of cities?—Certainly not. We have only
d Mayors in England—t'
London and of York.

E. PLURIBUS UNUM.—We much question whether the coin you possess is a genuine one. At any rate, we cannot tell its value without seeing it.

SYMPATHIZER.—The government inspector of
only inqu
they have happened. We fear these terrible disasters arise either from the cupidity of the masters or the recklessness of the men, and c
not be prevented by Government or Governme
Our attention has been called to t
matter, for it has been our duty to attend inquests held on lives thus lost, and our opinion is, if men and masters are thus negligent, it is in vain that Government-inspectors inquire into such matters, and show how they may be rem died.

C. DASH.—If you want information respecting the American liners, you had better write to Tapscott and Co., Liverpool, emigration agents.

L. W. X.—The operation for restoring the nose is frequently performed. You had better call at one of the London hospitals, and learn the particulars there.

M. I. K.—We are not aware that Gibbon wrote anything beside his great work, the "History of the Decline and Fall of the Roman Empire." We cannot answer your other questions.

A CONSTANT READER wishes to know what is the precise meaning of the terms master and *journeyman*. In the dictionaries he will find a master defined to be one who has servants, and the same authorities declare a journeyman to be a hired workman. An artist working by the day or week on his employer's premises may be considered as a journeyman, but we don't think in
ich a title would be applied to him.

CASCA.—There is no index published with the "Illustrated Exhibitor." The covers for the volume are 1s. 9d., and may be had at our offi e or of any bookseller. THE WORKING MAN'S FRIEND will make two half-yearly volumes.

SAMUEL KOHEY.—"Tacitus's Annals"—not Letters, as you write—and "Cæsar's Commentaries" are both translated into English, and may be had in many forms. We recommend you the translations which have been published by Mr. Bohn in his Classical Library.

A SUBSCRIBER.—We should be glad to oblige you and three of your friends, but we really do not know the form in which "Our Evenings" is published.

A. B. wishes to know if we can recommend him how to acquire information relative to emigration, more especially as to Australia, New Zealand, and America. A "Hand-book" will speedily be published at our office, that will contain all the information he wants.

C. A. S. writes "Suppose I married a deceased wife's sister, who is a minor, and she also died in her minority, leaving a personal estate, who would become possessed of it?" Her nearest relative.

AN ACTRESS writes to us to know what is the best paint for the cheeks? We really are so little accustomed to paint ourselves, or to mix with ladies who do, that we really cannot answer her question. When we first read the question, we did not observe the signature, and were going to write in a very moral way. However, we know actors and actresses must paint, if they did not, at a distance their faces would be hardly discernible; and so we do not censure our actress, but only regret that she must have recourse to a custom so destructive of all personal charms as the use of paint.

L. B.—We are not afraid of a
with you. We stated that at this time the real preacher is the press. You ask what advice is a minister? Why, preach on, and a power that has been a blessing to the world, and we trust will long remain so. We say that the pen reaches
abides longer than the
oice, and you then ask is it then of a
importance? We beg respectfully to an
We
but in fact, we

E. H.—It may be the fault of the people. It may be the fault of the ministers. That is a question we do not care to discuss. The Rev. George Gilfillan tells us "the pulpit ought to expand and become less of an egg-cup and more of an arena." Both languages may be true or not. The question is one we cannot discuss in our pages.

M. M. P.—The master, if he promises to give up his apprentice's indentures, we presume is morally bound to do so. What the law may compel him to do is another thing, and one that we cannot undertake to declare.

A. C. wishes to know if he, when of age, is legally liable for a warrant of attorney he was foolish enough to put his name to when a minor. We believe not.

W. W.—The Supplementary Numbers of THE WORKING MAN'S FRIEND are published as usual, and may be had at our office, or by ordering them of any bookseller.

L. S. B.—It is true the Ecclesiastical Titles Bill is passed, but it does not follow that the bill must be carried out because it is passed. Parliament could have enough to do were it to see that all the laws it made were put into action. The attorney-general for the time being would have hard work of it.

L. RAY.—The Hamiltonian system is a system of teaching languages by getting the learner to begin not with the grammar, but with reading at once. Several Greek and Latin books in accordance with the system are published by Taylor and Walton, Gower-street. The system is named after the inventor. If you want a really good Latin Dictionary, you must get Riddle's.

ENQUIRER.—There is no work of the kind you mention. The time is too recent for the historian. The revolutions of 1848 and 9 have yet to be worked up into history. Publications have appeared on the individuals, but not aiming to
more than narrate fac

A LION HUNT IN SOUTH AMERICA.

To we home sportsmen, who content ourselves with the slaughter of excitements of August and September, who think a brace of grouse or partridge sufficient reward for a day's who follow the timid hare, the wily fox, and the dappled with as much speed and art as though they were really worth the catch ing we know little of the real pleasures of hunting while we know positively nothing of the adventurous excitement of the chase when a lion is the game To realise what we never saw is almost—nay, quite, impossible An extract, therefore from the accounts of one who has joined in these perilous sports may not be uninteresting We quote a passage from 'Stevenson's Residence in South America —

At Villavicencio I was highly entertained in hunting a *Paq* or Chilian lion On our arrival, the people were preparing to destroy this enemy to their cattle several dogs were collected from the neighbouring farms, and some of the young men of the surrounding country were in hopes of taking him alive with their lassos, and of afterwards baiting him in the village for the diversion of the ladies; whilst others were desirous of signalising the prowess of their favourite dogs All of them were determined to kill this ravenous brute, which had caused much damage, particularly among their horses

"At four o'clock we left the village, more than twenty in number, each leading a dog, and having a chosen lasso on his arm, ready to throw at a moment's warning About a mile from the village we separated, by different by-roads, into five or six parties, the men taking the dogs on their horses, to prevent the possibility of the scent being discovered by the lion. All noise was avoided; even the smoking of cigars was dispensed with, lest the smell should alarm their prey, and they should lose their sport. The party which I joined consisted of five individuals. After riding about four miles, we arrived at a small rivulet, where a young colt was tied to a tree, having been taken there for that purpose We then retired about three hundred yards and the colt being alone began to neigh, which had the desired effect for before sunset, one of our party placed in advance let go his dog and whistled, at which signal three other dogs were loosed, and ran towards the place where the colt had been left We immediately followed, and soon found the lion withhis back against a tree, defending himself against his adversaries

On our appearance he seemed inclined to make a stand, and attempt an escape The lassos were immediately in motion when four more dogs came up, and shortly afterwards their masters, who, hearing the noise had ridden to the spot at first

A LION HUNT

the woods would permit them. The poor brute seemed now to fear the increase of his enemies However, he maintained his post and killed three or four dogs, at which the owner of one of them became so enraged that he threw his lasso round the neck of the lion when the dogs, supposing the beast more secure sprang on him, and he was soon overpowered, but so dreadfully wounded and torn, that it became necessary to put an end to his life The length of this animal, from the nose to the root of the tail, was five feet four inches, and from the bottom of the foot to the top of the shoulder, thirty-one inches. Its head was round, and much like that of a cat, the upper lip being entire, and supplied with whiskers; the nose flat, the eyes large, of a brownish hue, but very much suffused with blood; the ears short and pointed It had no mane The neck, back, and sides, were of a dusky ash colour, with some yellowish spots, the belly of a dirty white; the hair in his natural state

…ly. Each jaw was furnished with four cutting, four canine, …grinding teeth, each of which was fixed and fitted …ce, and very strong roots.

…ed in the girths of the saddles of two …, which was thus dragged to …, where we arrived about nine o'clock, and were re…ed by the inhabitants with shouting and re…cing. …ainder of the night was spent in dancing and …

…informed me that the favourite food of the lion …, watching a good opportunity, it jumps upon …its prey, which it worries tearing the flesh with one …it secures its hold with the other after sucking the …ings the carcase to some hiding place, covers it with …, and returns when hungry to devour it If it enter a …where horned cattle are kept the bulls and cows imme… form a circle, and place the calves and young cattle in …; they then face their enemy boldly and not unfre… oblige him to retreat, on which the bulls follow him …often gore him to death It would therefore appear to be …from fear than choice that he is attached to the flesh of …. LECTURES TO WORKING MEN

ON GLASS

Monday, February 9, a lecture on glass of so interesting a …ter, as to render a report of it peculiarly suitable to our …, was delivered at the Museum of Practical Geology Jermyn …, by Dr Lyon Playfair, C B F R S, professor of chemis… In commencing his lecture, Dr Playfair briefly alluded to …stence of the Museum of Practical Geology and the valu… collection it contained of raw materials furnished by the …al kingdom Wishing that the benefit of this collection …ld be diffused as widely as possible the Director, Sir H… De la Beche, had suggested, that in addition to the usual courses …ures, daily given in the theatre of the Museum for ad…ance to which a charge is made, it would be productive of …good if a course of lectures were occasionally given for …ulative benefit of the working classes, and that to at an …e which would suit their convenience In accordance …h this suggestion, the various professors attached to the …ment readily undertook to deliver a course of six lectures …, the evening of Monday, at eight o clock This was the first …e of the course

The lecturer then proceeded with his subject which he …ded into two parts, First the composition of glass or the …ials of which it is formed and secondly some of the …ical processes employed in making glass fit for ordinary …. Glass is of great antiquity, and its origin is shrouded …ry. Various stories have been told as to its accidental …very by sailors, who, whilst cooking their dinners on the …s of the river Belus, produced such a heat as to fuse the …s of kali or soda (on which their cooking utensils were …ed, together with the sand of the shore thus producing …. This, however, is not probable as the heat thus ob… would have been sufficient for the purpose That the …yptians were well skilled in glass-making is evident from …s found with mummies, the surfaces of which are …ed with blue glass. The Romans were well supplied with …, many of which have also been discovered in …ovations now going on at Pompeii, and the lecturer requested his …s to visit the Museum, and inspect, at their leisure, …interesting memorials of the glass manufacture of other …s contained.

…ass until 1567 that glass was manufactured in Eng… …, and about three years after, that its use became general …ing the reign of Elizabeth, of that period, …ion of his master to take the glass out of …ers, and drink it with his wife's health, and all drank up with some …, which it was customary to use, lest by the …ck of the vessel from the country they should be shattered …d destroyed by the wind and rain. Thus serves to show in …what infancy the art of the window glass of those days …may have been.

…In 1661, it was but little used in Scotland, its use being con…fined almost to the royal palaces The advancement of chemi…cal …, mechanical science, however, soon led to improvements in th… manufacture of glass.

…e of a me… …tal faculties? Glass exists under two distinct forms; the one …t is that t… the other vitreous or glassy. The former may be co… …ere fine crystals of white sugar-candy. The latter to ba… …t of th… in which glassy state the particles are not arranged …in the …metrical form as in the crystalline state of sugar-candy. …t t… basis of all glass is silica (flint or sand), infusible alone …e …herefore, requiring to be mixed with some material that will serve to melt it The addition of lime will do this, but the glass thus produced will not be transparent, we must, therefore, have recourse to soda, if we wish a transparent glass, or to … ood ashes or potash

The properties of glass are, that when silica is mixed with either of the above-named substances it melts, and assumes the consistence of a thick syrup, and in this state can be moulded and fashioned, by various means, into every conceivable variety of shape and form Unlike two pieces of metal, those of glass adhere together, thus enabling it to be blown, rolled, or drawn out and even spun into articles of furniture and dress. Certain desirable properties which glass should possess, are freedom from colour and the capability of resisting the action of hot and cold water Chemical glass also must be capable of withstanding the action of acids and alkalies. That is the best glass which has the most silica in it, but then this is difficult and expensive to obtain, because of the high temperature required to form it On the other hand, that is the worst glass which contains too large a proportion of the flux or melting material such glass being too readily acted upon The great art of the manufacturer is to adjust the due relation of the constituents so as to get the glass of the kind required for the particular purpose to which it is to be applied

The sand used must be very pure That obtained from Alum Bay in the Isle of Wight St Helens, in Lancashire, and Leighton Buzzard, in Bedfordshire, is considered the best, but our glassmakers send even to Australia and to America for this raw material.

The alkaline substances used must also be as pure as possible When potash is fused with silica, the glass obtained has a dull tint but possesses freedom from colour Soda gives transparency to the glass made with it, but communicates a greenish colour Lime, when pure, gives brilliancy and toughness to glass made with it—a glass less liable to break If too large a proportion of lime be employed, the pots in which the materials are melted become injured.

Red lead, or oxide of lead, is employed in the preparation of flint glass This material renders the glass very fusible. It also imparts great brilliancy, but at the same time a great degree of softness, if the proportion used be too large.

Saltpetre oxide of manganese, arsenic, and other materials, are also used in the preparation of glass, but these are more accessories than necessary ingredients, and are usually added for the purpose of removing colour, and impurities of various kinds from the glass

The process of annealing, which all kinds of glass are made to undergo, consists in exposing the glass to a continuous but gradually decreasing temperature, for a period proportionate to the kind of glass, the size of the mass to be annealed, and the purpose to which it is intended to be applied. When this process omitted, the glass would be totally unfit for use, on account of its extreme brittleness The theory of this annealing process may thus be explained —During the natural cooling of the glass, it is evident that the external layers or surface must grow hard first, and must then tend to prevent the contraction which the internal portions of the glass would, if unrestrained, assume. There would then be always a powerful strain between the inner and outer parts of the glass, which would result in a repeated and troubling of the glass by the application of very slight causes The lecturer exhibited a number of specimens of this kind, some of large dimensions, of bottle glass, which, having been allowed to fall while in a heated

...ir melted state into cold water, had acquired a supernatural hardness to fracture. The moment the tail end of this globule of glass was broken off, the whole of the remainder fell to powder with a smart explosion. Had this globule of glass been ...the end might have been broken off, without affecting the ...part.

Dr. Playfair then proceeded to point out the classification of glass, and the various recipes employed in the manufacture of the various kinds enumerated. These particulars are given in the accompanying diagrams, copied from those referred to by the lecturer.

CLASSIFICATION OF GLASS

A Window-glass (sheet, crown, coloured)
B Painted window-glass.
C Cast or plate-glass
D Bottle-glass.
E. Chemical (Bohemian),
F Flint or crystal
G Optical.

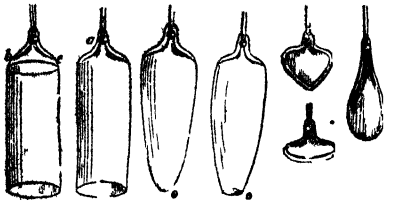
...proceeded to describe the furnaces in which the ... are placed, containing the materials of ... kind of glass is formed. The pots or crucibles, of ... Staffordshire clay mixed with the ... ground pots, or ... These, notwithstanding ... of glass, pots require great care, and ... annealing process in order to remove ... bodies to sustain the heat to which they ... these pots are placed the ingredients, ... melting is finished, and the "metal," as the ... has become free from bubbles of carbonic ... the potash, soda, &c., employed, the ... surface are skimmed off, and the fluid ... to receive any shape that may be given to it.

The tools employed in the glass manufacture ... under review, the fewness and simplicity of ... striking. These tools are, the *blow-pipe* or *blowing-pipe*, ... hollow tube or pipe; the *ponty* or *pontil*, a solid rod of ... with which the workman handles the glass whilst working; ... the *pucellas* a tool resembling a pair of sugar-tongs, and which is used to fashion and form the glass into the various shapes of which it is susceptible; the *shears* or *scissors*, which are used to cut and clip the glass whilst in its soft state; and lastly the *battledore* a flat piece of iron which serves to flatten the soft glass. These tools and a flat table of iron, or slab of iron on a wooden stand (technically called a "marver" corruption of the French word *marbre* a marble plate having originally been used) constitute the means in the hands of the workman whereby he is enabled to present us with the almost endless variety of shape and form his plastic material is capable of assuming.

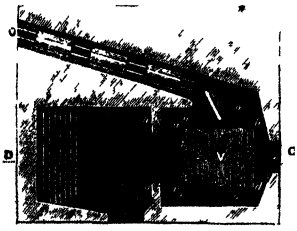


The mode of making the various kinds of glass ... under the notice of the lecturer.

As we have recently given in the pages of "The Illustrated Exhibitor" a full account of many processes, especially of flint glass making, illustrated with a large number of engravings, we shall be the more brief under this part of the learned Professor's lecture referring our readers to pages 4 and 5 of that work for further information.

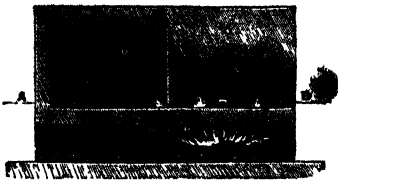
Manufacture of crown glass.—For this purpose the workman dips the end of his blowing rod into the pot of melted glass, and having rubbed it on the marver until it acquires a cylindrical form he then proceeds to take a further portion from the pot and having first blown it into a pyriform or pear-shaped bulb he rapidly flings the bulb up into the air, ... above his head, blows it in an ascending direction. The result of the operation is a flattening of the pear-shaped bulb, the part most distant from the blowing-tube or attachment striking down in virtue of its own weight. Another workman now attaches the ponty to the bottom of the blown tube, and the blowing tube is detached by dropping water on it. The hot glass near its connection with that tool, the ... attached to the ponty is then twirled round his head, and the workman by which means it expands and flies out, assisted by continual treatment the size required when it is taken to the annealing furnace and then cooled. The part to which the ponty was attached is that which we call the "bull's eye," and which necessarily exists in the centre of every sheet of crown glass.

Manufacture of sheet glass.—In this case the workman proceeds as before but instead of attaching the ponty to the other side of the glass, by lowering rapidly the blowing-tube he makes the bubble of glass to assume a kind of ... form he then causes the blowing-tube to describe a line by swinging it to and fro in a kind of pit, ... of the pendulum of a clock. From time to time, ... curved motion is taking place, the workman ... the bulb of pasty glass and the result is, that, ... the force of the breath and the effect of the ... glass bubble elongates, until it acquires a ... shape, the bulb of glass being kept in continuous ... in order to prevent its shape from becoming irregular. When a cylinder of the desired size is obtained, ... is again heated, when the workman by ... causes the glass to burst, and thus an opening is made. The cylinder is now closed at one end, and open at the other; hence, inasmuch as it is desired to ... it into a ... plate, the other end must be opened also. To effect this, the cylinder, being laid horizontally, is surrounded at the ... by cut with a string of ... glass, and this sudden ... of heat immediately produces a fracture in the required ... Sometimes the sheet is employed to cut ...



of the cylinder in the first case The following diagram gives a representation of each of the various forms successively assumed by the glass in the operations above-mentioned The

cylinder is converted into plate by the following method — Being placed horizontally upon a table a drop of water is drawn along the upper part of its surface in a straight line, through its entire length, and a piece of red hot iron being made rapidly to follow the water track a fracture immediately results



The cylinders are then, one after the other placed in the aperture o of the furnace shown in the annexed diagram, and

are gradually thrust forward on guide rods as represented, into the hottest part of the furnace As the cylinders reach the flattening table v, the workman lays hold of them with an iron rod, and places them on the table This table is formed either of cast iron, or of a thick slab of glass, covered with plaster of Paris to prevent adhesion The cylinder being now quite soft, the workman readily converts it into a plate of glass, as shown in the accompanying diagram.

The annexed diagram shows another view of the furnace, v being the flattening table, which is the hottest part, whilst u is the annealing chamber, into which the plates are transferred from the flattening tube v. This annealing chamber is of a lower temperature than the other part of the furnace, from which it is separated by a slight brick-wall. For this purpose,

tools of the following shape are used When the annealing

chamber is quite full, the temperature is gradually lowered, and the sheets of glass removed for use

In this way, not only sheets of glass, but also flower-shades, clock shades, goblets, vases, and an endless variety of glass articles are made

The lecturer's description of the above process of making sheet glass occupied so much time, that he was not able to go into the account of bottle-glass manufacture, and but briefly to mention the flint glass and plate-glass manufacture Bottle-glass will be treated of in a future lecture, and the subject of flint glass will be found, as we before mentioned, fully explained in "The Illustrated Exhibitor and Magazine of Art

The manufacture of plate or cast glass is performed by ladling the fluid contents of the pot into smaller pots, called *cuvettes*, and these, after having been heated, so that their contents may be as fluid as possible, are removed from the furnace by a particular apparatus, and swung over a flat table of bronze which has been previously heated the fluid glass is then poured over the metal table, and subjected to the action of a powerful roller A uniform sheet of plate-glass is thus obtained, in the same way as a sheet of lead or other metal The plates of glass are then annealed, after which they are ground smooth, and lastly, polished by means of colcothar, a substance formed by exposing sulphate of iron (copperas) to great heat

The lecturer here noticed a discovery of boron which has recently been made in America—a discovery of great importance to the glass manufacturer, who, if the price of boron is reduced, will be able to avail himself of the use of this material to enable him to employ oxide of zinc (instead of lead)—an ingredient which gives great whiteness and brilliancy to the glass

Dr Playfair then touched on optical glass, the great improvements in the manufacture of which has been of great service in the construction of good microscopes and telescopes, thus leading us to a more intimate acquaintance with the wonders of creation

The lecturer next instructed his auditory in the way of making imitation gems, some fine specimens of which he exhibited. The following is a full account of the preparation of the strass, which, being itself free from colour, is the base of the various gems, which are formed by the simple addition of the substances enumerated to the colourless strass.

Ruby —Strass, 1000, Oxide of Manganese, 25

Emerald.—Strass, 1000; Oxide of Copper, 8; Oxide of Chromium, 0·2.

Sapphire.—Strass, 1000; Oxide of Cobalt, 16.

Amethyst.—Strass, 1000; Oxide of Manganese, 8; Oxide of Cobalt, 8; Purple of Cassius, 0·2.

Aquamarine.—Strass, 1000; Oxide of Cobalt, 0·4.

Carbuncle.—Strass, 1000; Oxide of Manganese, 4; Purple of Cassius, 4; Antimony Glass, 500.

The last point touched on was the process of silvering mirrors and other kinds of glass. The method still most generally adopted, is that of placing mercury or quicksilver on a flat piece of tin-foil, then carefully laying the glass thereon: the mercury and the tin unite to form an amalgam or mixture, which attaches itself as a coating to the back surface of the glass—thus forming a mirror. In driving off the excess of mercury by heat, the vapour produced is very prejudicial to the health of the workmen; hence, the introduction of the new process—which is applicable also to glass vessels and ornaments, to which the old process cannot be applied—namely, by using a solution of silver in nitric acid, mixed with grape sugar or essential oil of cloves and cassia, by which means, pure *silver* (not quicksilver, as in the other case) is speedily deposited, of great brilliancy and beauty, and without the slightest injury to the health of the workman.*

Dr. Playfair concluded his lecture by referring to the valuable uses of glass—its application to our comforts and to the extension of our knowledge—and retired amidst the acclamations of the 500 working men, who thus gratefully acknowledged the intellectual treat afforded them.

* A detailed account of the new processes employed in silvering glass, will be given in "The Illustrated Exhibitor and Magazine of Art."

THE GENIUS OF YOUNG.

The Author of the "Night Thoughts."

The more the human mind contemplates the subject of poetry, the more deeply is it impressed with the might of its power and the immensity of its domain. Between poetry and the sister arts there may be an occasional comparison, but there can be little competition. For while it is common to them all to be conversant with the taste and the imagination, poetry alone lays hold of the whole circle of the mental faculties, and calls them each into its appropriate exercise. In Milton's "Paradise Lost" there are specimens of as sublime reasoning as was ever addressed to the human understanding, while the instances of beautiful imagery are as abundant as the finest imagination ever invented. The *Poet*, according to the original meaning of the word, is a *Creator* and a *Combiner*. He is the true architect of thought, who plans, arranges, constructs, adorns, and distributes into harmonious proportions. He "builds the lofty rhyme." To our own perception the dignity of genius never appears more imposing, unless we except those instances of extraordinary scientific ratiocination and invention, which have bowed the very heavens to the intellect of man, and laid bare their mighty mechanism, or seized, combined, and applied the elements of earth in such ways as can never cease to astonish us, however familiar we may become with their operations.

Great inventions and discoveries are counted by centuries, while poets of some kind appear from generation to generation, and not a few illustrious ones have from time to time adorned the world. It will be found, too, that the most *natural* poets have been the most successful, those who have touched the actual chords of emotion which the hand of the Creator has strung in the interior of man, or copied with a faithful pencil the ever-varying features of the external world. Human passions are so strange and strong, so various and vivid, that he who truly deals with them, he who in the progress of his imaginative creation departs not from the principle of verisimilitude as concerning the passions of the human soul, can never fail to arrest attention and secure admiration. Hence the perpetual triumphs of Shakspere, who wrote of man, to man, and for man to the end of time. Those rich flowers of his fancy were but incidentally scattered by the way. The grand march of his mind was through the interior of the soul of man. Other poets have been skilful and powerful in the delineation of particular passions, whether profound or impetuous, tender or terrible, gentle or cruel. Like the insect which spins its web out of its own bowels, they have woven together threads that have been painfully drawn out of their own hearts. Whatever the theme they have chosen, they have essentially described or illustrated the same set of passions. Whether they sing in the major or minor key, the character of the tunes was the same. Byron is always reproducing himself with his train of fiery passions, his pride, misanthropy, defiance of God and man, illicit love, vaulting ambition, self-torture, and destructiveness in general, relieved over and anon by all that is beautiful in creative poesy. Moore, over whose birth, according to the doctrines of astrology, the planet Venus must have presided in solitary beauty, is forever melting away in the passion of romantic, oriental love, while his lines flow like the music of a bird that just opens its mouth to let forth strains that seem all but involuntary. Campbell, amid all his elegant conception and polished execution, constantly betrays his love of liberty and hatred of despotism, and is never satisfied until by some single creation, like that of the ode, he can give vent to the smouldering fires of patriotism within his breast. Those spirit-stirring odes of his, if they do not, like the "Pleasures of Hope" and "Gertrude of Wyoming," prolong the pleasing enchantment of the mind in the perusal, do rouse all that is excitable in our bosoms. They are as perfect, as polished, as expressive as those beautiful forms of statuary, which have conveyed to us the conceptions of the Grecian mind, while in animation they surpass them, as burning words surpass the cold marble. Cowper may always be found communing with the sweet charities of domestic life, describing the most obvious and simple features of external nature, or marking with his gentle satire the follies of society, with an occasional strain against every form of oppression. The genius of Thompson spreads itself out over the whole panorama of Nature, giving us one vast and varied picture, the colours of which are found to be very enduring.

Now, in analysing these and similar productions of the muse-inspired mind, or of genius as it produces other results, whether in the walks of painting, sculpture, architecture, or the drama, nothing strikes us more agreeably than the element of *likeness*. It seems to be an original principle of our nature to be pleased with resemblances. The accurate painting of a flower, a shell, or even a vegetable esculent—the sculptured imitations of animals, either of the fierce or gentle class—the pictorial representation of the homelest scenes of peasant life—the poetic delineations of life even in poor and coarse aspects, as in the pages of Goldsmith, Burns, and especially Crabbe—the dramatic imitation of the actions and manners of men and women who have figured on the real stage of the world, whether in comic or tragic strains—all these never fail to interest, and that in proportion to the perfection of the resemblance. But this is only one element of pleasure, however widely diffused. A celebrated critic, ... perhaps too strong a tendency to generalisation, has said:—"The chief delight of poetry consists, not so much in what it directly supplies to the imagination, as in what it enables it to supply to itself; not in warming the heart by its passing brightness, but enkindling its own latent stores of light and heat; not in hurrying the fancy ... by a foreign and accidental impulse, but in setting it in motion by touching its internal springs and principles of activity." Then this must be done by striking a note to which the heart's living affections will instinctively respond, by rousing one of a large family of kindred impressions, by "dropping the rich seed of fancy upon the fertile and sheltered places of the imagination." Hence the power of what may be called reminiscent poetry, or that which leads us back to past scenes, or in the fertility and truth of its imaginations so describes things to us that we instantly recognise their likeness to what we have ourselves experienced. The scenes of childhood and youth—the fireside enjoyments—the rural walks—the sail over the bosom of the lake—the mineralogical, botanical, piscatory, inventatory excursions—the wanderings among the sweet and solemn woodlands, vocal with the music of the heaven-taught warblers—the old school-house, and even the "old oaken bucket," in which we drew the sparkling waters from the deep fountain below—all these are animating themes, however minute, and we feel a kind of reverence for him who can reproduce them to our view.

The poetry of Young is not without its tenderness. How could it be otherwise when the spirit of affliction had so often troubled the fountain of feeling in his heart? The reading world is familiar with the apostrophe to the "Insatiate Archer," by whom the peace of the poet was "thrice slain." Hence the solemn tone which pervades most of his poetry. He seems to luxuriate in a kind of delicious melancholy, which gives a character and zest to the productions of his muse, and awakens our sympathy for one who has been so often placed in the furnace of affliction. His imagination, unlike that of Milton, which invites the light of Heaven's day into his soul, rather woos the night for its creations, and solemnly invokes

"Silence and Darkness! solemn sisters twine
From ancient Night, who nurse the tender thought
To reason, and on reason build resolve,
Assist me! I will thank you in the grave."

With the whole strain of the poet's reflections, whatever be the scene, the solemnity and stillness of night seem congenial. Hence there is a profoundness of contemplation, a seriousness of manner, a sublimity of thought and devotion, even a weight of instruction in his poems which deserve the highest commend-

---

good account. Young had an alcove in his garden, with a bench so well painted in it that at a distance it seemed to be real, but upon a nearer approach the illusion was perceived, and this motto appeared: *Incredibilia non decipiunt. The things unseen do not deceive us.* Nor was he destitute of wit, for occasionally he indulged in an epigram keen and caustic, as when hearing of the ridicule the infidel Voltaire had cast upon Milton's allegorical personages of Death and Sin, he extemporised the following —

Thou art so witty, profligate, and thin,
Thou seem st a Milton with his Death and Sin!"

Much of his poetry is, in fact, seriously epigrammatic strong figurative, yet sententious and striking, it has fastened itself with a firm grasp on the readers of the English language, and while Dryden, of the same century, preceden in the race of fame, and Swift, nearly contemporaneous in birth with Young, are comparatively neglected, except by scholars, Young maintains his place among the living classics of the language, read, meditated, and admired. The truth is that with all his turgescence and want of that simplicity which is the charm of some writers, he strikes deep into the soul of his fellow man, and we find, in fact, that what seems

---

intent to publish a meagre [illegible] writing a full and satisfactory memoir, like those of Pope and Dryden, a letter which is chiefly taken up with indulgence of empty speculations, in settling trifling dates or narrating unimportant circumstances, with not the slightest attempt to do justice to this lofty genius, or to investigate the philosophy of his poetry.

Johnson does indeed say that "the Universal Passion" is a very great performance, and bestows positive though brief praise, on the "Night Thoughts." Here indeed he confesses there is "original poetry, variegated with deep reflection and striking allusions, a wilderness of thought, in which the fertility of fancy scatters flowers of every hue, and every odour." The style and sentiment of these "Night Thoughts" are peculiarly favourable to the use of blank verse, so that the poet exhibits judgment as well as genius in the composition of this work, and all the reverent emotion, that seems to fill his soul, then a boldness of thought, and a freedom of utterance which illustrate that the flight of that genius is not impeded or restrained by wing. Time, Life, Death, Immortality, with all their transcendent grandeur, their mighty adjuncts and vast consequences, constitute the themes on which he dwells, and while he handles the "thoughts that breathe and words that burn." If he be not so exact, he is always copious. If there be lines that might be excepted to, or amended, there is great power in the work as a whole, for in this there is a magnificence like that described to a Chinese plantation, the magnificence of vast extent and endless diversity. If there be a failure in any portion of his works, it is in his "Last Judgment." Not that it does not breathe the spirit of genuine poetry in its conception, but that many of its details are not graphic, powerful, and striking, but that it is a subject to which neither painter nor poet can justly aspire. Inspiration itself barely touches it, and moves on to things more intelligible to man, more suitable for his investigation. It is sparing of description, and Young is most descriptive of poet. Things great, visible, tangible, audible, must necessarily be dwelt upon to set forth a purely spiritual process, quite different we may presume, from any thing the imagination has conceived, or is capable of conceiving. The idea of limbs dangling in the air in pursuit of their flown limbs is deeply incongruous, and would be ludicrous, but for the solemnity of the theme and our respect for the intentions of the author. So the comparing the assembling of the atoms of the human body to the collection of bees into a hive, and the thinking of a pan, has been justly censured by Johnson. Some of these descriptions present extreme cases of [illegible] of metaphor, which is a characteristic of Young's [illegible] for these, and the preacher is there, and it is impossible for a [illegible] mind to study these strains without being deeply affected; but it would seem difficult for a thoughtless and not to be misled serious by the same study. They pro-

---

our moral nature.

Swift observed that if Young in his natures had been more gay or more severe, they would have been more pleasing, because mankind are more inclined to be pleased with ill-nature and mirth than with solid sense and instruction. This may be true, but he would no longer have been Young. Doubtless there is a class of readers who would rather feast on the failings and follies of others than be delighted with their virtues. Such would be more gratified with the scorn and the vein of Byron's muse than the gentle inspirations of Cowper, or the serious strains of Young. But the fame founded on such a basis is evanescent. Doubtless the shade of that proud peer of the realm of poesy would gladly exchange all its earthly honours and posthumous fame for the conscious sense of the world of retribution of never having written a line to impugn the sense of virtue, or to invest vice with such enchantment as none but such a poet is capable of creating. He differs must be the feelings of him who, while he held the pen of composition in his hand, felt the weight of responsibility of his heart and sent forth to an admiring world "a line which, dying, he would wish to blot," no sentiment which in the land of retribution he would wish to recal. If were preferable even to be subjected to the charge of being gloomy, were the heart made better by that sadness, than to jest at sacred things, and deride the hopes founded upon the sublime revelation from God to man.

The contrasts of Young constitute one secret of his impressive power. Thus —

How poor, how rich, how abject, how august,
How complicate, how wonderful is man!

An heir of glory, a frail child of dust,
Helpless, immortal, insect infinite
A worm, a god—I tremble at myself!"

No man can attain to the true dignity of his nature without a long and patient introversion of the observing faculties. If "the proper study of mankind is man," the greatest proficiency is attained by studying ourselves, by descending into the interior chambers of the soul, and observing the operation of its complex machinery. Nobly does Young say—

"Man know thyself, all wisdom centres there
To me no man seems ignoble but to man!"

If Michael has fought our battles, and Raphael has sung our triumphs, and Gabriel has spread his wings from distant worlds to bring messages for the benefit of man, why should he live so far below his dignity?

Young followed in the track of Milton when he taught us to believe more firmly in the proximity of celestial spirits to the dwellings of humanity. In yielding our faith to such a [illegible] we are led along by a poet's fancy, we are

which speak of the "angels as ministering spirits sent forth to minister to them who shall be heirs of salvation." A beautiful idea is that of the sacred interlinking of those heavenly ones with us poor visible pilgrims of earth. How often, when fainting in the wilderness, like the poor Egyptian mother, has the angel of hope appeared to revive our spirits, and point to some grateful fountain in the desert, unseen by us, because our eyes were dimmed with tears. And so, under the same kind Providence, we are taught that friendship is something more than "a name."

> "Heaven gives us friends to bless the present scene,
> Resumes them to prepare us for the next
> All evils natural are moral goods,
> All discipline indulgence, on the whole."

There is, in fact, in the poems of Young a mass of true philosophy, which, were it but drawn out in scholastic form, would constitute quite a volume of sound instruction on good ethical principles. The purity of his productions is most exemplary, considering the license indulged by his contemporaries, and the fact that the age of Anne had by no means freed itself from the pestiferous influence of the age of Charles II., the royal debauchee, who enthroned vice in his court while he banished virtue to seek a refuge among the despised Puritans. Dryden himself sometimes dabbled in pollution nor was Swift altogether free from the charge of puerility the baser passions of the human heart But the most bitter enemy of Young could never bring such an accusation against him.

How much domestic experiences—in fact, the general fortunes of a man's life—have to do with shaping and colouring his works as an author, it is not necessary to discuss The connection is as important as it is undoubted of this the history of authors is abundant proof In his preface to "The Complaint," Young says that the occasion of this poem is real, not factitious, and the facts mentioned did naturally pour those moral reflections on the thoughts of the writer

Much of the character and achievements of the executive portion of our race depend on the intellectual discipline of the mind, not alone the intellectual but the moral discipline to which men are subjected The trials in every department of exalted action have been the test and the crucible Such names as have been given to us doubtless at once immediately suggest a train of trials, the last of which has been disclosed to the world How great a portion has been endured in secret, we can only conjecture Like two great names in England's literary history—Milton and Scott for the latter was a thorough English loyalist, though a true Scotchman What burdens those men carried through life! On genial tempers such discipline has the happiest effects On the sullen and morose it descends like water on the rock Many a tender thought, many a touching description, have we from our author, in consequence of the heart crushing he experienced by its repeated bereavements

Some authors have a peculiar faculty of diluting until its spirit and vigour have almost evaporated all thought may be original, it may be valuable but they spread it out as a goldbeater expands gold leaf, until it becomes illusive palpable. Not so with Young His wire will be found works a great amount of real bullion weighty and valuable Nor is he wanting in variety For, although his poetry calls upon the ear there may be a seeming sameness in it, there is, in fact, in the staple of it great diversity of thought, as well as richness of metaphor There are poets who have had a finer ear for the harmony of numbers, and the impressive melody of well-chosen cadences, but who are deficient in that sustained vigour which characterises Young

He has a peculiar versification, so much his own, that it would be recognised by the ear as soon as the face of a friend by the eye, on the repetition of a half-dozen lines, even if they had never before been read He is no copyist, except from the book of nature and the heart of man "He seems to have read up," says Johnson, "no stores of thought or diction, but to owe all to the fortuitous suggestions of the present moment. Yet I have reason to believe that when once he had formed a new design, he then laboured it with very patient industry, and that he composed with great labour and frequent revisions. His verses are formed by no certain model."

His antithesis, which is perpetual, is not the polished and carefully balanced antithesis of Pope, but of Young, sudden striking, weighty, and making a constant demand on exclamation points. Witness this bold succession of lines:

> "Is it in words to paint you, oh ye fallen?
> Fall'n from the wings of reason and of hope!
> Erect in stature, prone in appetite!
> Patrons of pleasure, posting into pain!
> Lovers of argument, averse to sense,
> Boasters of liberty, fast bound in chains!
> Lords of the wide creation, and the shame!
> More *senseless* than the *irrationals* you scorn,
> More base than those you rule, than those you pity!
> Deepest in woe from means of boundless bliss,
> Ye cursed by blessings infinite! because
> Most highly favoured most profoundly lost!
> Ye motley mass of contradiction strong!"

A reader who should travel through the pages of Young at consecutive sittings, would feel that an overwhelming impression was made upon his mind What it would definitely and distinctively be, it might be more difficult to say than what it would *not* be It is certain the sense of the obligations of virtue would not be lessened, the consciousness of immortality would not be enfeebled the anticipations of the retributive period would not be impaired, nor the dignity or the destiny of man be diminished in their apparent importance.

His poetry is not only descriptive, but didactic, and that in a different sense from the didactics of Pope It is a serious improvement on the ethical tone of that ambitious poet, for it reverently draws from a higher source the motives for obedience to the lessons it inculcates

In all his works, says Blair, "the marks of strong genius appear His Universal Passion possesses the full merit of that name Conciseness of style, and lively description of sentiment is particularly requisite in satirical writing Of this his compositions Though his wit may sometimes be thought too sparkling and his sentences too pointed, yet the vivacity of his fancy is so great as to entertain every reader In the Night Thoughts, there is much energy of expression in the first place there are several pathetic passages and scattered through them all happy images and allusions will present themselves occasionally

If the terms have pronounced, description be a good test of poetical imagination, distinguishing an original from a second rate genius a creator from a copyist, then must unquestionably stand high in the tuneful tribe, In many lines exemplifies a spirit of bold conceptions, and a correct originality in his chosen style of composition, with an imagination inventive and luxuriant, indeed, if not "all compact the very excursions of which while evidential of communion with the upper world the principle of virtue, and the detestation of falsehood and hypocrisy, an imagination which, if sometimes it does violence to a delicate and fastidious taste never violated our moral sense, or tinges with a blush the cheek of innocence

His poetry is the effusion of a mind that held communion with exalted thoughts and solemn associations In some parts it rises into the dignity and grandeur of the epic, for that method which essentially reveals in the mind of Milton, the "ways of God to men"—seems to have been more akin to that of Young, and thus was his spirit ever kept in view in the midst of a crooked and perverse generation, having little of the fear of God before its eyes It was an age of *freethinkers*, men who, in the plenitude of their vanity, boasted in that self-bestowed Young demanded of them to "look on truth unbroken and entire, on truth in the system of God.

> *Art* like half sentences confound, the whole
> Conveys the sense, and God is understood,
> Who no in fragments writes—human race,
> *Read his whole volume* haply *then* reply!
> Just this is *thinking free*, a thought that grasps
> Beyond a grain, and looks beyond an hour"

Let the reader peruse the dozen succeeding lines in Night VII, "The Complaint," and he will be struck with their power and sublimity If, indeed, my criticism should allure him to the perusal or reperusal of the whole volume, I shall not have written in vain.

LORD GRANVILLE.

GRANVILLE GEORGE LEVESON GOWER, the present Secretary of State for Foreign Affairs, the second Earl of Granville, was born in the year 1815, and consequently is of a far more juvenile age than the veteran statesman whom he has displaced As Lord Leveson, his lordship had a short political career in the House of Commons, which terminated in 1846 His lordship has sustained various public characters as Deputy Lieutenant of North Shropshire, as Master of the Buckhounds to the as a Commissioner of Railways and as Under- y of State for Foreign Affairs The Great Exhibi- s the means of bringing him more directly into public

LORD GRANVILLE (POLICE LEVISON GOWER)

life His active exertions as one of the Royal Commissioners did much for the advancement of that great and glorious undertaking At the same time, his lordship took an active part in the business of the nation, he being one of the readiest and most pleasing speakers on the ministerial side in the House of Lords But the events of the last few months have made his lordship more of a public character than ever At the end of last year rumours of a split in the Cabinet became very common. The knowing ones said that Palmerston and Grey were on the worst possible terms, and that Grey was to be kicked out Then other men, equally knowing affirmed that the ministerial difficulty was the ballot However, on

immense astonishment of the public, it was stated publicly in the *Times* that Lord Palmerston had resigned office, and that Lord Granville had been nominated in his place. The wisdom or necessity of that step we care not to discuss now Lord Palmerston's own expression of approval of the recent *coup d etat* in France was a mistake, but one which was shared in by the Ministers as well If he was faulty in this respect, so also was the Premier himself We must suppose that the change has been made as much on personal as public grounds We regret the change The merit of Lord Palmerston was that he was pre eminently a British Minister—that he watched over British interests—that he defended British rights. Of Lord Granville we may hope less, else why do the reactionary Governments of the continent rejoice in his elevation to office This is a fact calculated to excite suspicion, so is another fact which has recently come out—viz, that his wife is a very firm Roman Catholic Those who have read—and who has not?—Michelet's Priests, Women, and Families," will regret that the Secretary for Foreign Affairs should have chosen a Roman Catholic as his wife

In August when the grand fetes took place at Paris to commemorate the Great Exhibition, Lord Granville made a speech which won for him great popularity His lordship addressed the company in French, and throughout the whole of his exceedingly interesting address, delivered with great feeling and

tinued applause He said, "Monsieur le Préfet and gentlemen —Permit me, in very indifferent French, but with heartfelt sincerity, to thank you, in the name of Prince Albert and of the Royal Commissioners, for the honour which you have just done them As to me, gentlemen, the impressions of my youthful days, the bonds which I have since contracted the remembrance which you have been pleased to preserve of him whose name I bear, and who devoted so many years in cement ing the union between England and your lovely France, which he had learned to respect and to love as a second country of his own all this gentlemen, causes me to feel at the same time exultation and embarrassment at having the honour so little merited by me of being the organ of the Commissioners before this brilliant assemblage, at a fete of which the magnificence is only equalled by the cordiality of your reception The desire had caused itself to be felt in England to attempt there one of those which they have adopted for the purpose of dissipating the prejudices which might still arise, and for the choice which they made of the persons who have aided in the execution of the plan with so much skill and conciliation. We never entertained the pretension of getting up an English exhibition of the industry of the world, but we considered it as an influence honour to be able to offer to other nations the means of displaying their own exhibitions as integral parts of that great work Gentlemen we have also to thank the French exhibitors for the splendour and elegance which they have imparted to the Exhibition by their products They have more than confirmed their ancient reputation for the invention and good taste which prevail in the execution of their manufactured goods I trust that the sacrifices of time and money which they have made will not be altogether lost to them, even in a commercial point of view I hope also that they will not feel

PAINTING ON THE CASKET PRESENTED TO PRESIDENT LOUIS NAPOLEON

grand National Exhibitions which had so well succeeded in France, and which had been marked by such useful results Prince Albert had thought that that idea could be enlarged and its advantages extended if at a moment when all countries were drawn closer together by the progress of science and by the spread of education, they were invited to exhibit together their products so varied in character It appeared to him that such an exhibition would serve to mark the progress of civilisation in its present state, and that whilst it taught us to render thanks to the Creator of all things for the benefits with which He loaded us, it would also prove to us how much the common happiness could be increased by the union, not merely of individuals, but of nations I am specially charged by Prince Albert as well as by my colleagues on the Commission to thank Prince Louis Napoleon and his Government for their most ready co-operation, for the sage and enlightened measures

my jealousy to wish our people profit in some degree by the lessons which they have given us Our thanks are due, above all to those men so distinguished in sciences arts, and manufactures whom France sent over to us as members of the jury

Besides the portrait we have given of the new Secretary of State for Foreign Affairs we have added an engraving of an elegant casket of porcelain de Sevres presented by the present of the French Republic to his lordship, in consequence of the urbanity displayed by him, as one of the Royal Commissioners during the Great Exhibition The casket is of ebony and is decorated with nine pictures representing scenes in the life of Rubens In the one engraved being the principal one, we have Rubens taking the portrait of Marie de Medicis in his picture of the apotheosis of Henry IV.

NORAH.—A STORY OF IRISH COURTSHIP.

Norah Cooney sat spinning in her mother's humble cabin. Since daybreak she had worked at the wheel with unresting fingers, but the song with which the girl was wont to beguile labour of its wearying sameness had not once in all those hours been heard in the little room, and the hum of the wheel was almost mournful without that pleasant accompaniment. But Norah had no heart to sing this day, though it was one of the very brightest and pleasantest, though the cabin was re- [illegible] with sunlight, there was not a ray to cheer her spirit—Norah's heart was almost breaking

very day a letter had come from Tim in America, urging his mother and sister, more importunately than ever, to hasten before autumn set in to that good land of his adoption—that land which, according to his representations, was literally overflowing with milk and honey. And Tim, the gallant, brave-hearted, industrious Tim, had added to his entreaties an inducement which, of itself, was powerful to coax every thankful shade to the brow of mother and sister—Tim had married with a Yankee girl! The bride, too, sent word by Tim, that she begged her dear mother, and her sweet sister Norah to come with all haste over the waters, where they would share one home for his sake who was so dear to them all.

Great as was her love for Ireland, Mrs. Cooney had now resolved to obey that call—she would emigrate. Norah did not finished reading the letter when the old woman expressed her determination, her readiness to go to that foreign land. The fact that Tim was prospering there, and that John, the eldest boy, had frequently written to tell all the glorious beauty of the strange land, of the "room and to spare," the work and the pay, now settled her mind on a point that had long been mooted by Norah and herself. John went a married man, from the Emerald Isle, in a way we shall see well—but his wife was a fiery sort of a Kathleen, and he himself was diffi[illegible] sant person, altogether, from Tim the darling boy whom the mother and sister had seen depart from the old home with so much sorrow. All the eldest son's persuasions, if urged on the day of doom, would never have induced them to break that tie of habit and natural love of country which bound them to the native land. But Tim's words were more like magic, and Mrs. Cooney said that another week should see them on the great ocean on their way to him.

There were some reasons why, however, of a modern imagination, there should have been more grief than joy and curiosity in Norah's heart.

As the day drew near it closed and the bright of the setting sun streamed so gaily in at the window, the air sweet [illegible] grew sadder and more solemn, and more than once the tears kept back all day, so blinded her eyes that she could scarcely see to go on with her work—yet she would not rest from the labour, so the tears were forced back—and once she tried to sing, but that was a feeble, unsuccessful effort, that even if it had not been interrupted by the opening of the cabin door, would of itself have soon died a natural death.

The individual about to enter the cabin paused as he opened the door, and preparatory to introducing his person, gave a single rap. It was Felix Lever, Norah knew, for this was the half-familiar, yet respectful mode of his entrance, always, to that cabin. Felix had been Tim Cooney's intimate friend, and the only reason that they had not emigrated together, was the deep, passionate love of Lever's old grand parents for their native land. In his ardent longing to emigrate, the young man had urged every reason for them seeking another home and a better living in the new world, but their attachment to the "auld place" was beyond the reach of argument. Felix might have talked on for ever to no purpose. The possibility of going without them and leaving the old people with no one to look after and care for them, never occurred to him, or if the thought did once intrude itself on his mind he banished it at once and for ever—resolving that he would always cleave to the parents of his dead mother, through poverty and hardship, to the end, whatever that might be.

After Tim departed, Felix had fully performed his duty to in need of his help, or "*just to see had they heard from Amerikay since the last.*"

The sight of this fine fellow, who had been just a brother to Norah since John, and more especially since Tim left, caused an involuntary explosion of all that grief which had been lying so heavily on her heart. Felix paused a moment, quite overcome with surprise at her distress. He had never heard her sob so piteously before—and he had seen her when she was in heavy sorrow too.

Seeing that she did not look upon him, the youth gathered courage, and thinking that he might in some way comfort, at least help her, if she needed aid, he went in and sat down beside Norah, and just as he was going to venture a word, she lifted up her head—her foot was gently beating again on the foot-board of the wheel, and her hands busied with the work.

The sudden and unexpected exercise of self-control so astonished Felix, that he quite forgot what he would have said, and there was nothing left for Norah but to speak—so she said, but it was with that desperate effort which most of us have made when we feel we must say something at a time when we would give almost the world for power to creep away in silence and unnoticed.

'I'm a fine gu[illegible]t like a fool, what did you stop to see me do it for.

If need we was sick, Norry shall I go find yer mither now he answered, rising as if to go. He kept his eyes fixed on her so kindly, and withal with such a tender look of inquiry, as if he felt for her in her sorrow, whatever it was, that the girl felt compelled, as it were, to say—

'Stay, Felix, till I tell you, we're going to Amerikay, that's all.'

The *that's all* was spoken with such a trembling, despairing tone as told that it was the very climax of a stern fate.

Och, don't be [illegible]the saying *that* don't be laavin; could live and—there be dark days enough without that happening, Norah.

After a silence of some seconds, he added—"Did you hear from Tim the day?

'Yes, this morning, an mither *will* go. Tim's got married, Felix, to one o' thim Yankee guls."

The palpeen' will not be comin' over here with the like o' her.

"No, we're going to them, I said. Find out when the first vessel goes. We must go in that."

"An' laave this cabin, and the nice comfortable things that's bin yer own yer own an' yer out, ever an ever so long! Faith an' we can't at for the ould folks I'd be afther going along wid ye mavourneen. It's not worth much to live away from yees, ayh.

She looked up so proudly when he said this, that Felix, who had never in his life dared to speak of marriage with the girl, dared to do it now. And never was a warmer, truer heart offered to young maiden than that laid before Norah Cooney in the self same hour when the necessity of parting was upon them.

"Go, Norah, for ye must," he said; "but tell me afore ye do it, that ye'll take the thought o' me deep down in yer heart, where none o' thim foreigners will get at it. Give me the token that ye love me, an' that ye'll be thrue to me when ye get to that great new world over the sea. It's not much I am to ask the like of you, but I've a thrue love that's better nor the best cabin in Ireland with heaps of turf and potatoes! Just say that ye'll keep me in mind till I come afther ye, Norah Cooney."

"I'll say it, Felix, an' I'll keep the oath—the Holy Virgin forget me if I forget. It's many an' many a time I'll think o' yees, an' the thought'll keep the home sickness away from me heart, which even me own mauther, an' Tim that's so dear, couldn't keep off, darlint. When ye *can* come, ye will—it's enough, that—don't say no more."

They parted that night with smiles, for the bitterness of Norah's sorrow was gone; and, in a few days later, when Felix's hand clasped hers for the last time, they parted with smiles also—smiles which hid the gushing tears—smiles which, when they faded from the face, went down deeper into the natures of these two, to attend in their hearts the hope that [illegible] path which she

to which they were hasting, a light was glowing that cast no shadow. In the new home which the widow and her daughter were seeking, "a warmer fire than any ever made of peat, cast its ruddy light abroad—love! love! what an annihilator of time, and distance, and separation, and hardship it was to that Irish girl! what a cheerful, hope-inspiring friend it was to Felix Lever when he was parted from the dear object of his affections! it cheered him through all the trials which compassed him, and though he could not fight himself free from those trials, he combatted manfully with them, and kept his eyes fixed on the one bright point of the future. He was a fine fellow, that Felix Lever, industrious, religious, and cheerful, and kind always, and if ever poor mortal deserved a blessing, it was surely he.

Norah was a very pretty girl, indeed, and Tim, who clasped her so fondly in his great powerful arms when they met at last, was not slow in saying the same to her face—for Tim was a privileged mortal, he always said what was in his mind, and from boyhood he had been extravagantly fond of his sister. Since John and he had left Ireland she had grown very pale-cheeked and fair, she always was, and her dark hair curled on her neck now as it used to when a child; but Norah was become a woman—experience and love, those mighty developers, had made her so, and neither the Yankee nor the Irish sister-in-law might compare with her in point of beauty.

A hearty welcome did the emigrants receive when at last they arrived at their new home, and gladly was room made for the new comers in Tim's little cottage. The brother was not yet astonishingly rich in worldly goods, but his house was certainly an improvement on the cabin where he was born and bred—the neat habits which Mary, his wife, had brought home to her father's farm-house, were such as made the most of all the worldly goods which he had been enabled to gather together and endow her with on their wedding day; and so the cottage had a far more comfortable and pleasant set off than the cabin had in its best days.

Norah was naturally swift and handy with her needle, and it was not necessary for her to go out to service through Tim's influence she found employment enough at home in the needs of her own station to keep her constantly busy. And Tim himself, who was in the summer time a gardener in the winter also became metamorphosed into a tailor, not a man, and plied his needle with a commendable diligence. As to the mother of all, it was arranged that she should her time between the two sons' families—of course, for Norah Tim's house was a constant abiding place.

So were they settled, contentedly and comfortably in their new homes, and Norah turned to her toil with patience looking forward to the time when Felix should come and make their household joy complete—he alone was wanting to perfect her happiness. There was nothing, she constantly assured him, for the poor to do, but to come to this good land where work and pay in abundance were to be had; and how he longed to obey her call, and how piously he hushed the longing in his filial piety, I need not say.

There was a cousin of Miss Tim Cooney, a young blacksmith, who lived in the same village with them. He was a shrewd, industrious man, who was bent on making money, which, in his wise prudence, he laid up and never did any one look better than he when following his *pretty cygnet* calling. All the girls in H— thought so, and there was not one in his sphere of life who could not have summoned up sufficiency of love for him to have warranted marriage any day he had chosen to ask for it. But the blacksmith had not fixed his heart on any of his own kin, nor lost his heart to any of his own country, Norah Cooney alone answered to his idea of perfect beauty and worth in woman. He had seen her often in his frequent visits at Tim's house, had been enchanted more than once by her touching song, nothing so lovely had he ever heard as her "Kathleen O'Moore." "The Exile of Erin" was invested with the very soul of music as it came from her lips. From listening to her songs, from watching her quiet ways, her gentleness, her care for the poor mother, her affection for Mrs. Tim, his cousin, for her womanliness in the performance of duty, it was, that Miles Brewer loved her, and thought what a jewel of a wife she would be. But Miles had no courage to tell her of it, and no incident turned up in his converse with Norah that would lead directly to the broaching of that subject. There was nothing left for him but to speak with Tim's wife about the matter, and, alas! for his hopes, they were completely knocked on the head by the asking. Think of such an answer as this being returned him when at last he broached the subject.

"It's too bad, Miles; but did'nt you know it afore-hand? Norah left her heart behind her when she came from Ireland; she's engaged to marry some man there as soon as he can come to America."

"No! is that so. Some drunken brute of a Paddy, I'll be bound. Do, for pity's sake, break up the match, Mary. I *must* have her."

What you must *not* do, Miles, is just this. I won't have you calling Tim's countrymen names. I've heard my husband often speak of Felix Lever, and he never would consent to the match if it wasn't a good one for that young angel, as one might call her.

"Now, forgive me, Mary! If all Irishers were like Timothy Cooney, I wouldn't have had reason for speaking so disrespectfully but you know well enough what they are."

It's all the fault of the Government,' interrupted Mary.

But about this I don't promise to do anything. 'Twouldn't be right at all, at all. You wouldn't want me to say anything to her, Miles, if you were in your senses, but what man in love ever was in his right mind.

Miles turned away without answering his cousin, for his trouble was very sore. He did not really wish to make disturbance or mutiny in a prepossessed heart, but I would not affirm that he did not cause his stout back over and over again, as he wended his way back to the forge. Fortune, however, had an idea of befriending Miles Brewer, even if fate did apparently set her face against him. Every month he prospered more and more, till he became quite the model money-maker of H——, and, in the Irish democratic neighbourhood, people took a great deal of pride in proclaiming to each other that he began life and built with scarcely a cent at command.

Three years passed away and Felix and Norah were separated still and no tidings—there was little prospect of their ultimate union. The letters, which at first had been so frequent and so full, became more rare, during the last six months had not come. The lonesomeness and sorrow of exile, during the first two months by this silence of Felix, gave way to the close of the half year to a settled doubt of his truth. What was living Norah knew, for emigrant from her native country in abundance had during three months resided in the house, it was great even for a moment to harbour such a thought, but even after that thought became a bitter and settled conviction, the young girl's natural courage and strong will enabled her to bear the grief of desertion with more calmness and calmness than a colder-hearted, weaker mortal could have shown. Blest would she have been, indeed, had one word of assurance come to her in those days, that accident, sickness or poverty, had prevented his greeting; but, though the word and assurance came not, though her faith was shaken through her love returned trembling and fearful to her heart, she had no reproaches, no tears, no boisterous sorrow for other eyes and ears whatever she may have suffered was locked up within her own soul.

Believing that Norah was really deserted, and watching her calmness and indifference, Mary Cooney began to have her own thoughts as to the probabilities of her cousin's success, if he endeavoured at this time to make an impression on Norah's heart—and it was owing to her suggestions that Miles Brewer's visit to her house became quite an every day affair. And certainly, whether she regarded him as a suitor or not, there was a great deal of cordial kindness in Norah's greeting to the blacksmith, there was nothing of the coquette about her, certainly, and the gentle hearted maiden, perhaps, laid the charge of the long, long conversations she held with Miles, to an ordinary courtesy and friendliness, be that as it may, Miles, to his cousin thought that the way to her affections was now quite clear, and the lover went on with his building, and clung to his industrious habits.

The day came round when his house was finished; and his courage had arrived at the superlative degree, and that day saw the blacksmith, now a very frequent visitor at his cousin's, walking arm-in-arm with Mary, and Norah beside him, down the new street where his building stood in all its grand com-

plisteness. It was the finest shop and house in H——, decidedly. Miles was very proud of this building; he had exa great deal of calculation and thought on its arrangements, as well as money in carrying these arrangements out; and very eagerly and eloquently did he expatiate to his fair stemers on the uses and capacities of the whole place. From one room to another he led them, until at last they paused, that is, Miles and Norah, for Mary now took the opportunity to disappear to a pretty balcony leading from an upper chamber, and there, for the first time in his life, Miles Brewer spoke of love to woman. It was a twilight fitting for the tale of constant and patient love he had to tell, a sweet June twilight, so soft and warm, that it alone was enough to subdue the heart; and that story of love could not fall idly on the ear of her who listened to it.

Miles had not counted vainly on the turn affairs had taken in his favour of late—he did not have to ask for naught. Norah listened with a clear conscience to his pleading, and feeling absolved from all prior obligation, answered him as he had prayed she would. So she walked arm-in-arm home with Miles Brewer, his betrothed—and there was great joy in the household that night when they saw how the blacksmith had at last won.

An early wedding-day was appointed, and the intervening time seemed to Norah to have taken wings, when she sat down alone in the cottage the evening preceding it, to make some trifling, final preparations. Miles' house was all set in order Norah herself had helped in the furnishing; and she, with the intended husband, had arranged all the place till it looked quite "palace-like," as the mother said.

John's wife, who lived in C——, had heard a report respecting Norah's speedy marriage, and being opposed to the match, as she had been to Tim's also, and a free-spoken woman besides, she said so much, and caused such disturbance in the family, that Tim had forbidden her the house John, of course, took his wife's part, and poor Norah, who had been almost convinced by Margaret that she *was* committing and deadly sin in giving up all thought of Felix Lever, was not sorry that things had come to such a decided pass—for now she could settle with her own conscience, and compose her mind, which it was, indeed, very needful that she should do—and thus, with a prayer on her lip for poor Felix, she could listen composedly to the soft words of another.

It was while she sat alone in Tim's house, waiting and wondering how it could be that Miles and her mother, and Tim and Mary, could be so late in returning from the fair, which was held that day in a neighbouring town, that Margaret Cooney passed in the darkness to the window in the back of Tim's cottage, where, discovering that Norah was really, as a friend had told her, quite alone, she tapped at the door, and then, without any bidding, quietly walked in. Norah was vexed to see her in the village, so far from C——, at that unseasonable hour; she doubted not that her sister-in-law had come to attend the wedding, though in the full consciousness that she would be a most unwelcome guest; much surprised, therefore, was she when Margaret laid her hand on her arm, saying hurriedly and impatiently, "You must go with me."

I don't know anything about your musts," said Norah, removing herself further from her sister-in-law

"What if I've to tell you something about Felix Lever, that you've lied to so meanly? What if I tell ye he's livin' an' come over the great sea to this place, just to see the girl who is gone an' proved false to him? What if I tell ye, Norah Cooney, that he's been at the death-door with the *fraver*, on' that he's down at my house this minit, an' that I've come here for nothing on earth but to hear what ye've got to say for yourself!"

"What! Margaret, that I don't believe ye—that's all!"

"Come along, thin, yourself, an' see. No! yer afraid to come! afraid to venture to yer own brother's house, 'cause that bothering Yankee has beguiled you; more'a the pity! Come along, I say; don't be a fool outright! Oh! if ye could a' seen him cry when I told him of yees! If ye'd heard him pray that I'd come this distance to fetch ye to him, maybe ye'd not stand there looking at me as if ye was a piece of stone, and not a bit more of heart in ye, I do believe."

that ye're speaking truth, and not intending to deceive me. Swear it to me by yer hope in the Virgin, and I'll go with ye to Felix an' it were to the other end of the earth."

"Yis—if it's the last words I iver speak in this world, Felix is down there in C—— with John now, an'—there! hear thim carts! I promised to go in 'em. We haven't a minit's time. Will ye go—or wont ye?—I must be off!"

Norah never paused a moment to think of the possible results of that night's excursion. Halting only a moment at a neighbour's to tell them whither she was going, that Miles and Tim might be at rest when they heard of it, ten minutes more found her in the cart with Margaret, and on the way to C——, a distance of only sixteen miles.

It seemed rather like a tribunal of justice than anything else (to both those women as they went their way) to which they were rapidly speeding—and Margaret's eye was as constantly fixed on her companion as though she had, indeed, the conduct of a prisoner in her charge.

. . . . . .

Before nine o'clock the next morning there was a great tumult in the house where John Cooney lived—a greater excitement prevailed there when Norah entered it in the night time, and fell fainting, and with a heart breaking almost with the weight of its recovered love, and sorrow, and repentance; wilder than when in that still hour poor Felix listened to her confession, and clasped her to his breast, and pleaded where no pleading was needed to convince, his sickness and poverty, and *his* trust in *her*.

Tim and Mary and Miles Brewer were there; fearful of much, they scarcely knew *what*, however, from the extraordinary circumstances of her nocturnal departure, they had started in the first morning train for C——, and there they were all gathered together, astonished, enraged, and far from speechless. The prosperous Miles was a striking contrast, indeed, to the poor, pale, ill-dressed, and almost despairing Irishman; he looked, too, handsomer now in his wrath than r before, and noisily, and with a great and quite apparent consciousness of his superiority to the whole group, did he argue the point, that this was his marriage-day, and he'd not put up with such a low performance; Norah Cooney was his by promise, and his she should be.

They all talked, but to no purpose, till the brothers and Mary finally reasoned Miles into quiet, when Tim said,

"It's agreed now, ye'll all lave it with Norah. It's a bad business, we all know—and we're sorry it happened. Felix here is almost like a brother to us; and Miles Brewer is a man to be proud of for any woman in the land. But we'll lave it to her. This is your wedding-day, Norah Cooney—which man shall be your husband?"

There was a deep silence in the little room, when he finished his speech, and it was many minutes before Norah lifted her head and spoke. But she had strength at last, and she said, so solemnly, that her hearers were awe-struck,

"If I'd died afore this day 't would have been a happy thing; but I'm punished for thinking falsely of Felix Lever. I gave him my heart. I had n't the right to take it back without he gave me the leave. Miles, I knew him from the time when I was a child; I promised myself to him afore I knew ye was in the world. Oh!—oh forgive me! I can't be false to him now! If he'd take me back to his heart, and thrue, kind thought, I'd be richer nor if I had all the gold in the world. He's of my own country; and, God forgive me! I'd not lave him now for any other, though ye would a' done great things for me; and you are a noble man, Miles Brewer, a better man than I deserve to marry."

A wild struggle went on in the heart of Miles as he listened to that low-spoken, solemn confession; but his excellent generosity conquered every other emotion as she ceased speaking. He came forward, then, and leading Felix from the corner where he stood, weak and irresolute in his grief and his love, to whom Norah was, he joined their hands together—but his voice was not clear, nor were his eyes quite dry, as he said,

"God has joined—man shall not sleave asunder. Norah, I don't love you the less that I freely give you to him now; but you love him better than me—and it's right you should marry. Boy, I wish you a happy life with her."

PROJECT FOR AN ELECTRIC TELEGRAPH FROM EUROPE TO AMERICA BY WAY OF ICELAND

SUBMARINE TELEGRAPH BETWEEN EUROPE AND AMERICA

THREE hundred years ago there were no turnpike roads in England, and the only mode of travelling expeditiously was the mode equestrian. London, in the reign of Elizabeth, was so badly paved and miserably lighted, that the favourite, and, indeed, only comfortable way of passing from the City to the West End, was by the river, either by night or day. And thus the "silent highway" came to be, for years afterwards, the chief scene of metropolitan traffic. Even within the memory of living men the journey from London to Edinburgh was a matter of such serious import, as to occupy three days, and the voyage from England to New York was considered a quick one if accomplished in six months. Now, however, things have changed mightily; within the last twenty years steam has made itself paramount, and the magnetic wire carries instantaneous messages from one end of the country to the other. The journey from the capital of England to the far north of Scotland is made between the rising and the setting of the sun, and the trip to America is considered rather slow if the steam-ship between Liverpool and New York is above ten days on the passage; nay more than that, the English Channel has been if not exactly bridged, at least made a medium of communication between our tight little island and the continent of Europe. We have already spoken at some length—*at page 70*—of the history of the Submarine Telegraph. Of its influence in producing a better understanding between nations, and solidifying the peace of Europe there can be but little question. The gutta percha covered wire lying at the bottom of the sea is as it were the cordon of intelligence and the coil of enterprise, destined to carry forward the civilisation of all peoples.

The entire success of this first experiment has naturally caused many to speculate on the further extension of the telegraphic system, and thus we find that it is only will England and Ireland be united by a submarine wire, but that it is proposed to carry a telegraph wire across the Atlantic Ocean even to the shores of the great American Continent itself.

The particulars of the proposition, which may be called great in more senses than one, are by no means complicated. The plan by which the Atlantic is to be spanned, and the old world united to the new, will be seen at once by a glance at the engraving. Having ascertained the best points on either side to which the telegraphic wire could be attached, M. Dumoulin proposes that a rope similar to that between Calais and the South Foreland should be extended completely across the Atlantic Ocean. Instead however, of letting the rope fall to the bottom of the sea, as is the case with the present Submarine Telegraph, he thinks that it should be suspended by buoys placed at certain determinate distances apart—say thirty feet—and allowed to sink in the water more than forty feet at its lowest point of deflection. At that depth the water is ascertained to be perfectly still whatever the state of the weather. This system of suspension will be perfectly understood by reference to the letters in the engraving. A, B, C, are the fixed buoys to which the rope is attached by means of the iron braces A D, B E, and C F. And in this way the telegraphic wires could be carried from buoy to buoy till the entire distance was accomplished.

The manner of constructing the rope is not essentially different from that already adopted—namely, that of a series of electric copper wires insulated in gutta percha, prepared yarn, and

from. In the long letter which M. Dumont, the of this grand scheme, addresses to the world the medium of the *Illustration*, he enters fully into particulars of his scheme, and shows how all objections may be met, and all difficulties of wind and tide may be overcome; and so great is his faith in the eventual success of his project, he goes not only into the probabilities of the case, but seems attempts to show how such a plan would prove as a commercial speculation He is a wise king before he goes to battle, sits down to count the cost to contemplate for an instant the effect of a Submarine between London and New York We have already the speech of our gracious Queen can be put into the President of France within an hour of its de the House of Lords I may, then, a message from a in the City traverse the breadth of England fr and the great Atlantic Ocean and bring delivered is to his correspondent in New York Potsdam, or Phila dia, in about the same time as one take to eat his dinner or walk half a dozen miles! The mind fails to comprehend the greatness of the undertaking, and we begin to despair of its accomplishment But when we recollect that many doubted the success of steamboats, and disbelieved in railroads which we call to mind that some things we use daily in our houses and our shops—the watch, the clock the gas lamp, for instance—were puzzles and mysteries to the who lived before us, when we look around us and perceive that every day is bringing forth new discoveries in art and science—in many a system of mnemonics, again, a special agency in physic—in a discovery, which in part explains away the mysteries of superstition and romance, which we call up all these and compare them with the knowledge possessed by even the wisest of our forefathers, we begin to have faith in the realization of a scheme which would be nothing less than an epoch in human history than the discovery of electricity itself

* Odyssey — Sharpe

ABD-EL-KADER AN AUTHOR

ABD-EL-KADER has become an author The wild son of the desert, now that the sword has been wrested from his hand has taken up the pen It is no uncommon thing for the man of right strokes to be the man of powerful words Napoleon and words in him like Austerlitz battles In compliance with the request of a French general Abd el Kader has employed some of his time, in the captivity in which, to the shame of La belle France he is still kept in giving a very interesting account of the Arab horses of the desert in which he describes the number of days they can march with fatigue, the distance they can accomplish in a day, their power of enduring hunger and thirst the manner of breeding feeding, and training them, together with other curious and interesting matter, of which the following is a specimen

"Although all the horses of Algeria are Arab by race many have fallen from their nobility because they have been too often employed to plough, to carry and to draw burdens and in such labours, which is a thing never done amongst the Arab of old. At this point our Arabs say it is enough for a horse to wall on a ploughed field in order to lose all its merit, and they tell the following story. 'A man was riding on a thorough bred horse He was met by his enemy, who was also mounted on a noble courser Then pursued the other, and he who gave chase was distanced by him who fled. Despairing to overtake him, he cried, 'I ask you in the name of God, has your horse ever been at plough? He has been at plough during four days' 'Well' mine has never ploughed; and by the head of the prophet I am sure of catching you!' The fugitive continued his chase. Towards the end of the day Ben-Aïssa began to lose ground, and the pursuer to gain it, and at last he succeeded in combatting him whom he had at first despaired of overtaking. My own father, may God have pity on him, was accustomed to say, 'There has been no blessing on our land since we have made our horses beasts of burden and of the plough. Did not God make the horse for the course, the ox for the plough, and the camel to carry burdens? There is nothing to be gained in changing the ways of God!'"

SMILE UPON THE FALLEN.

Oh! smile upon the fallen!
It perhaps may heal a smart;
It may cause a flow of gladness,
To warm the frozen heart;
And cause a gloom to change into
A smile of other years,
When everything was happiness,
And all unknown were tears.

Oh! smile upon the fallen!—
Think not because 'tis so,
That in their hearts no feelings live,
No sweet affections flow,
Think not because their deeds were dark
Grim feelings haunt them still;
Remember thou repentance true
The darkest heart may fill

Oh! smile upon the fallen!—
The heart that's suffer'd scorn
Though crush'd has tender impulses;
Though trampled on may own
Rare gems as bright as ever lived
In hearts that ne'er have known
The pangs the pains the hopeless hours,
The fallen one may own

Oh smile upon the fallen —
Look kindly in their face
There are plenty who can frown on them
But few the smiles they trace
Why then should'st thou thy grim look add
When thou a smile may'st use
A smile which may into their hearts
A ray of hope infuse

Oh! smile upon the fallen
Who knows but from above
The angels may be looking on
With smiles of happy love?
And then perchance the fallen one
May offer up a prayer
That Heaven may bless thee in thy plans
And send thy life be fair

Oh smile upon the fallen!—
Remember drooping flowers
Do raise their heads when suns do smile
And nourished by kind showers
Then smile upon the fallen one —
It perhaps may heal a smart
It may cause a flow of gladness
To warm the frozen heart

LITERARY NOTICES

THE FREEHOLDER AND COMMERCIAL ADVERTISER *a New Political Independent Paper, will be published every Wednesday, at 4d per quarter—On Monday, March 1,*

It will be published as a Weekly Newspaper, THE FREEHOLDER AND COMMERCIAL ADVERTISER *As its name indicates, it will, in the first place, be one of the Great Freehold Land Movement In addition to its principles will be illustrated with engraved Plans of Estates and various Societies a weekly list of the prices of the different Societies the improved value of allotments the prices at which allotments have been sold different estates notices of Building, Life Insurance and other Societies for the promotion and encouragement of provident habits &c But to these and similar topics will have due space—*

*II—*THE FREEHOLDER AND COMMERCIAL ADVERTISER *will form a complete guide on the occupation of allotments, whether by building or for gardening or other agricultural purposes*

III—As a Commercial *Paper, it will prove to be one of great importance and value to the trading community, not only as it will present a faithful record of the commercial o as all the Monday's Markets up to the time of going to press*

IV—Although THE FREEHOLDER AND COMMERCIAL ADVERTISER *will be the Organ of the Freehold Land Movement, it will be a first-rate general Newspaper, independent in principle and will exert itself to the utmost to bring the Election Freeholder within the reach of every industrious and virtuous citizen*

Order of any Newsvender THE FREEHOLDER AND COMMERCIAL ADVERTISER.—*Office, 335, Strand.*

MISCELLANEA.

If history be philosophy teaching by example, the skilfully constructed fiction is no less so, nay, being more familiar and domestic, its lessons come more nearly home to the heart; and those who cannot entertain a sympathy for monarchs, heroes, and legislators, readily participate in all the woes and triumphs of individuals moving in their own sphere, and subject to the same casualties which they have themselves experienced. No wonder, then, that this species of literature is so popular

WELLINGTON AT WATERLOO.—Creevy was at Brussels during the battle of Waterloo The suspense all that day was intolerable, the rumours were all unfavourable, and the non-appearance of our army in retreat on Brussels offered the only faint object of hope. Early the next morning Creevy went to see the Duke of Wellington, who had returned in the night "The duke rejected all congratulation, and said it was a dreadful business thirty thousand men destroyed It was a d——d near thing, Blucher and I thought we could do it, but it was a d——d near thing" Here was no vanity—no boasting

It is astonishing how chilling the words of age fall upon the glowing enthusiasm of youth As we go on through life, doubtless we gather all the same cold truth it is by degrees, not all at once, as when the freezing experience of many years is poured forth, like a sudden fall of snow upon our hearts Lucky, most lucky, that we cannot believe the lesson which the old would teach us, for certainly if we were as wise when we come into life as when we go out of it there would be nothing great and very little good done in the world we mean that there would be no enthusiasm of wish or of endeavour

VALUE OF A WIG —The following story is related of Count La Borde When among the Arabs, he saw a very fine mare which he wished to purchase, while the bargain was going on (another was bargaining, he not speaking Arabic), hearing a talk, the Arabs thronged round and jostled him rather rudely He drew his sword, as quick as his ready steel flashed came forward the rummah and cobba of the Arabs, he was borne back by numbers burning with rage he plucked his head dress (oh, shade of the undauteous sun, his wig and all came too), and he cast it amidst the crowd. They fell back in terror from this man of wondrous make—"*Ya wallah*, the Kaffir has pulled his head off, God help us, God pardon us" This gave time to appease all anger; the Count replaced his wig, which had proved to him a better defence than the triple shield of Ajax, or the petrifying head of Medusa B—— Back-bish, and all was forgotten

EDUCATION BEGINS WITH LIFE — Before we are are aware, the foundations of the character are laid, and no subsequent instruction can remove or alter them. Linnæus was the son of a poor Swedish clergyman. His father had a little flower garden in which he cultivated all the flowers which his means or his taste could select. Into his flower garden he introduced his little son from infancy, and this little garden undoubtedly created that taste in this child which afterwards made him the first botanist and naturalist of his age, if not of his race.

"Is that clean butter?" asked a [illegible] of a boy [illegible] market.

replied the [illegible] "for mam and Sal were more than two hours picking the hairs out of it last night"

SEARCH AFTER HAPPINESS —If you cannot be happy in one way be happy in another, and this faculty of disposition wants but little aid from philosophy, for health and good humour are almost the whole affair Many run about after felicity, like an absent man looking for his hat while it is on his head or in his hand

THE NEWSPAPER PRESS. There are ten daily papers published in London of an aggregate circulation of 6 000 while in New York only one quarter there are 12 with an aggregate circulation of 1 000 Of the New York papers 60 000 are sold in the city of which [illegible] distributed over the country Of the London papers [illegible] are sold [illegible] and second day The [illegible] of [illegible] disproportion between [illegible] consumption of the [illegible] The [illegible] each [illegible] paper [illegible] are sold at [illegible] New York [illegible] sold [illegible] and the other [illegible] of Middlesex [illegible] obtain [illegible] in the journals of the two counties [illegible] [illegible] and [illegible] The virtual monopoly enjoyed by the [illegible] (the representative of much [illegible] county or [illegible] has no parallel in France or America where every man can [illegible] journal in any [illegible] life to his opinion and [illegible] The total number of stamps issued to the [illegible] —Metropolitan [illegible] 21 079 [illegible] 1 000 9 074 Wales 611 252 Scotland [illegible] Ireland 1 000 501 total 7 063 251 or on an average 2 to a person The average of England and Wales is 7 for England 2 and for Ireland 0 93 or not quite one for each person If the support of the newspaper press be as much as the tax of one penny on each journal would be the most intelligent Scotland next and Ireland last This tax however, cannot be allowed The cost of [illegible] on newspaper [illegible] which added [illegible] £1,650 011 12 1d in Great Britain Of the London weekly papers, the cheapest papers average 110 671 class papers (*Bell's Life in London* and *Era*) 13 37, Church of England papers 973 Wesleyan, 1 998 Dissenting 11 47 Roman Catholic 4,666 other newspapers included under the above head 111 total 80 146 Were the whole number to remain in London every family would have its weekly paper The cheap papers owe their immense circulation almost entirely to their cheapness and they have fetched down the sale of their higher priced and better conducted rivals amazingly thus the *Weekly Dispatch* printed 471 and the *Sunday Times* 257 000 stamps in 1830 the number in 1836 It is remarkable that the English Church and the several sections of Nonconformity should support collectively only eleven papers devoted to their interests, and, with one exception, it is barely supporting A whatever department of the newspaper press we look, we find an amazing disparity between the number of papers circulated and the numerical state of the class they represent, and that disparity can be attributed only to the system of which the penny stamp appears to be the most obnoxious feature

FAST ENOUGH FOR A SHILLING.—A gentleman from Leeds, when in London, recently asked a cabman how much he would charge for conveying him to a certain place [illegible] spence," was the reply The [illegible] the [illegible] charge was one shilling, and confident as the result of that knowledge, [illegible] into the cab, telling the driver he would pay no more than the latter sum With a look that plainly indicated that the genius of the whip thought his customer "no gentleman," he drove on his vehicle in the required direction, but at a pace so slow that the gentleman inside lost all patience, and putting his head out of the window inquired what he could not be driven faster "Why [illegible] and the cabman, slightly turning his head and looking over his shoulder at it is fast enough for a shilling', I think [illegible]

A YANKEE DESCRIPTION —A writer in *Yankee* describing the eloquence of one Rufus Choate, says—"He [illegible] commence like an eagle soaring from his eyrie and continue it onward and upward higher and higher on the mountain-tops, up higher and higher till, and still higher, until he became the companion of the cloud Often when he finished a period in his happiest and most thrilling style, the listener would involuntarily look up to see if the thunderbolt he had launched from his lips had not penetrated the roof of the hall What wonderful men and things do America produce!

FACETIÆ POLITENESS —A good story is told of a very polite sheriff, who came on some time outdoor by a person it was the [illegible] of his duty to hang 'Sir,' said the gentleman in the [illegible] was carefully adjusting the rope really your attention deserves my thanks In fact, I do not know of one I should rather have hang me Really, said the sheriff, "you are pleased to be complimentary I do not know of another individual it would give me much pleasure to hang"

VISIBILITY OF THE AIR —An interesting paper by M Andraud the engineer, who is so well known to the public by his experiment with compressed air as a substitute for steam on railways, was presented to the last sitting of the Academy of Science This paper is entitled by the author Aeroscopie, or the visibility of the molecules of the air M Andraud proves that by a very simple contrivance the air is rendered visible By taking a piece of card coloured black, and piercing it in the centre with a fine needle, this [illegible] fact is established If we look [illegible] this hole at the sky on a fine day, [illegible] having a ground-glass, we see a multitude of little transparent globes moving in the midst of confused nebulosities These little globes, some of which are more transparent than others, are molecules of air Some of them are surrounded with a kind of halo These latter, says M Andraud, are the elements of oxygen, while others are the elements of azote. After continuing the observation for a time we shall see small points [illegible] themselves, and disappear infalling. They says M Andraud, are [illegible] of the This phenomenon of vision, it is [illegible] to remark, passes within the eye itself; the molecules of air which are observed are those which float in the liquid which occupies the anterior part of that organ. According to the author of this paper, the discovery is not [illegible] phenomenon, but may [illegible] portant purposes in [illegible]

MAN.—Every man is greatly ... ; for he who possesses the divine ... of a soul is a great being, let his ... in society what it may. He may be ... the most business—may make no show—be ... scarcely known to exist—but yet he may ... more truly great than those who are ... universally so called; for greatness consists ... force of soul—that is, in the force of ... its moral principle and love, and ... may be found in the humblest condi... The greatest man is he who ... right with the most invincible ... who resists the sorest tempta... from within and without—who ... the heaviest burdens cheerfully—... is calmest in storms and most fear... under menaces and frowns—whose ... on truth, on virtue, and on God, ... unfaltering

KEEP COOL.—We are one of those who love a joyful face. If there is anything of which we may be prodigal without cost or prejudice to ourselves, but with a great deal of benefit to others, it is of our smiles. Smiles are contagious, and so are their opposites, gloomy and unpleasant looks. Do try, each and every one, to carry a cheerful face. What if our path be beset with perplexities—don't mind. There's no use in fretting, though you are in debt, and business is dull, and the banks will not discount, and your friends can't lend. Getting vexed with yourself and everybody else won't help the matter—no, not a bit. If the girl you adore gives you the mittens, or you have got married, and find yourself egregiously taken in, keep cool—fretting won't bring back the one, or make an angel of the other. If your trunk is lost in travelling, or some pickpocket relieves you of your superfluous bank-bills, take it easy—fretting won't afford any consolation for your troubles. Keep cool, then, and not needlessly worried.

GOOD AND BAD NEWS.—Bad news ... the action of the heart, oppress ... lungs, destroy the appetite, stop the ... digestion, and partially suspend all the ... functions of the system. An emotion of ... shame flushes the face, fear blanches, joy ... illuminates it and an instant thrill elec... trifies a million of nerves. Surprise spurs ... the pulse into a gallop. Delirium imparts ... great energy. Volition commands, and ... hundreds of muscles spring to execute ... powerful emotions often kill the body at a ... stroke. Gallo, Diagoras, and Sophocles, ... died of joy at the Grecian games. The ... news of a defeat killed Philip V. One of ... the Popes died of an emotion of the lu... dicrous on seeing his monkey robed in ... pontificals, and occupying the chair of ... state. Muley Moloc was carried upon the ... field of battle in the last stages of an in... curable disease, upon seeing his army give ... way, he rallied his panic-stricken troops, ... rallied back the tide of battle, shouted vic... tory, and died. The door-keeper of Con... gress expired on hearing of the surrender ... of Cornwallis. Eminent public speakers ... have often died in the midst of an impas... sioned burst of eloquence, or when the deep ... emotion that overpowered it had suddenly sub... sided. Ampere, the young Parisian, died ... when he heard that the musical prize for ... which he had competed was adjudged to ... another. The case of Hill, in New York, ... is among the memory of all; he was ap... prehended for theft, taken before the po... lice, and, although in perfect health, mental ... agony forced the blood from his nostrils.

ANSWERS TO CORRESPONDENTS.

A TRIFLING STUDENT.—You will find what you want in Morewood's "History of Inebriating Liquors and Distillations."

J. F.—The History of England will not be published in THE WORKING MAN'S FRIEND, as there is already one written expressly for the "Working Man's Library." It is by Dr Fergusson, and has already gained great praise and had an enormous sale.

THOMAS ATBURY.—The FREEHOLDER newspaper will appear on the 1st of March, and be continued weekly. It will contain Monday's corn and other markets.

A CONSTANT READER.—Scotland belongs to Europe. It was known to Europe before America. It belongs to an European monarch. Its literature is European. It has nothing whatever to do with America.

X Y Z says "Having to write a dissay upon the Persecuted Nonconformists and the Revolution of 1688, I shall feel obliged if you will advise me what books to read for the purpose." If X Y Z has mixed up the two questions, we think he has done wrong. The subject, both are put in enough at a time. The materials for the Puritan tiful enough. Neal's "History of Price's "History of Nonconformity," Hanbury's "Memorials of Independency," Hall's "Story's "Steps of our Forefathers" will give him what he wants for his essay on the Persecuted Nonconformists. The other essays must be written after consulting Hallam, Macaulay, Mackintosh, and Professor Smythe's "Lectures on Modern History," where he will get reference to all that is worth reading on the subject.

A SUBSCRIBER FROM THE BEGINNING wishes to get rid of superfluous hairs. There is but no way—pluck them out.

J I.—A landlord has no right to stop a footpath which has been in existence more than a hundred years. We dare say your question was overlooked, but we must beg your patience and that of the rest of our correspondents. They must give us time.

BENJAMIN LONG.—We can make no promise till we have seen the manuscript. You are aware the subject is of mere local interest, unless it be very pleasantly and powerfully handled, but we can say nothing about it until we have seen it.

I B asks the amount of scholarship necessary to enter a young man eligible for the situation of bankers clerk? Very little we imagine. A little skill in arithmetic and the ability to write a good hand.

AN OLD SUBSCRIBER.—There is not the slightest prospect of discontinuing THE WORKING MAN'S FRIEND. The volume will be completed in 26 parts, but the publication itself will go on as usual.

A GRATEFUL INQUIRER wants to know the process of naturalisation in France. We refer him to Lord Brougham. One thing is clear, that to be naturalised in France he must cease to be an English citizen. But, unless he has any particular reasons, we recommend him not to apply for naturalisation in France at present. Let him wait and see what Louis Napoleon is about.

A WORKING MAN.—You may purchase a camera obscura at any philosophical instrument maker's, but we cannot tell you the price, as you may get them at all prices.

AN ECONOMIST.—There are books published professing to show how a man may live in London on £50 a year, but you can find out for yourself how cheaply you can live far better than any book can.

A Z wishes to know the best guide to the continent of Europe. There is no one volume we can recommend. A Z must procure Murray's Guide-books. They may be depended upon. A. Z.'s next question is very difficult to answer. We really cannot name the *least* sum a person *must* spend in travelling over Europe. Travelling is an expensive pleasure, and the more money one has to spend when travelling, the more agreeable the journey is. In the north of Europe one may travel, we believe, more cheaply than elsewhere; but it is impossible to name a sum as the probable expense of a ramble through Europe. A. Z. must get Murray's Guide-books and form ...

E. M. C.—The best side for warts is burning them off with caustic.

W. W.—You had better take the advice of some *respectable* solicitor; but mind what you are about, or you may be robbed right and left.

PHONE wants to know if he may use a shower-bath immediately after a warm bath? We say, Try. If it agrees with him, Phone will soon find it out.

M. M. wants to know what we pay contributors to our pages? We have no fixed scale of remuneration. Some contributions would be dear at any price.

A WORKING MAN.—THE FREEHOLDER AND COMMERCIAL ADVERTISER will be a family man's newspaper. It will not merely be the organ of the Freehold Land Movement. It will be popular in its tone and character. Everything relating to the people's progress will be given. It will aim to instruct, and elevate, and guide the million.

J W. misunderstands the drift of our article on pernicious literature. Study by all means the lives of bad men as well as good. You may learn from the one as well as from the other. We only protest against putting into the hands of the young before their principles are established—when, in the language of the poet, they are wax to receive and marble to retain,—works holding up to admiration and imitation the vicious and deprived. This is very different to the knowledge of evil which necessity in land upon us to acquire. J W, we think, will see his mistake.

R. BUCHANAN.—Paine's gas is not portable.

A CONSTANT READER.—Forestalling, as an offence at common law, is described, in a statute of Edward VI, to be buying or contracting for any merchandise or victual coming the way to market, or dissuading persons from bringing their goods or provisions there, or persuading them to enhance the price when there. This offence was abolished by 7 and 8 Vic, c 24, entitled "An act for abolishing the offences of forestalling, regulating, and engrossing, and for repealing certain offences passed in restraint of trade."

S D.—We are not aware that there is any demand for plate-layers in Australia, but there is a great demand there for labour at this time, in consequence of the settlers abandoning their occupations and marching off to the "diggings."

T. W asks what tartar on the teeth arises from? We take the answer from a medical work just published by Mr Canton. He says "From the want of proper attention to cleanliness, more especially in persons the secretions of whose mouths are in a vitiated condition, a smaller or larger proportion of the salts held in solution in the saliva, with other extraneous matter, such as, according to Maude and other microscopic observers, infusorial animalcules and their skeletons, are deposited on the teeth, whether natural or artificial, and, when so precipitated, are commonly called tartar, or by some a salivary calculus, or secretion." Persons suffering from fever, or salivation, whether arising from constitutional causes or from the exhibition of medicines, and those whose digestive apparatus in any part is out of order, are peculiarly liable to this secretion, but it may be met with in all states of health and at all ages.

TEXTOR (Dedsborough).—The letters V D M after the name of Matthew Henry, and other preachers, stand for *Verbum Dei Minister*, Minister of the Word of God.

JOHN GREGORY.—The "dead languages" are languages that have ceased to be spoken, as Latin, &c. The Latin names of the months are as follow: Januarius, Februarius, Martius, Aprilis, Maius, Junius, Julius, Augustus, September, October, November, December.

J S (Frome) thinks there is no effectual remedy for the plague of bugs but using the bedstead itself as the most suitable trap for them, and taking it to pieces and cleansing it thoroughly two or three times in a season. He says that all lotions and ointments, however powerful, will only keep them from the bedstead for a short period, and that meantime they take refuge in the walls, &c.

SKILL AND INDUSTRY.

UNITED, they are strong and powerful; divided, they are weak and powerless. The first may be deemed as the head, and the last as the hands; the one invents, adapts, controls, improves, digests—the other carries into effect and operation. Twin sisters, as the artist has delineated them, they together do the work of the world; separated, they effect nothing. Skill without Industry is as a chained prisoner in an impenetrable tower. Industry without Skill is as a ship on a stormy sea, without a rudder or a hand to guide. Or they may be likened to a master and a servant—the one commands, the other obeys, or to an engine and its driver—one possessing power alone, and the other will to guide that power onwards whithersoever he pleases. Skill is the mainspring which, in its efforts to escape control, unwinds itself, and so sets the wheels of Industry in motion. Skill is the overseer, Industry the labourer, the one cannot act without the other, and neither are independent. Skill is the teacher, Industry the scholar, Skill is the maker, Industry the seller, Skill is the poet, Industry the workman; Skill is the brain, Industry the thews and muscles, Skill theorises, Industry practises, Skill is the monarch, and Industry his willing subject.

How, happy, then, is the condition of him in whom the qualities of skill and industry are united. But it must not be supposed that these inestimable gifts—better than genius, because more certain of appreciation, and more adaptable to the wants and wishes of mankind—are the property of any one class or section of men. Among the rich and educated, Skill takes the form of a statesman, a lawyer, a divine, a teacher, to whom Industry is the faithful handmaid; among other classes it comes in the guise of the workman anxious to understand and conquer the principles of his work, whatsoever it be. With these, Skill and Industry united, form honourable labour, and that labour, rightly directed, is honourable, there can be no question, be the workman whomsoever he may.

A GROUP IN BRONZE, BY JOSEPH GAFFIL, VIENNA.

The rich, in his father, his friend or himself,
By head or by hand must have toiled;
And the brow that is canopied over with pelf,
By labour's own sweat has been soiled.

Let us illustrate our meaning by a little fable.

Once upon a time, there dwelt a poor man in the depths of a forest, who earned his bread by felling trees. And he worked very hard indeed, and it was only by great efforts that he was enabled to procure subsistence for himself and his family. All day long through the bright summer days, and in the midst of the cold dreary winter, the sound of his axe might be heard re-echoing through the solitary woods. And he was known to all the country round as Old Industry. His family was one of the most ancient in the world, and he could have traced his genealogy (if he had known anything of that noble science, which he did not) right back to Adam, the first worker. And so, from youth to manhood, and from manhood to old age, he had gone on just as his father had done before him, hewing down the giant trees of the forest and by great labour dragging them to the edge of the river, on which, with much more labour, he contrived to launch them, so that they might float down to the distant town, where they were sold to make houses and ships. Now, it happened that one day, while Old Industry was thus employed, a young stranger, of fair and noble aspect, came into the wood, and stood and watched the labourer at his work—at rather disconcerted the old fellow at first to see the stranger looking on, especially as he came day after day and gazed curiously at his operations without conversing, or even so much as saying "God be with you" when he came or went. So the old man

AN AMERICAN HEROINE.

THERE are many incidents recorded in the history of the American Revolution, in which acts have been achieved, and courage of the most daring character displayed, by females, which would have done honour to the stronger sex, but in the life and character of the extraordinary woman before us, history is without parallel.

Like Joan d'Arc, we find an humble girl of seventeen inspired with an ardent patriotism and resolution to stand forth in the defence of her injured country, offering her services in the garb of a *continental soldier*, determined to aid in the struggle for freedom, or to perish a noble sacrifice in the attempt

Deborah Sampson was born at Plympton, a small village in the county of Plymouth, Massachusetts, on the 17th of December, 1760 She was the granddaughter, by the maternal side, of William Bradford, for many years Governor of the Colony of Plymouth.

At the time of the marriage of Deborah Sampson's parents, her father was a respectable farmer, but through losses and misfortune he became so reduced as to be induced to make trial of a seafaring life, and having made one voyage to Europe which proved to be tolerably successful, he started on a second, but alas! it proved to be his last, the vessel was wrecked, and Mr Sampson with several others were lost

The mother of our heroine, by her industry and economical management, kept her family together as long as she was able, after her husband's decease, but sickness and other misfortunes obliged her to give the children into the hands of kind friends who had offered to take charge of them

Deborah was only five years old when she was adopted into the family of a lady of the name of Fuller, who promised to take charge of her education

She had not been more than three years in her new home, when, to her great sorrow, she lost her benefactress by the epidemic then raging, the small-pox Her mother now removed her into the family of Mr Jeremiah Thomas, of the same town The lady of Mr. Thomas perceiving in Deborah a great propensity for reading and study, gave her every opportunity to indulge in it. She remained in that benevolent family until she attained her sixteenth year, when she was released from her indentures, and became her own mistress. She then engaged herself to work in the family of a farmer one half the time, in payment for her board and lodging, the remainder was spent in school.

In a very few months she was regarded as a prodigy, her proficiency being so rapid.

She was notorious for her frequent interrogatories relative to natural history, especially the cultivation of plants, which became conspicuous in her early years, and which, from the delicate effect it frequently has on many of the softer passions, induces us to notice it here. This appears to have been the case with her inquiring mind, she has often been heard to express her astonishment when she has found one of her companions most anxiously perusing some novel or romance formed on some love-story. She has often said that her mind was never more effectually impressed with the power, wisdom, and beneficence of Deity, than in the contemplation of his works These traits, we may venture to affirm, are some of the primeval exertions of those endowments which are so peculiarly characteristic of rectitude and worth, the leading principles of life.

The operation of affairs in the colonies at this time began to wear a gloomy aspect, not only affecting the minds of men, but appearing most sensibly to interest the females Deborah Sampson never passed a day without inquiring the state of affairs, and seemed to enter into those inquiries with a spirit of indignation and astonishment

[illegible] of the inhabitants of Massachusetts, and particularly those of Boston, after the passing of the Port Bill, can better be imagined than described Deborah, though not an eye witness of this distress, was not insensible to it, her mother and sisters were residing there, and she was continually hearing of the unprovoked insults of the inhabitants by the enemy, and the probability of their soon being in a starving condition These startling relations filled her patriotic soul with an enthusiasm which strengthened and increased with the ment of the object after which she aspired. She had frequent opportunities of viewing the American volunteers as they marched from one post to another; every time added additional stimulus to her determination; and the time had now arrived to carry into execution those plans which had long been maturing in her chivalric mind. During her residence at the farm, her employer permitted her to keep a few chickens, from which indulgence she had saved a few dollars.

She now determined with that small sum to purchase some material which she could convert into a suit of male attire; and

dingly procured some fustian, and when secure from observation made it up into clothing suitable for her purpose; as each article was finished she hid it in some secure place till the whole was accomplished.

She then made known to her employer that she was going where she could be better paid for her labour, and, tying her new apparel in a bundle, left the house to enter upon a new and to her a most hazardous enterprise.

On the morning of her departure from the farmhouse, she rose before the sun, and retiring to the shelter of the nearest wood, assumed the garb in which she dared the most dangerous exploits. She took her course towards Taunton, in hopes of meeting with some one who was going directly to head-quarters She reached Taunton soon after six o'clock the same morning, and the first person she unwelcomely met was a near neighbour of her late employer This was at first like an electric shock to her, but he passed on and did not recognise her. She proceeded on to Bellingham, knowing there was a recruiting party there, and engaged herself as a continental soldier during the war The general muster-master was doubtless glad to enroll the name of a youth whose looks and mien promised to do honour to the cause in which he was engaged.

She entered her name as Robert Shurtliffe, and became one of a party who were ordered to Worcester, to join the company of Captain Thayer of the Uxbridge regiment, to which she then belonged.

The fair authoress relates an incident which occurred during her stay at Worcester, which will not be out of place in this nar

She says —"The regiment not being ready to depart, and Captain Thayer being much pleased with the appearance of his new recruit, gave him a home in his family While in the house of Captain Thayer, a young girl, visiting his wife, was much in the society of the young soldier. Coquettish by nature, and perhaps priding herself on the conquest of the bloom-

she suffered her growing partiality to be perceived Robert on his part felt a curiosity to learn by new experien how soon a maiden's fancy might be won, and had no scruples in paying attentions to one so volatile and fond of flirtation, with whom it was not probable the impression would be lasting This little piece of romance gave some uneasiness to the worthy Mrs Thayer, who could not help observing that the liking of her fair visitor for Robert was not fully reciprocated. She took an opportunity of remonstrating with the young soldier, and showed what unhappiness might be the consequence of such folly, and how unworthy it was of a brave man to trifle with

feelings of a girl The caution was taken in good part, and it is not known whether the courtship was continued, though Robert received at parting some tokens of remembrance, which were treasured as relics in after years"

The company being ready they were ordered to West Point, to be detached into their proper companies and regiments. It fell to the lot of Robert to be in Captain Webb's company of light infantry, in Colonel Shephard's regiment, and in General Patterson's brigade. On the second day after their arrival they drew their accoutrements, which were a French fusee, a knapsack, a cartridge-box, and thirty cartridges Her next business was to clean her piece, and to exercise once every morning in the drill, and at four o'clock P.M., on the grand parade. Her garb was exchanged for a uniform peculiar to the infantry of those times, it consisted of a blue coat, lined with white, and white wings on the shoulders, and cords on the arms and pockets, a white waistcoat, breeches or overalls and stockings, with black straps about the knees, half-boots, a black velvet stock, and a cap, with a variegated cockade on one side, a plume tipped with red on the other, and a white sash about the

The martial apparatus, exclusive of those in marches, was a gun and bayonet, a cartridge-box, with white belts. They did not remain long at West Point before they received orders to join another part of the army then lying at Harlæm near New York. As the infantry belonged to the rangers, a great part of their business was scouting, which they followed in places most likely of success.

After remaining at Harlæm but a few days, they were ordered to White Plains, where they, in turn, kept the lines, and had a number of small skirmishes, but nothing uncommon occurred at either of those places.

Early in July, Captain Webb's company being on scout in the morning, and headed by Ensign Town, came up with a party of Dutch cavalry from General Delancy's corps, then in Morrisiana They were armed with carbines and broad-swords. The action ...menced on their side. The Americans withstood two fires before they had orders to retaliate. The ground was warmly contested for a considerable time, at length the infantry were obliged to give way till a reinforcement arrived, when the enemy made a hasty retreat. Our fair soldier says she suffered more from the intense heat of the day than from the fear of being killed, although a soldier at her left hand was shot dead, and three others wounded near her. She escaped with two shots through her coat, and one through her cap

During their stay at White Plains, Generals Washington and Rochambeau removed their main armies to the southward, and orders were soon received that the part remaining near New York should immediately repair to Williamsburgh, Va. They accordingly marched to the city of New York, and embarked in ships to Jamestown, where they landed and marched the short distance to Williamsburgh and joined the main troop

On the next morning after their arrival, General Washington ...ed the armies on parade, whe... read to the soldiers, after which General Washington, placing himself immediately in front of the ranks, said —"If the enemy should be tempted to meet our army on its march, the general particularly enjoins the troops to place their principal reliance on the bayonet, that they may prove the vanity of the boast which the British make of their peculiar prowess in deciding battles by that weapon"

After which the American and French commanders each personally addressed their armies

Our young soldier happened to stand within ten yards of General Washington when he made the above remarks, and in after years she has frequently remarked that, "he spoke with firm articulation and winning gestures, but his aspect and solemn mode of utterance affectingly bespoke the great weight that rested on his mind."

The soldiers were before mostly ignorant of the expedition upon which they were going, but from the information received by the affectionate addresses of their leaders, every countenance, even of many who had discovered a mutinising spirit, wore an agreeable aspect, and a mutual harmony and reverential acquiescence in the injunctions of their commanders, were recognized through the whole. The phalanx composed the advanced guards, and was commanded by the Marquis Lafayette Our heroine was one of this company, and by reason of the absence of a non-commissioned officer she was appointed to supply his place. After these preliminaries had been adjusted, they took up their march toward York-Town. They came within two miles of it, about sunset, when Colonel Scammel, the officer of the day, brought word for the armies to halt at that point. The officers and soldiers were strictly enjoined to lie on their arms all night.

Such language (strange to say) seemed perfectly familiar to our fair soldier, it did not even excite in her a terror, although it was a prelude to imminent danger.

Anticipating no greater danger than she had before experienced, although she foreboded a great event, she acquiesced in the mandates of her officers with a calmness that might have surprised an experienced soldier.

Next morning after the roll-call, they were reviewed, and went through the quick motions of loading and firing blank cartridges and the exercise of the broad-sword. They formed in close column, displayed to the right and left, and formed again. The grand division then displayed, formed by platoon and were ordered to march in the best order; which soon brought them in sight of the enemy's works. The next day Colonel Scammel, while reconnoitering, was mortally wounded, and taken prisoner, by a party of horse in ambuscade

York-Town being now strongly invested by the allied armies, they began to form their lines and prepare their works; the French extending from the river above the town to a morass, where they were met by the Americans on the right, and their hard labours began.

For more than a week were they employed throwing up their works, sustaining frequent and heavy cannonading from the besieged

This came near proving too much for a female not yet twenty years of age, but, being naturally ambitious, she was unwilling to submit, although her hands were in such blisters she could ...rely open or shut them. Many apparently able-bodied men complained of their inability, and were relieved, this, instead of being an example for her to follow, proved only an incentive to her exertions, and she was resolved to persevere as long as nature would sustain her efforts. On the ninth day they completed their entrenchments, when a fierce cannonade and bombardment commenced, which lasted all night without interruption Next morning the French opened the redoubts and batteries on the left, and a tremendous roar of cannon and mortars continued that day without ceasing

Our heroine had never before seen the main armies together, but now, brought into view of them, and led on to a general ...., he describes the ground as actually trembling beneath her from the tremendous firing from both sides, which had been kept up for a day and a night. She describes the ...ght scenes as solemn and sublime to the highest degree, perpetual sheets of fire and smoke belching as from a volcano, and ... ... skit

Two bastion redoubts of the enemy having advanced two hundred yards on the left, which checked the progress of our forces, it was proposed to reduce them by storm, and to inspire emulation in the troops, the reduction of one was committed to the Americans and the other to the French

A select corps was chosen, and the command given to Lafayette, with orders to manage as he thought best. Our heroine was one of those who marched to the assault with unloaded arms, but with fixed bayonets, with unexampled bravery attacking on all sides at once, which, after some resistance, the Americans were complete victors of the redoubts of the enemy. As they were leaving the fort, one of the soldiers clapped our heroine on the shoulder, exclaiming, "*My lad, you are somewhat unslightly behind*" Not knowing what it meant, she at that moment took no notice of the remark till an opportunity presented, when she found the left skirt of her coat hanging by a string, which must have been the effect of a broad-sword, or a very close shot. Matters now appeared to be coming to a crisis, and nothing less than inevitable ruin, or an entire surrender awaited the British commander; he, however, on the 9th of October after three weeks' storm, accepted the terms of capitulation

Our young soldier was within sight, when the British commander presented his sword to the illustrious Washington, and in her relation of the scene has often remarked the magnanimity which Washington displayed through the whole of this trying scene His country was saved! Thus was the grand pillar of war shattered to its base, and an ample foundation laid for the establishment of peace secured to a free people

After a long and tedious march to the head of the Elk river, as well as a disagreeable voyage by sea, we find our heroine at her old quarters at West Point. On the arrival of the troops, a colonnade was ordered to be commenced, on which she worked against the most robust and expert soldier till the whole was finished As soon as she found more leisure, she determined on writing to her mother, for at times she felt unhappy at the distress her long absence, or supposed death, must have caused her. The following is a very true copy of the letter now in existence.

"*May*, 1782.

"DEAR PARENT,—On the margin of one of those rivers which intersects and winds itself so beautifully majestic through a vast extent of country of the United States, is the present situation of your unworthy but constant and affec-

tionate daughter —I pretend not to justify or even palliate my clandestine elopement

"In hopes of pacifying your mind, which I am sure must be afflicted beyond measure, I write you this scrawl. I am in a large but well-regulated family. My employment is agreeable, although it is somewhat different and more intense than it was at home; but I apprehend it is equally advantageous.

I have become mistress of many useful lessons, though I have many more to learn. Be not troubled, therefore, about my present or future engagements, as I will endeavour to make that prudence my model, for which, I own, I am indebted to those who took the charge of my youth Heaven grant that a speedy and lasting peace may constitute us a happy and independent nation; that I may once more return to the embrace of a parent whom I love.—Your affectionate daughter

'DEBORAH SAMPSON"

The perusal of the above original letter will prove that Deborah Sampson was not without a mind superior to many she was obliged to make her associates, and that modesty and virtue was the talisman under which she was to surmount the greatest difficulties The business of war at all times is nothing less than devastation, rapine, and murder, and in the war of the Revolution these principles were never better exemplified. Hence the necessity of scouting, which was the common business of infantry to which our heroine belonged.

A request was made by two sergeants and herself to leave of their captain to retaliate on some refugees and Tories for their outrageous insults to the inhabitants beyond their lines.

He replied —"*You three boys have contrived a plan this night to be killed, and I have no men to lose*" He, however, reluctantly consented, and they beat for volunteers Nearly all the company turned out, but only twenty were permitted to go; near the close of the day they commenced their expedition They passed a number of guards, and went as far as East Chester undiscovered, where they lay in ambush to watch the motions of those who might be on the plundering business. They quickly discovered that two parties had gone out, and whilst they were contriving how to entrap them, they watched two boys who had been sent for provisions to a private cellar prepared in the wood One of them informed them that a party had just been at his mother's, and were gone to visit the *Yankees* who were guarding the lines Concealing from them that they were Americans, they accompanied them to the cellar, or cave, which they found well stored with provisions, such as bacon, butter, cheese, crouts, and jars of honey They made a delicious repast on the spot, and afterward filled their sacks with as much as they could carry.

Dividing into two parties of ten each, they sent out centinels, and again ambushed in a place called in Dutch, *Vonkonte* About four o'clock the following morning they had a sharp skirmish with some Tories, shots were sharply exchanged, but on approaching their enemy sufficiently near, they found horses alone—their riders had fled.

Our heroine mounted an excellent horse, and with her party pursued the enemy to the edge of a swamp, here they begged for quarter, and were let go They soon came up with another party, about thirty in number, who seemed inclined to give them some trouble. Shots were exchanged for some few minutes, when one of our party was wounded, which made it necessary to retreat, at this moment the dauntless young soldier felt a severe blow just above her knee, and exclaimed to her comrades that she was wounded, but not very severely, but at the same instant she thought she felt something unusually warm trickling down her neck, and putting her hand to the place, found the blood gushing from the left side of her head freely She said nothing, as she thought it no time to talk of wounds, unless mortal. Her boot, from the motion the ball had made, was filled with

She told one of the sergeants that she was now so wounded she could ride no farther, and begged they would leave her in the woods where they were at that moment, to this her comrades would not listen, but took her before one of them on his horse. A thousand thoughts at once darted through her mind, as she had always thought that she would rather die than that her sex should be disclosed to the army

They at length, after riding in this painful state for six miles, came to the French encampment, near what they called *Crom Pond*. She says it was to her like being carried to a place of execution. They were conducted by an officer of the guards to an old building, at that time bearing the name of hospital, in which were a number of invalids, whose very looks made her blood chill in her veins. The French surgeon came and prepared to dress her head, she said nothing of the other wound she had received, she requested the favour of more medicine than she needed for her head; and taking the opportunity, with a penknife and a needle, she extracted the ball, using the same precaution which the surgeon had for her head. She remained in the hovel for three weeks, and by strict attention both wounds were perfectly healed, one without the knowledge of any one but herself.

In the spring of 1783, peace began to be the general topic, and was actually announced by Congress. In the month of April, General Patterson selected her for his attendant and aid, as he had previously become acquainted with her heroic fidelity, and on the 19th of the same month cessation from hostilities was proclaimed, and the honorary badge of distinction, as established by Washington, conferred on the brave soldiers, of which our heroine was one of the recipients. The general became daily more attached to his new attendant, and treated her more as an equal than a subordinate, her manly deportment, blended with the milder graces of her sex and youth, filled him with admiration. General Patterson, with a detachment of 1,500 men, was ordered to Philadelphia for the suppression of a mutiny among the American soldiers Having some affairs of her general to arrange, she did not go till four days after, when she rode in company with four gentlemen through the Jerseys and part of Pennsylvania In passing through one of the villages in Jersey, at the hotel where they were to remain for the night, there happened to be a ball, the young soldiers were invited to join the party, where the youthful appearance and good manners of our heroine made her the lion of the evening. Little did she think that her winning manners would that evening make a tender impression on one present, who would subsequently reveal to her the emotions she felt on her account They were detained at this place two days on account of a duel between Lieut Stone and Captain Hitchcock, when the latter was killed

On their arrival in Philadelphia, she found the troops encamped on an eminence about half a mile from the city, where they had been despatched on account of an epidemic of that time raging there She had not been here many days before she was selected as one of its victims, and removed to a place called a hospital, provided during the raging of this malady Death itself could not have presented a more gloomy aspect, and to her it seemed not far distant, as multitudes were daily carried to their last home She was placed in a room with two young officers of the same line, both of whom soon died, and left her alone to ponder over her wretched situation. Her disease seemed increasing, and at last she became so low, that the attendant, believing that she was dead, had summoned the sexton to perform the last office. At this moment one of the nurses coming in wetted her lips with cold water, which once more rallied the small remains of nature, and she gave signs of life. The nurse informed the physician that Robert was still alive, he approached her bed, and putting his hand into her bosom, was surprised to find an inner waistcoat tightly compressing her breasts. Ripping it up in haste, he was still more astonished, not only in finding life, but that Robert Shurtliffe was a female in the attire of a soldier. He had her removed immediately into the matron's apartment, and from that time to her recovery, treated her with all the care that art and experience could bestow. The amiable physician had the prudence to conceal this important discovery from every breast but the matron.

Our heroine slowly recovered and became a welcome guest in many wealthy families, still known only as a continental soldier. We must be permitted to digress for a moment to relate an incident without which this sketch would be bereft of one of its most attractive features. During their stay at the village in Jersey, and attendance at the ball before mentioned, our heroine became acquainted with a young lady from Baltimore, who was on a visit in that place This lady was the daughter of a gentleman of wealth, and possessed considerable fortune in her own hands. At the ball our fair soldier was her partner in the dance, and it so happened that they met several times during the short stay of the soldiers At first the young

lady attempted to check the impulse as the effect of a giddy passion, but at length suffered it to play about her heart unchided.

She followed the gallant young soldier to Philadelphia, and hearing he was then in the hospital, suffering from the epidemic then fatally raging there, she despatched a messenger with a basket containing some choice fruit, and the following letter:—

"Dear Sir,—Fraught with the feelings of a friend who is, doubtless beyond your conception, interested in your health and happiness, I take the liberty to address you with a frankness which nothing but the purest friendship and affection can palliate. Know, then, that the charms I first read in your countenance brought a passion into my bosom, for which I could not account. If it is from the thing called Love, I was before mostly ignorant of it, and strove to stifle the fugitive, though I confess that the indulgence was agreeable. But repeated interviews with you kindled into a flame I do not blush to own, and should it meet a generous return, I shall not reproach myself for its indulgence—I have long sought to hear your residence: and how painful is the news I this moment received, that you are sick, if alive, in the hospital.

"Your complicated nerves will not admit of writing, but inform the bearer if you are in want of anything [illegible] can purchase to conduce to your comfort, if you recover, and think proper to inquire my name, I will give you an opportunity, but if death is to terminate your existence, then let your last senses be impressed with the reflection that you die not without one more friend, whose tears will bedew your funeral obsequies. "Adieu."

Some have been charmed, others surprised by love from an unsuspected source, but our heroine alone can describe the effect and perturbation such a declaration had on her mind, she humbly returned her gratitude, at the same time saying she was not at that moment in the want of anything with the exception of health.

In the evening she received a basket [illegible] fruit, a bouquet of fragrant flowers, and [illegible] favours were very frequently repeated during her illness. But she knew not in whose bosom this flame was glowing, or whose heart continued so much worth.

Her health now being nearly restored, she was at times exceedingly distressed, fearing that a discovery had been made during her sickness.

Every zephyr became an ill-fated omen, and every salutation a mandate to summon her to a retribution for her imposition on the male character. The physician, who had been so tender and kind to her during her severe indisposition, was now waiting an opportunity to divulge to her his suspicion of her sex. He often found her dejected, and as he guessed the cause, introduced lively conversation. He took an opportunity to introduce her to his daughters, who were much pleased at the attentions of gallantry of so handsome a young soldier, little suspecting that then gallant, on the strength of whose arm and sword they had depended, was a female.

After she had prepared to join the troops, the doctor, availing himself of a private conference, asked her if she had any particular confidant in the army. She replied, "Not one!" and trembling, she would have disclosed the secret, but seeing her confusion, he waived the conversation. After joining the troops, General Patterson, with two other officers, having occasion to visit Baltimore, took her with them.

On the next day after their arrival, she received a note requesting her company for a few moments at a certain place. Though confident she had before seen the writing, she could not conjecture from whom it came. Prompted by curiosity, she went to the house as directed by the note, and being conducted into an elegant drawing-room, was struck with admiration on finding alone a beautiful young lady of about seventeen years of age. After the usual compliments on both sides, the young lady very frankly [illegible] herself the author of the anonymous letter, and rehearsed her sentiments with that unreservedness which evinced the sincerity of her passion, and the elevation of her soul.

This confession was the strongest evidence that the young lady possessed all she had declared, her effusion flowed with that affability, prudence, and dignified grace which might have fired the breast of an anchorite—inanimate nature itself would have waked into life, and even the superstitious cowled friar might have revoked his vows of celibacy, and have flown to the embraces of an object exhibiting so many charms in her eloquence of love. Deborah remained in this school of philosophy [illegible] two days, promising to visit her young friend frequently. General Patterson and his brother officers, having some business with General Washington, proposed making a hasty visit to Mount Vernon, our heroine begged that she might accompany them, in order to give time for reflection on which way to act in this, to her most trying affair, and next, as she used to say, to take the last look at the illustrious chief whom she so ardently loved. Having returned to Baltimore, she, according to promise, paid a visit to her [illegible] found, feeling as she [illegible] hath many [illegible] to [illegible] of the mask, or [illegible] a passion which she feared had too much involved the happiness of one of the choicest of her sex. After thanking her kind friend for her generous esteem, and many evasive apologies—that she was but a stripling soldier, that, had she inclination, indigence would forbid her settling in the world; the innocent girl replied, that sooner than a concession should take place with reluctance, she would forfeit every enjoyment which was only in her power to bestow. But she added, that

as the only obstacle, she was quickly to be possessed of ample fortune in her own right, and finally intimated her desire that she would not leave her. Touched with such a pathetic union of love and beauty, our fair soldier was thrown off her guard, and her feelings gave vent in a flood of tears. She told the lady she must go to the North to arrange some affairs, and apply for her discharge, and in a few months would return, when, if she could conduce to her happiness, she should be supremely happy. Thus parted two lovers, more *sensible*, if not more *constant*, than perhaps ever distinguished the soil of America. Immediately after their separation, the young lady sent a messenger after our heroine with a present of twenty-five guineas, six linen shirts, and a watch, which is still in the possession of the descendants of this extraordinary female. The [illegible] with then attendant, Robert, had arrived in Philadelphia, the following day General Patterson sent for our young soldier to his apartment. He was alone, and calling her to him, thus gracefully addressed her—"Since you have continued nearly three years in the service of your country, always vigilant and faithful, and, in many respects, distinguished yourself from your fellows, I would only ask—does that martial attire which now glitters on your body conceal a female's form?" She was overwhelmed by the interrogatory, and fell on her knees before him, the good man raised her up, and pressing her to his bosom, presented her with a letter, saying, "Here is your full change, obtained the other day at Mount Vernon from our beloved father, the illustrious Washington, and here is a sum of money to defray your expenses to your family, your unrivalled achievements deserve ample compensation, return to your friends, and assume that garb which you had aside to aid in the struggles of your country."

The young soldier stood before him suffused in tears, but earnestly requested, as a pledge of his virtue, that strict inquiry should be made of those with whom she had been a messmate. This was accordingly done, which proved perfectly satisfactory to her officers who, with the men, were thunder-struck at such information.

Thus ended the military life of Deborah Sampson, the continental soldier of seventy-six.

Her mother being still living, she returned to her home as an asylum from the clumsy which necessarily would follow such a singular life, and to assume a course of life which only could be an ornament to her sex. Shortly after her return she commenced teaching school, which continued for four years, when she [illegible] married Benjamin Gannett, a respectable [illegible], Massachusetts, by whom she had three children. She lived to a great age, her husband, who outlived her, obtained a pension during the remainder of his life by an act of Congress, entitled "An act for the relief of [illegible] widows or orphans, where there [illegible] served in the war of the Revolution."

No pains have been spared to place these historical facts in their proper light, they have been compiled from Congressional documents, and other equally authentic sources.

ST. JAMES'S

THE *habitués* of St. James', albeit the adjoining parish to St. Giles', are a distinct race; a purer, brighter, finer, and, withal, a richer kind of human clay; a porcelain highly decorated with gold and colours, and not to be confounded for an instant with the ordinary earthenware of common mortals. Look on and admire, oh connoisseurs in thorough bred humanity. Is it not a beautiful sight to see, caracolling in Rotten-row, or treading, with "stately step and slow," the pavement of Pall-mall, those beautiful specimens of refined and delicate womankind which grace the London season—a short four months, from April to July? And yet, oh philosophic observer, they are of the self-same dust as yon shivering wretch upon the highway-side, who pleads in rags and self-abasement for the wherewithal to feed his miserable babes at home. There's something in the thought that silk-and-satin-clad woman cannot bear to entertain; but it is none the less true, for all that.

St. James's! A host of images rise up at the words; and for a moment we indulge our wandering fancy. For more than two hundred years the chosen residence of the aristocracy, the path has peculiar claims on our regard—for here monarch d senator, prelate and poet, lady fair and warrior brave, h lived and made merry and died. Change upon change. Dynasties flourish and decay, and the outward face of the quarter loses all likeness of what it was; and yet is St. James's still the same—still gay and glorious as of yore.

ST. JAMES'S.—COMING FROM CHURCH.

The palace, as a matter of course, is a prominent object in the thoughts of all wanderers about St. James's, though no part of the original edifice—once an hospital dedicated to St James, and converted into a manor by Harry the Eighth—remains, except the ugly, patched old red brick gateway facing the street, and a part of the building now called the Chapel Royal Yes, just one other relic in the initials H. A., engraven on the chimney-piece of the old presence-chamber—Henry and the ill-fated Anne Boleyn. This palace, with various alterations and improvements, buildings up and pullings-down, has been the London residence of our sovereigns from the reign of

ST. JAMES'S.—THE PORTAL OF THE PALACE.

William III to that of Victoria. The first monarch was driven hither by the fire in Whitehall, which destroyed the whole of that palace, except Inigo Jones's Banquetting-house, and her Majesty left St. James's to inhabit Buckingham Palace, a building which has ever since been declared unfit for the residence of a married sovereign. That the expensive pile, erected by the "finest gentleman in Europe," is *not*—spite of recent additions—fitted to fulfil all the purposes of a palace, may or may not be true; at any rate, the Queen's Drawing-rooms are still held in St James's, Buckingham Palace possessing no suite of rooms large enough for such purposes.

The old palace is sacred to many memories. Within its walls died Mary the Catholic, and Henry Prince of Wales, eldest son of James I. Here was born the "merry monarch," and in a room in the palace the unhappy and misguided Charles I took leave of his children—two of whom afterwards ascended the throne—on the day before his execution. The last night of his life he passed here, and in the morning walked bareheaded through the park, guarded and gazed upon, to the scaffold at Whitehall. In this house was born the old pretender, son of James II. and Mary of Modena, conveyed, it is said, in a warming-pan to her Majesty's bed-chamber. The Princess, afterwards Queen Anne, declared that St. James's Palace was much the properest place to act such a cheat in" To the readers of the secret history of the English Court, many curious, and some not most delicate, revelations may be sought in the annals of St. James's. Enough for the present if the above Queen Caroline, wife of George II., died here. Within these walls the royal profligate, George Augustus Frederick, first saw the light, and danced, a pretty chubby boy, upon his mother's knee!

In St James's Chapel—the Chapel Royal, on the right from the entrance—service is performed daily, at eight in the morning and at noon—by the choristers and Queen's chaplains. This has been the private chapel of the palace from the reign

of Anne to Victoria, and in it have been celebrated no fewer than four royal weddings, besides that of the great Sir Christopher Wren, whose marriage to his second wife, Jane Fitzwilliam, is stated in the register to have taken place on the 24th of February, 1676.

In the park at the back—originally the private grounds of the palace, but now recognised as the people's property, inalienable for ever—royalty once disported daily, and in the "Mall," the gravel walk from Constitution-hill to Spring-gardens, we have preserved the memories of Charles II, whose favorite recreation was carried on there, and Nell Gwynne, whose garden overlooked the spot where her royal lover used to amuse himself with his dogs, and feed the ducks in the water. The "Mall," however, where Charles played at the once fashionable game to which it owes its designation, is now Pall Mall.

St. James'-street, St James'-square, and St James'-place, have changed vastly in appearance, but not much in character, from the time of the second Charles. It it boasted its great men and its fine houses then, it has no lack of either now. We walk down St James'-street, a street of palaces, and think of Waller and Pope, who resided here. We glance at St James'-square, and muse of the time when Johnson and Savage walked round it for want of a lodging, brimful of patriotism, and resolved to "stand by their country." Our steps lead within sight of the houses in St James'-place, the backs of them looking into the park, and, thinking of Addison (who lived here in 1700), remember that we have a living poet in Samuel Rogers, who lives there still—one who is not only a poet, but a rich man, a banker, and a connoisseur. His house overlooks the park, you may know it by the pink curtained verandahs.

We pause a moment in our walk as we think of these things, and we are gazing curiously at a couple of old gentlemen who stand at the windows of the Conservative Club-house, when our thoughts are suddenly brought back to the present by a small cold splash on our darker cheek. It comes from the wheel of Lady Fitzwanbanch's carriage, as it dashes homeward from the *chef d'œuvre* of Wren, the church of St. James', Piccadilly. We are in the wilderness, and fully awake to the passing scene. Out pour the throng of well-dressed worshippers from church porch and chapel-royal, "miserable sinners" in satin, and lace, and broadcloth, and fine linen, in richly-appointed vehicles, or on foot, with a man-servant behind to carry the books, just as our artist has depicted them.

Where are the poor? They show no face in the gay street among the proud and wealthy, but slink back to their dim, fireless hovels, or stand aloof and gaze, quite unthought of by they who, half an hour ago, knelt down and prayed that the Great Father might defend and pity the widow and the orphan, might "comfort and help the weak-hearted, and raise up them that fall," might provide for the desolate and oppressed, and "succour, help, and comfort, all that are in danger, necessity, and tribulation."

Do we say that there are none among all that crowd who have open hands and charitable hearts? God forbid! But we do say—and it is the shame of our time that it can be truly said—that, in spite of our numerous charities, and our hospitals like palaces, private benevolence, the goodness which [illegible] out want, the perseverance which becomes acquainted with the homes and condition of the poor, the large-hearted charity which is not afraid of the opinion of the world, is rarely to be found among the habitues of St James'. It is no part of our purpose to enlist the feelings of the poor again the rich, many of whom are charitable to a fault, and credulous beyond conception, but [illegible] classes may [illegible] the *very* poor.

The poor? Oh, my friends, the poor are most carefully driven out of the way by the frown of the great man, the beadle.—The greatest man (in his own estimation) in the greatest—that is, the richest and the proudest—parish in London, is the beadle. The beadle of St. James'! No wonder the little boys run away as they see him, staff in hand, coming out of the churchyard. We have a kind of awe of him ourself, he is so great and important a personage.

The winter's sun is shining brightly, and the clear air is very dry and cheerful. The houses have a quiet, comfortable look, and the shops are close shut up. From where we stand we watch the carriages as they dash by, and the pedestrians, as they saunter homewards. It is a fine sight. No hurry and bustle as on other days,—all is quiet, orderly, subdued gaiety. No policemen, no poor, no traffickers in the streets. No poor? Yes, one old sweeper, standing, with expectant hand, by the highway-crossing; but the weather is too dry for folks to think of him.

A couple of hours, and the short winter sun has set, and lights begin to stream from behind red damask curtains, and night comes on. Few pedestrians are seen in the streets, and the silence is only broken now and then by the rattle of distant wheels. The club-houses windows shine out upon the road in broad patches of light, one after another the street lamps are illuminated, loud knocks at the doors reverberate through the air; a policeman or two stand at the corners, and night sets in. night, like a pall that falls on beds of down and curtained wealth, and hides from sight and banishes from remembrance unhealthy hovels and naked wretchedness. A few brick walls and darker streets alone divide them. Do the words of comfort spoken from a thousand pulpits, the words of blessing and of hope, carry the same meaning to all hearers and all hearts? or do not the holy words become perverted

understandings, He hath filled the rich with good things, and the hungry he hath sent empty away? How [illegible] is the thought!

BENJAMIN DISRAELI'S OPINION OF SIR ROBERT PEEL.

(*From "The Biography of Lord George Bentinck."*)

Nature had combined in Sir Robert Peel many admirable parts. In him a physical frame incapable of fatigue was united to an understanding equally vigorous and flexible. He was gifted with the faculty of method in the highest degree, and with great powers of [illegible] which were sustained by a prodigious memory, which [illegible] his acquisitions with clear and fluent elocution. Such a man, under any circumstances, and in any sphere of life, would probably have become remarkable. Ordained from his youth to be busied with the affairs of a great empire, such a man, after long years of observation, practice, and perpetual discipline, would have become what Sir Robert Peel was in the latter portion of his life—a transcendant administrator of public business, and a matchless master of debate in a popular assembly. In the course of time the method which was natural to Sir Robert Peel had matured into a habit of such expertness, that no one in the dispatch of affairs ever adapted the means more fitly to the end. His original flexibility had ripened into consummate tact; his memory had accumulated such stores of political information, that he could bring luminously together all that was necessary to establish or illustrate a subject; while in the House of Commons he was equally eminent in exposition and in reply—in the first, distinguished by his arrangement, his clearness, and his completeness, in the second, ready, ingenious, and adroit, prompt in detecting the weak points of his adversary, and dexterous in extricating himself from an embarrassing position.

Thus gifted and thus accomplished, Sir Robert Peel had a great deficiency, he was without imagination. Wanting imagination, [illegible] was [illegible] No one was more sagacious when dealing with [illegible] before him—no one penetrated the [illegible] with [illegible] accuracy. His judgment was faultless, provided he had not to deal with the future. Thus it happened through his long career, that, while he was always looked upon as the most prudent and safest of leaders, he ever, after a protracted display of admirable tactics, concluded his campaign by surrendering at discretion. He was so adroit that he could prolong resistance even beyond its term, but so little foreseeing, that often, in the very triumph of his manœuvres, he found himself in an untenable position. And so it came to pass that Roman Catholic Emancipation, Parliamentary Reform, and the abrogation of our commercial system, were all carried in haste or in passion, and without conditions or mitigatory arrangements.

As an orator, Sir Robert Peel had, perhaps, the most available talent that has ever been brought to bear in the House of Commons. We have mentioned that both in exposition and in reply he was equally eminent. His statements were perspicuous, com-

plete, and dignified, when he combated the objections or criti- of the propositions of an opponent, he was adroit and acute; no sp aker ever sustained a process of argumentation in public assembly more loudly, and none as debaters have united in so conspicuous a degree prudence with promptness In the higher efforts of oratory he was not successful. His vocabulary was ample and never mean; but it was neither rich nor rare. His speeches will afford no sentiment of surpassing grandeur or beauty that will linger in the ears of coming generations He embalmed no great political truth in immortal words His flights were ponderous, he soared with the wing of a vulture rather than the plume of an eagle, and his perorations, when most elaborate, were most unwieldy In pathos he was quite deficient, when he attempted to touch the tender passions, it was painful His face became distorted, like that of a woman who wants to cry, but cannot succeed Orators certainly should not shed tears, but there are moments when, as the Italians say, the voice should weep The taste of Sir Robert Peel was highly cultivated, but it was no originally fine, he had no wit, but he had a keen sense of the ridiculous, and an abundant vein of genuine humour Notwithstanding his artificial reserve, he had a hearty and merry laugh, and sometimes his mirth was uncontrollable He was gifted with an admirable organ—perhaps the finest that has been heard in the house in our day, unless we except the thrilling tones of O'Connell Sir Robert Peel also modulated his voice with great skill His enunciation was very clear, though somewhat marred by provincialisms His great deficiency was want of nature, which made him often appear, even with a good cause, more plausible than persuasive and more specious than convincing He may be said to have gradually introduced a new style to the House of Commons, which was suited to the age in which he chiefly flourished, and to the novel elements of the assembly which he had to guide He had to deal with greater details than his predecessors, and he had in many instances to address those who were deficient in previous knowledge Something of the lecture, therefore, entered into his displays This style may be called the didactic

Sir Robert Peel was a very good looking man He was tall, and though of late years he had become portly, had to the last a comely presence Thirty years ago when he was young and ithe, with curling brown hair, he had a very radiant expression of countenance His brow was very distinguished, not so much for its intellectual development, although that was of a very high order, as for its remarkably frank expression, so different from his character in life The expression of the brow might even be said to amount to beauty The rest of the features did not, however, sustain this impression The eye was not good, it was sly, and he had an awkward habit of looking askance He had the fatal defect, also, of a long upper lip, and his mouth was compressed

One cannot say of Sir Robert Peel, notwithstanding his unrivalled powers of despatching affairs, that he was the greatest statesman that this country ever produced, because twice placed at the helm, and on the second occasion with the Court and Parliament equally devoted to him, he never could maintain himself in power Nor, notwithstanding his consummate Parliamentary tactics, can he be described as the greatest party leader that ever flourished among us, for he contrived to destroy the most compact, powerful, and devoted party, that ever followed the British statesman Certainly, notwithstanding his great sway in debate, we cannot recognise him as our greatest orator, for in many of the supreme qualities of oratory he was singularly deficient But what he really was, and what posterity will acknowledge him to have been, is the greatest [illegible] that ever lived

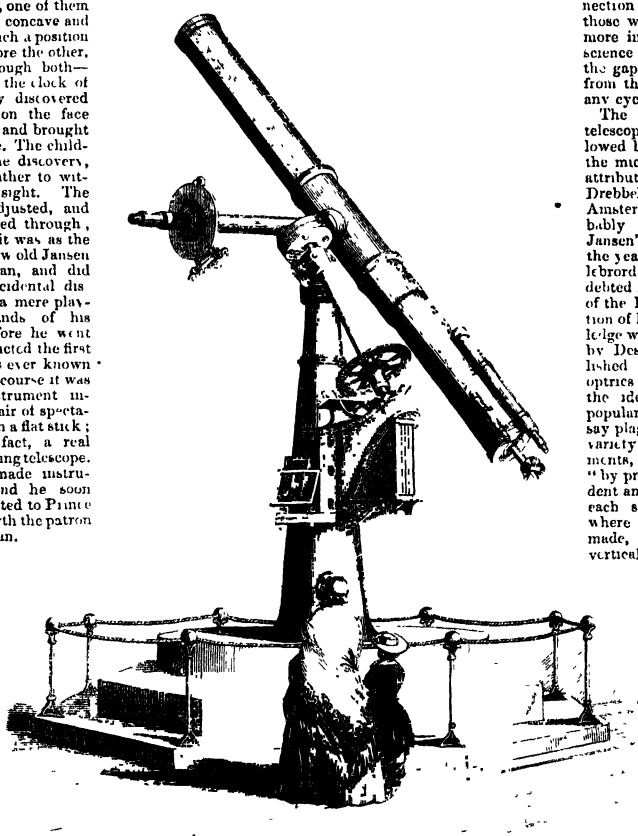
Peace to his ashes! His name will often be appealed to in the scene which he loved so well, and never without homage even by his opponents

This estimate, observes a contemporary, is not essentially unfair, but it is far from being perfect or complete The intellectual and personal qualities of the great departed are dealt with, on the whole, in a fair spirit, but his high minded devotion to the rights and interests of the people are utterly overlooked. The writer adds—

"The one grand quality omitted by Disraeli, is the moral courage and self devotion of the great minister What Lord George Bentinck and Mr Disraeli have called perfidy, we should designate as lofty and patriotic heroism The biographer somewhere states that Sir Robert Peel was a man being constantly educated. It is true; and every step of his education was marked by rise in the position and the prospects of his country and his countrymen. He had the devotion and the grandeur of mind to avow his errors, and to act upon his new convictions. He did this at the most cruel sacrifice. For this he broke up old ties and old friendships, which it must have wrung his heart to sunder. For this he placidly submitted to the humiliation of confessing error, and to the insults of those who, like Mr. Disraeli, could conceive no higher motive for a minister changing his sentiments than the bullying of out-of-doors importunity, or the mere idle fickleness of a wanton temperament Sir Robert Peel had his own reward in his own breast Thoroughly a man of the day, as Mr Disraeli calls him, he saw with supernatural clearness what must be in his day—what ought to be—what would be He saw, when they actually came before him, in all their distinctness, the good and the evil, and to the good he clave with a strong power of will, and a mighty disregard of party prejudice and party intrigues—even of old association, and those habitual trains of thought so difficult to break—which proclaimed the very sublimity of self-sacrifice. Many of the members of the House of Commons did not understand Sir Robert Peel, and they raised a cuckoo cry of 'traitor,' round the Minister But his self-sacrifice was understood by the people It penetrated deep into the masses It was discussed and acknowledged in the 'humble homes of those who earned their bread by the sweat of their brow,' and suddenly Sir R Peel became invested with a degree of deep and hearty popularity founded upon gratitude, of which few or no examples are to be found in our history It was when the fatal catastrophe arrived which removed him from us, that a striking visible token of this sentiment, amounting almost to affection, was given. Sir Robert lay in Whitehall, and the rumour was noised abroad that the injury was dangerous—mortal From that time forth till all was over, in the day and in the night, a sad and silent crowd kept watch near where he lay. They were poor men and women They were always going and coming, yet always there. We watched them at midnight and at noon They whispered the bulletin to each other, and spoke softly of the great spirit about to pass away There were many in tears Mr Disraeli, going and returning from the house, must have seen this gathering Did it read no lesson to him? Was he not struck with the truth that no army which ever guarded a palace was half so grand, so touching, or so significant a spectacle as the group of poor people performing that solemn voluntary vigil?

I CANNOT DO IT

"I cannot do it," 'tis a phrase,
Which I record with deep regret
As spoken and pondered by the lazy
A want of energy of mind
You cannot do it? Yes, you can!
The secret to success lies here—
"First prudently consider your plan,
Then resolutely PERSEVERE!"



Try, earnestly and promptly try,—
As yet you know but half your skill,
The numbered difficulties fly
Before a bold determined will—
Like clouds before the swelling breeze,
Driven onward till they disappear
Seize, energetically seize,
Each favouring moment—PERSEVERE!

Thus will the wonder you'll achieve,
Like long your very self surprise,
Discard the words—"I cannot"—leave
Ah! many a bright hope buried lies
Entombed in the unworthy grave
Which they have dug for genius here!
Resolve, then, not to be the slave
Of coward ice, but PERSEVERE!

Your motto "Onward!" sing, delve, toil,
Turn the unwilling soil,
Conquer every hindrance tardy,
And victory shall reward your toil.
The pitiful, ignoble strain,
"I cannot do it," hence forbear!
And know whoever would obtain
A deathless name, must PERSEVERE!

THE TELESCOPE.

More than two hundred and fifty years ago the children of Zecharian Jansen, a poor spectacle-maker, were amusing themselves in their father's shop at Middleburgh, an ancient town in Holland. Now the children of the poor in the sixteenth century were as badly, if not worse off for playthings, than they are now; and so it is no wonder that the young Jansens, for want of anything better, amused themselves with the spectacle-glasses from their father's shopboard. And thus it happened that one day, while they were spying through the glasses at the objects outside the house, one of them chanced to put a concave and convex lens in such a position—holding one before the other, so as to look through both—that, on gazing at the clock of the church, they discovered that the figures on the face were made larger and brought nearer than before. The children, pleased at the discovery, called their old father to witness the strange sight. The glasses were re-adjusted, and the old man looked through, and sure enough it was as the children said. Now old Jansen was a shrewd man, and did not allow the accidental discovery to remain a mere plaything in the hands of his children, for, before he went to bed, he constructed the first telescope that was ever known in the world,—of course it was a very rude instrument indeed—merely a pair of spectacle-glasses fixed on a flat stick; but it was, in fact, a real dioptric, or refracting telescope. A more neatly-made instrument of this kind he soon afterwards presented to Prince Maurice, henceforth the patron of the poor optician.

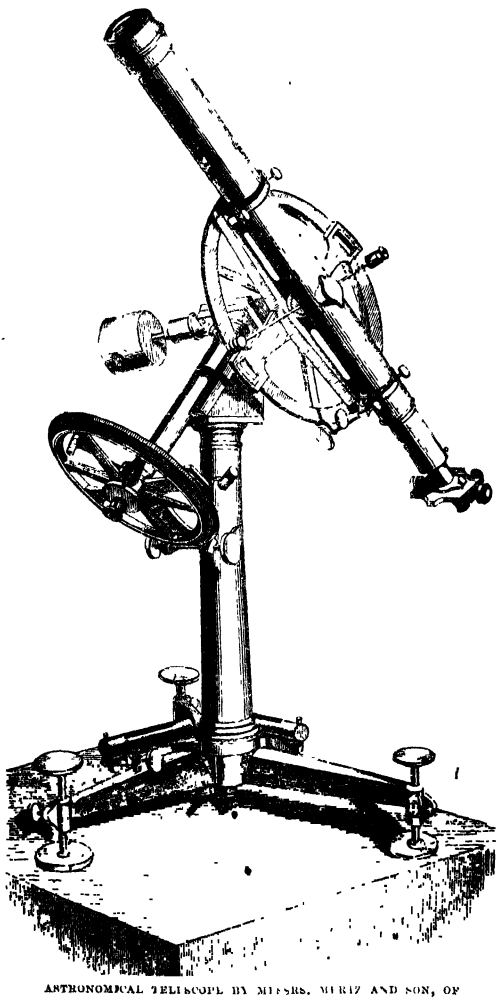
LARGE ASTRONOMICAL TELESCOPE, INVENTED AND MANUFACTURED BY MR. A. ROSS, HEATHERSTONE-BUILDINGS, HOLBORN.

The accidental discovery of the instrument which was destined in after ages to add so much to the knowledge and pleasure of mankind, soon became known to the scientific in Europe, and, before the birth of the seventeenth century—for the occurrence related happened about the year 1590,—Galileo, Kelper, Bacon, and other philosophers, commenced those investigations in astronomy which Descartes, Hook, Leibnitz, Newton, Herschell, Arago, and others, carried forward with such success, that not only was a regular system of starry-worlds developed, but new planets, stars, and comets revealed to the astonished gaze of the scientific. And not to the scientific alone was the telescope, thus fortuitously discovered, of immense utility, for by its aid the navigator was enabled to pursue his voyage with greater certainty, and a great field of amusement and instruction opened to the people.

It has often been remarked in the history of science, that what severe and painful study and investigation had failed to accomplish, has been effected by apparent accident. Boyle, Bacon, Dee, and Digges, invented instruments by which minute objects were made to appear nearer; yet it remained, as we have seen, for the children of a poor optician to discover the telescope.

To pursue the history of the telescope, and trace the improvements made in its construction as each explorer marked its deficiencies and capabilities, would occupy too much space. We may, however, run rapidly over the principal facts in connection with it, leaving those who would become more intimate with the science of optics to fill up the gaps in our narrative from the pages of almost any cyclopædia.

The discovery of the telescope was soon followed by the invention of the microscope, which is attributed to Cornelius Drebbel, of Alkmaer, near Amsterdam, who had probably obtained one of Jansen's telescopes about the year 1600. To Willebrord Snell we are indebted for our knowledge of the laws of the refraction of light, which knowledge was much improved by Descartes, who published a treatise on Dioptrics in 1637, in which the ideas of Snell were popularised—some even say plagiarised. After a variety of delicate experiments, Snell found that "by prolonging the incident and refracted rays on each side of the point where the refraction is made, and drawing any vertical line, the parts of the two rays comprised between the above point and this vertical line, always preserve a constant ratio to each other, whatever the obliquity may be." In 1663 the celebrated James Gregory published still further discoveries in optical science, in which he gave some hints which led to the after invention of the reflecting telescope. In the same year appeared Mr. Boyle's "Experiments and Considerations on Colours," a work "full of curious and useful remarks on the then unexplained doctrine of colours." The discovery of the phenomena called the inflection, or bending from the straight line of light, is due to Grimaldi and Hooke about 1665—72, both philosophers probably making independent discoveries. In 1669 Dr. Barrow gave to the world his *lectiones opticæ*, or lectures on light; and in 1682 the celebrated German philosopher, Leibnitz, published a work on the "principles of optics, catoptrics (reflex vision, as in



mirror), and dioptrics," a work in which the discoveries and speculations of those who had written before him are compared, analysed, and explained.

But we come now to speak of the greatest hero of them all. We have seen that, previously to the time of Newton, the properties of light which had been discovered related principally to its reflexibility, its refrangibility, and the heat which it occasioned when concentrated in the foci of lenses and mirrors, but that scarcely anything had been ascertained with regard to the immediate nature of light itself. It was reserved for our great philosopher to anatomise light and colours, and reveal this grand secret. It has been too usual to refer the date of his principal optical discoveries to the year 1704, when his treatise on optics was first published, but the truth is, that his discoveries in this science constituted the subject of his lectures for the first three years after he obtained the mathematical professorship at Cambridge—that is to say, from 1669 to 1672; that he communicated a synopsis of his interesting discoveries to the Royal Society in February, 1672; that the publication of his letter in the Philosophical Transactions involved him in a controversy with some foreigners, which was so repugnant to his modest and quiet disposition, that he resolved to publish no more on the subject for some time; and that, in consequence of this resolution (so honourable to his feelings, and so unfortunate for science), his book on optics was laid by for more than *thirty years* after it was prepared for publication, and did not make its appearance till 1704, the year above specified.*

Newton's theories gave to the world new ideas of the uses and applications of the telescope. In the year 1670 he constructed and publicly described a reflecting telescope, in which the errors and inconvenience of the coloured rays, and the unequal refraction of light, were first obviated. From his discourses and writings may be traced nearly all subsequent discoveries and improvements of the telescope, and to his energy and perseverance is due almost all that we know of the nature of light.

From the after writings and discoveries of the philosophers Hadley, Short, Bouguer, Dr. Brewster, Dolland, Count Rumford, Wollaston, and Maskelyne, not to mention the profound disquisition of living writers, the world has at last come to a knowledge of the principles of optics—a knowledge more important than our limited space will allow us to enlarge on.

We have thus seen that the latter end of the sixteenth century was the era which gave to the world a power of viewing other worlds which God has hung up in the skies, and which, but for that power, would be, to our unassisted vision, but so many bright specks in the heavens. But for the discovery made by Jansen's children, in the little town of Middleburgh, Galileo, Tycho Brahe, Newton, Herschell, and Professors Arago and Airy would have lived almost in vain, at least as far as astronomical researches are concerned.

ASTRONOMICAL TELESCOPE BY MESSRS. MERZ AND SON, OF MUNICH.

The principle of all telescopes is just this:—By means of a combination of glasses (lenses), the power of the eye to discern distant objects distinctly is increased, by so much as the size of the instrument and the perfection of the lenses admit. All that is effected by a telescope is to form such an image of a distant object, by means of the object lens, and then to give the eye such assistance as is necessary for viewing that image as near as possible, so that the angle of it shall subtend (extend under) at the eye, and be very large compared with the angle which the object itself would subtend in the same situation. This is effected by means of the eye-glass, which refracts the pencils of rays, so that they may be brought to their several foci by the humours of the eye.

The reason why a distant object viewed through a telescope is more distinct than if seen by the naked eye is, that the pupil of the eye takes in a larger number of rays of light than is possible with the unassisted vision, in fact, as many more rays in proportion as the object-glass is larger than the pupil of the eye itself. The object in this case appears as brilliant as if the eye were as large as the object-glass of the instrument. In this paragraph we merely re-state, in somewhat plainer terms, the facts contained in the last. The magnifying power of the lenses used in the telescope may be augmented to a considerable degree, because the focal length of the object-glass, with respect to that of the eye-glass, may be greatly increased. The larger glass is termed the object-glass, and is placed at the end of the instrument furthest from the eye.

* Encyclopædia Metropolitana.

Every visitor to the Great Exhibition will have noticed the large equatorial telescope which stood in the western central avenue. It, together with great improvements and excellence in the other optical instruments, exhibited by Mr. A. Ross, obtained the Council Medal. We give a view, and subjoin a description of this instrument, as furnished by the inventor.

"This instrument is supported on a round cast-iron pillar, 10 feet 9 inches high, the base forming part of the height, is extended to the diameter of 9 feet, the diameter of the bottom of the pillar is 2 feet 3 inches, and that of the top 1 foot. The pillar is in two portions, the joint being 1 feet 6 inches from the bottom of the base. These are fastened toge her by eight screw-bolts and nuts passing through flanges 3 inches aside from the shafts of the pillar. This joint is to obtain an approximate m[illegible] [illegible]. The polar-axis, of cast-iron, is 6 inches [illegible] long, and the flange by which it is connected to the declination-axis is 18 inches diameter. The inner, or male declination-axis, is 3 feet 6 inches between its bearings, and the outer, or hollow axis, is 7 inches diameter, both of cast-iron. The inner axis and its flange is attached, and turns one casting with the central hollow-cylinder, to the flanges of which the corresponding gun metal flanges of the telescope tube (which is of copper) are bolted. The fittings of the declination axis are cylindrical, and it is secured from falling out by a steel ring 1 inches long, fastened by cross pins to the male-axis. There is a counter-sunk cavity in the outer-axis to receive this, and a second counter-sunk cavity of larger diameter to receive a steel plate, which is fastened by eight steel screws against the end of the steel collar. This plate serves to adjust the endshake of the axis. The declination-circle is 2 feet 8 inches diameter, and regulated by an endless screw having an eccentric lever for gearing, also a bevel-gearing at each end of the screw for Hook's-joint adjusting-rods. There are two other radial arms, with clamp-screws, for securely fixing the telescope to the circle after the verniers are set to the reading by means of the endless screw. The upper part of the polar-axis fits into a coupling-block having a hemispherical bottom. This is supported by an annular projection from the top of the pillar, having a corresponding annular hemispherical cavity. The whole is bound together by bolts and nuts, which pass freely through holes in the block, having spherical ends which bear in corresponding cavities in their washers. The other end of the polar-axis terminates in a beam pivot or hardened steel, which bears in a corresponding hardened steel cup which is attached to dove-tail slides, having motions in rectangular directions. These are supported by a very strong bracket projecting from the main pillar. The dove-tail slides are employed in the final adjustment of the polar-axis, both to the meridian and latitude. The diameter of the hour-circle is 2 feet 3 inches, and [illegible] to Professor Airy's plan, which avoids computation [illegible] telescope to a star. The [illegible] is [illegible] [illegible] ration of wheels is regulated by a [illegible] governor—the ball being suspended by four springs, as recommended by Professor [illegible]. This has been wrought by a system which [illegible] radii of curvature of the lenses, and ensures the perfection of the spherical surfaces, the result of the process being determinate with reference to the construction and manipulatory processes."

Telescopes of a superior description to those in ordinary use were also exhibited by Messrs. Mertz and Sons, of Munich, of one of which we also present an engraving and description (page 349).

It is well known that the instruments of the Optical Institute in Munich, manufactured under the direction of Messrs. Mertz and Sons—formerly Utzschneider and Fraunhofer—have been supplied to almost every observatory in Europe. Two instruments of unusual excellence were exhibited by them in the Great Exhibition of all Nations—a small refractor and a microscope. The former is also furnished with a telescope for the discovery of comets, having an object-glass of six inches in diameter, and which, notwithstanding its small focus, gives a clear and distinct reflection of an object at a large magnifying power. On this account it must be appreciated as a most excellent work of art.

The mechanism of the instrument is explained by the accompanying engraving. The oblique axle is regulated according to the angle of latitude, and is therefore parallel with the earth's axis: the circle attached to it gives the right ascension of the star which is visible in the telescope, while the upper circle placed at right angles to it—gives its declination. The angle between the two oblique axles cannot, in this instrument, be varied beyond 30 degrees, and consequently this instrument can only be used between the 30th and the 60th degree of longitude. The workmanship and execution of this instrument is remarkable. Of the microscope we may say that it is a model of optical and mechanical excellence, and that it has a magnifying power of 1800.

The high name which the Munich Optical Institute has gained is certainly not groundless, when giant telescopes at Pulkowa, Newcambridge, Bogenhausen, and Cincinnatti—at Dorpat, Kiew, Kasan, Berlin, and Washington—have done immense service, not to mention the innumerable small refractors of England, Germany, Holland, Russia, Italy, North America, and even the Cape of Good Hope. The Institute is now occupied in completing an object-glass of more than fourteen inches diameter.

From the foregoing brief account of the history and construction of the telescope, it is hoped that an insight will be gained by many which will lead them to further research. It is obviously out of our power to treat of the science of opticsa science which must be studied by aid of diagrams and much practical knowledge—in a short paper like this. Enough of we have alluded to, is but to our reader's knowledge of this noble instrument which

> Scans the sunbeam, pierces the depths of earth,
> And tracks the unwritten charters of the sky.

THE DOG AND DEER OF THE CAMERON HIGHLANDERS

The attachment of dogs to particular bodies of men and their love of music, has often been noticed. The following particulars of a Newfoundland dog and a couple of deer which followed the fortunes of the band of the 79th regiment of Highlanders will not be uninteresting. The introduction to the regiment of this noble animal, for noble and generous it became, the Newfoundland dog assuredly is, was characteristic of the attachment displayed by the commander to the soldiers, and especially to the band. It first belonged to Lieut. Keith Macland of the 79th, who presented him to a gentleman in Quebec, who thought he would get him as a present and used him to draw sleighs, the dog, however, disliking this sort of work and returning to the quarters of the band, and no threats or inducements would cause him to leave them. So determined was the animal to remain with the band, that after volunteering into the band twice, he would fly at him, thinking, doubtless, they might prevent his taking him away. Fortunately, the gentleman never returned for him. The Cape Barracks are, like Stirling Castle, built on a height. If any of the soldiers happened to be out, and got tipsy, the dog, "Cameron," used to attend that individual in preference to all others, and manifest every anxiety to get him into barracks—pulling him by the sleeve, and so on. When it chanced that a soldier fell among the deep snow, the dog redoubled his exertions to get him home. He makes a round of the Castle daily, very often twice in the forenoon and afternoon, calls at the gate, the guard room, the sentinels, &c., doubtless to see that all is right, and they are attending to duty, and, apparently satisfied with his inspection, returns to his own quarters in the band-room. As may be supposed, he is a regular frequenter of the cookhouse, where he is generally regaled with a bone from the cooks, who are all fond of "Cameron." He prefers the quarters and the company of the band, and seems to take delight in the music. When the band stops, he very often lies down like a lion, in their front. A handsome collar is, we understand, now preparing at Edinburgh for "Cameron," the regimental dog of the 79th Highlanders, with a suitable inscription.

Two stags have, at separate times, been attached to the regiment, and both them and the dog preferred the company of the band. The first deer was presented by Colonel Holdridge, of the Royal Engineers, to the officers, about the year 1842, at Gibraltar. It remained with the regiment only for about six

or eight months. In this short time it became much attached to the soldiers, but sometimes caused a good deal of trouble as it used to eat, or at least destroy, the men's belts when they chanced to leave them out. Notwithstanding this, he was a great favourite with the men; and on a field-day, such as the celebration of Her Majesty's birth-day, his antlers were dressed up with green ribbands—the facings of the regiment—and it was interesting to see with what pride he tossed his antlers, and marched with the band to the martial music

One day a Spaniard came up, and having very probably never seen an animal of the same kind before, he displayed some evidences of fear or amazement and ran off, when the stag gave him chase. As he ran, he was heard to call out lustily, "For any sake to save him from the Highlandman's goat!" The stag used always to take his place in front of the band, along with the drum-major. One morning, to the grief of the whole regiment, he was found with his throat cut, among the rocks at Windmill Hill, Gibraltar, in 1843. The Governor, it seems, had another deer, and it was thought they had fought, and that the antler of his adversary had penetrated the throat of their favourite.

The second deer was, in the year 1844, also presented by Colonel Hardinge to the officers, and like its predecessor, gave early evidences of its decided partiality for the head of the Regiment, and on all occasions marched with the band, and attended them in quarters. He used to carry on amusing pranks with the civilians, especially with the vigorous and worthy Moors, to the amusement of the soldiery. He generally fed by the Light Company, chiefly on beans, and for two of the men in that company he showed great partiality, so much so that he would run after them, and follow to the voice. He remained with the regiment in Gibraltar for about eighteen or twenty months. His death was also of an unexpected and tragical kind. A retired sergeant, who held the situation of key-sergeant or locker-up, who kept the gates, &c., was in the habit of going round with an escort, whose muskets were generally loaded. Early, one morning, as he went his usual round with the escort, at Lamport Ditch, Gibraltar, the deer, probably enough in amusement, attacked them, and the sergeant, with but little of the spirit of the soldier in him, ordered the beautiful animal to be shot, which was reluctantly, but with the promptness of military discipline, carried into execution. It is said the sergeant was soon thereafter reduced, and that he ultimately lost his situation of key-keeper. The Hon. Colonel Maude, the officers, and indeed the whole regiment, deeply regretted the death of the animal, which, although a great favourite, fell, as we have related, by the arms of its kind friends and benefactors.

The race of the Newfoundland dog is peculiarly famed for sagacity, and the one who is to have the regimental collar put on him in Stirling Castle, is as great a favourite, and promises to be a worthy representative, in the gallant 79th, of the attached and beautiful animals who have gone before him. Nor can it be forgotten that both the dog and the deer are most appropriate types of, and attendants on, a Highland regiment—the one a free inhabitant of the mountain ranges in the Highlands, swift of foot, and at all times alive against a surprise; yet, when brought to bay evincing the most unbending courage. The other, scorning fatigue, affords fidelity cannot be bribed, and whose determined bravery is such that he master. All of these qualities, we need scarcely add, have been exemplified in the aggregate by our Highland regiments, and in looking on the dog and the deer, we are irresistibly reminded of the heather hills and the fidelity and courage of our soldiers.

HUMAN AFFAIRS.—"There is no unmixed good in human affairs," says the historian Alison, "the best principles, if pushed to excess, degenerate into fatal vices. Generosity is nearly allied to extravagance—charity itself may lead

justice is but one step removed from the severity of oppression. It is the same in the political world: the tranquillity of despotism resembles the stagnation of the Dead Sea, the fever of innovation, the tempests of the ocean. It would seem as if, at particular periods, from causes inscrutable to human wisdom, a universal frenzy struck mankind; reason, experience, prudence, are alike blinded, and the very classes who are to perish in the storm are the first to rush to fury.

VISIONS OF THE NIGHT.

Gentle slumber's sweet oblivion
Softly stealeth o'er each sense;
Dark-some cares and daily labours,
For awhile, are banished hence;—
To the lands of dreams I wander,
Bathe in bounteous floods of light,
And my centred being revels
'Mid the visions of the night.

Back again to joyous childhood,
With one gladsome leap I bound,
And the peals of merry laughter
Thro' the ringing woods resound.
Childish playmates are about me,
Now it altered in my sight,
Childish games have lost their folly,
In the visions of the night.

Or perchance the old companions,
Who were found in youthful years,
Pour afresh their fond assurance
In my all too willing ears.
Early loves and early friendships
Their then sunny sides" to light,
And their *shadows* dare not venture
In the visions of the night.

Or the group that forms "our household,'
Gladdeth noiseless turn my dreams,
Shedding radiance all unwonted,
Murmuring love in very streams!
Lingerings have found an utterance—
Earnest eyes are beaming bright,
While the secret heart revealeth,
In the visions of the night.

Waking life is *too* prudential—
Too reserved in word and deed,
Trusting *not* that honest accents
To all honest issue lead,
But believe me, 'twere more happy,
If with souls attuned aright,
We would drop the veil of *seeming*,
As in visions of the night.

But the breezy morning cometh,
With her thousand wakeful songs,
And I hear the hum of labour,
Which to working life belongs.
May each action be as earnest
And each tone as true and bright,
And its fact is bright a halo
As the *visions* of the night!

LITERARY NOTICES

THE FREEHOLDER AND COMMERCIAL ADVERTISER, *a New Weekly Commercial, Political, and Family Paper, will be published every Monday morning price 4d., or 1s. 4d. per quarter.—On Monday, March 4, will be commenced as a Weekly Newspaper,* THE FREEHOLDER AND

place, by the Organ of the Great Freehold Land Movement. In addition to sporting progress, &c. its pa[illegible] the illustrated with engraved Plans weekly list of the pr[illegible] rights for allotments, the improved value of allotments, the pric[illegible] allotments have been sold on different estates, notices of Building, Life Insurance, and other Societies for the promotion and encouragement of pr[illegible] dent habits, &c. But while these and similar topics will have due space—

*II.—*THE FREEHOLDER AND COMMERCIAL ADVERTISER *will form a complete guide as to the occupation of allotments, whether by sub building, or for cultivating, or other agricultural purposes.*

III.—As a Commercial Paper, it will prove to be one of great importance and value to the trading community, not only as it will present a faithful

of all the Monday's Markets up to the time of going to press.

IV.—Although THE FREEHOLDER AND COMMERCIAL ADVERTISER *will be the Organ of the Freehold Land Movement, it will be a Liberal general Newspaper, independent in principle, and will exert itself to the utmost to bring the Elective Franchise within the reach of every industrious and virtuous citizen.*

Order of any Newsvendor.—Office, 335, Strand.

MISCELLANEA.

THE Chinese have a saying, that an unlucky word dropped from the tongue cannot be brought back again by a coach and six horses.

BAIN'S ELECTRIC CLOCK.—Few contrivances can be more remarkable than Bain's electric clock. It has no weight, no spring, no escapement, no winding apparatus nor necessity for being wound up, no agency within itself for putting or keeping the hands in motion The invisible power which actuates it is outside the clock—outside the house, even in which the clock is contained In a garden or other piece of ground is dug a hole four or five feet deep, into this hole is thrown a layer of coke, then a layer of earth, and then a few zinc plates A feeble but constant galvanic current is generated by the contact of the earth with the coke below it and the zinc above it, without the aid of any other battery, and this current conveyed in doors by copper wires The wires form a coil round a magnet, and the electro magnet thus formed is made to constitute the bob of the pendulum of the clock Delicate and beautiful mechanism enables electric apparatus to give a vibratory motion to the pendulum, and the pendulum in its turn to give motion to the two hands of a clock The only "winding-up" required by this extraordinary clock is a feed of zinc to the earth battery when it shall have become oxidised by long use, but one of the clocks has been already known to go three or four years without any such winding-up This is not a "perpetual motion," certainly, but it is a most instructive approximation towards

SABBATH AT ALL TIMES By differ at nations every day in the week is set part for public w Christians, Monday by the Greeks, Tuesday by the Persians, Wednesday by the Assyrians, Thursday by the Egyptians, Friday by the Turks, and Saturday by the Jews. Add to this the fact of the diurnal revolution of the earth, giving every variation of longitude a different hour and it becomes apparent that every moment is Sunday somewhere

OUGHT TO BE ENCOURAGED.—An American paper says—"We are anxious to collect the autographs of all our subscribers, and therefore request all, whether in city or country, to enclose the amount due in a letter, with their several signatures."

OUTWARD BEAUTY.—"I cannot understand," says Frederica Bremer, the popular Swedish writer, "the importance which certain people set upon outward beauty or plainness I am of opinion that all true education—such, at least, as has a religious foundation—must infuse a noble calm, a wholesome coldness and indifference, or whatever people may call it, towards such like outward gifts, or the want of them And who has not experience of how little consequence they are, in fact, for the weal or woe of life? Who has not experience of how, on nearer acquaintance, plainness becomes beautiful, and beauty loses its charm, exactly according to the quality of the heart and mind? And from this cause I am also of opinion that the want of outward beauty never disquiets a noble nature, or will be regarded as a misfortune It never can prevent people from being amiable and beloved in the highest degree, and we have daily proof of this

ANSWERS TO CORRESPONDENTS.

A WORKING MAN is desirous of obtaining a daguerreotype portrait of a dear friend, and asks us to teach him how the process is conducted We refer him to an interesting article on photography which appeared in No 7 of "THE ILLUSTRATED EXHIBITOR AND MAGAZINE OF ART."

[illegible] correspondent goes on to ask—What is the [illegible] of metal rusting? What is the cause of [illegible] opposition? Why does one thing [illegible] a particular [illegible] it? If it is owing to the particular [illegible] which are generated? If the same smell will be produced if those gases are brought together by any other means? If not, why not? What is the cause of a human body beginning to decompose as soon as it is dead? Really, our correspondent must have pity on us so [illegible] crooked little things asking questions in one letter [illegible]

C O wants to k [illegible] Wales to get a situation in a London countinghouse He would not be likely to succeed without some good introduction and the salary would very much depend on his own capability With regard to the second query, we cannot undertake to give medical advice

R H asks what is the proper method of obtaining a patent—how is an invention to be registered—and what is the expense attending each process The expense is enormous There are five and thirty stages to be gone through before you can get your patent You begin with the Queen and the throne and end with the Deputy Clerk [illegible] hundred pounds of stamp [illegible] and it is surely no very great encouragement to the inventive genius of our country If R H is in earnest, he must prepare a petition to the Queen, and add to that a declaration which must be made before a Master in Chancery

J WIGNALL JUN.—"Robertson on Life Assurance," London, Simpkin and Marshall Price 3s 6d

A MANXMAN.—The Isle of Man is most probably the "Mona" described by Cæsar as being in the middle passage between Britain and Ireland It is called, in the language of its ancient inhabitants "Ellan Vannin"—the Isle of Man The word "Mona" is supposed to have been originally "Mon"—isolated or lonely—Cæsar having [illegible] present arms of the island—three legs proper united at their thighs, and clothed and spurred—is somewhat uncertain, but the account that the inhabitants of the island are of mixed race of Britain, Scotland, and Ireland, it has an equal right to perplex us much The legs being armed not *self defence*, and their position *spread* But it may also be observed that, whichever way you turn them two of the legs present the nearest a knee [illegible] position, and the third as in the act to kick the *rest* of which is, that, while the relative impossibility of action she was also able to defend herself Her motto is an Icelandic Dimeter—"*Quocunque loceris Stabit*"—"Which-ever way you throw it, it will stand" It appears extremely welcome to the style and intention of the arms is in whatever way you transpose the three words, their meanings is the same for, view the [illegible] the whole The occult meaning of the arms of the Isle of Man is regarding with late the attitude imply, humility, energy, and fortitude, and the motto being remarkably significant when this country consisted of three independent kingdoms The arms and motto are still used on the coin of the Island

S G—Is the sabbath kept with that propriety and strictness in the United States as it is in England?—Yes

PERRY is anxious to acquire a knowledge of short-hand and asks us to recommend the best [illegible] we know of—He cannot do better than practice phonography for simplicity, accuracy, and completeness we think it far beyond all other methods. A very good little book on shorthand is published by Odell, Prince-street, Cavendish square at 1s The Latin grammar you mention though not quite equal to Arnold's, is a [illegible] ied that, [illegible] know, the manufacture of [illegible] injurious to the health.

A COUNTRY FRIEND had better obtain Nuttall's French Dictionary It may be obtained for [illegible]

H. HARBORD.—The third volume of the History of Ireland will be published on the first of March This answer will also inform Grantham Giddey.

W. K. T.—To the first question we can give no reply, as we are not parties to the patentee's secret Sperm oil is obtained from the blubber of the spermaceti whale. The Supplementary number of the Working Man's Friend is still published in its old form.

A LABOURING MAN will see by the answer to H Harbord that it is our intention to publish a third volume of the History of Ireland. We thank him sincerely for his good wishes

J C—No, we think not. But a water company is not obliged to supply you unless it chooses

A FARMER'S SON is recommended to try again. [illegible] wish

J W should read Paley's Evidences, and Doddridge's Commentaries on the New Testament

W. W. M—The better method would probably be to make the scholar so far acquainted with his own language as to be able [illegible] ming to spell the words, before you attempt to teach him the principles of punctuation

JOHN TRADDELL is thanked, his valuable suggestions shall be borne in mind.

T H—1 For want of means 2 Age and [illegible] unsteadiness of body 3. The matter is under consideration 4 The "Illustrated Exhibitor" *will* form half-yearly vol

WILLIAM MARCH puts a q[illegible] would better form a "case" for

A[illegible] Arabi[illegible] introduced into Spain whence it came to England, and that before the Greek writer Diophanes, published his system, which appeared about the year 800 of the Christian era The science may be defined as a general method of [illegible] divided into two kinds—viz., *numerical* and *literal Numeral algebra* is that wherein all the given quantities are represented by *numbers*, only the unknown quantity expressed by some *letter* or other *symbol Literal algebra* is [illegible] ressed by

MALT AND HOPS.

BACCHANALIAN SHIELD.—M. KRAUSZ, OF ROSACH, GERMANY.

IF a magistrate were asked to say, in three words, what brought the greatest number of persons before him, his answer would be "Malt and Hops;" if a doctor were requested to inform us what causes the majority of diseases among his patients, he, too, would reply, "Malt and Hops," or, if he were as conscientious as he is clever, he would, probably, use the word "alcohol" instead, and if the undertaker really acknowledged his best friends, in a worldly point of view, he would hang a

personification of malt and hops over his chimney piece Malt and hops, most potent of good fellows in the estimation of some, are, to the comprehension of others, a pair of red-nosed, noisy, rattle-pated, swaggering sots, whose room is better than their company. Which is the better conclusi

The Germans have the character of being a thoughtful, meditative people, much given to tobacco and philosophy. Generally they are sober people too, but among them, more especially among the young and the inexperienced, the student and the man of the world, there are not a few inveterate beer-drinkers and wine-bibbers. The word beer is the same in their language as in ours With them, therefore, as with us, there are songs and pictures- noisy, table-thumping, uproarious, chorus-exciting songs, and jolly, highly-coloured pictures—in praise of the delights of tippling Thus, too, they as well as we have the

nectar," "good-bodied stout," "fine pale ales,' and a hundred others, no doubt familiar to our readers, in which the drinking practices of mankind are excused, if not actually approved, and thus society has come to countenance a vice more destructive in its consequences than it is willing to admit.

In the great Exhibition of all Nations, there appeared, among other curious things from Germany, the cast of a shield representing a bacchanal—called in the catalogue, Gambrinus —and the effects of drinking Now, as the effe temperance are, unfortunately, not confined to any one country, we thought a good purpose might be served by giving a representation of this drunkard's shield Let us examine it In the centre, standing beneath a kind of archway, which may be considered as the entrance to the beer cellar, is the deity of strong drink, the personified representation of malt and hops. He is represented as a lusty fellow, with a long beard and a protuberant belly, showing that beer at least fattens if it does not strengthen the drinker His head is crowned with hop leaves, in his right hand he bears a foaming glass, and in his left a little hop pole, round which the tendrils of the plant are clinging. Beneath him is the copper wherein the ingredients of the beer are boiled together, the steam from the chimney of which rises upwards, and conceals the lower part of the bacchanal Just above the copper, on the right-hand side, we see the demon of Despair squeezing the oil of madness into the drunkard's cup, while opposite to him is the little god of Mischief exulting in the success of the other's endeavours On the front of the copper itself a pair of figures are engraved, the one representing Folly bestriding a broomstick, and the other Senility bearing a withered branch upon his shoulder The arms of the beer drinker are, as they should be, at the top of the shield. They consist of a wash tub properly surmounted by a barrel and pail. The supporters are a goat and a barking dog, the emblems of lust, irritability and danger Between the feet of the animals appears the crest of the set, a sick cat with a bruised face'

The pictures round the shield are intended to show the effects of beer drinking On the left-hand side we have a peasant vainly endeavouring to persuade a maiden to accept his love, and offering a full pot of the liquor as a further inducement in his behalf But the maiden is putting out her hand towards the fatal draught as if she wished to banish it for ever from her sight. He who would win her heart must have better claims than those

On the other side we have a company of workmen making merry at the alehouse. The centre figure sits astride a beer barrel, and trolls forth a roaring drinking song, in which the others join in chorus—the song of fools.

> Out of the tavern I've just stepped to night
> Street! you are caught in a very bad plight
> Right hand and left hand are both out of place—
> Street, you are drunk, 't's a very clear case

"

> Moon, 'tis a very queer figure you cut
> One eye is staring, while t'other is shut.
> Tipsy, I see, and you're greatly to blame,
> Old as you are 'tis a horrible shame

> Then the street lamps, what a scandalous sight!
> None of them soberly standing upright,
> Rocking and staggering why, on my word,
> Each of the lamps is as drunk as a lord.

> All is confusion. now isn't it odd?
> Nothing is sober that I see abroad
> Sure it were rash with this crew to remain
> Better not go to the tavern again.

In contrast to this roystering company, we have below them, in the next department, a fresh-coloured youth, who is bidding adieu for ever to the alehouse and its foul delights. He is setting out, staff in hand, upon the pilgrimage of life, and begins his journey with a good resolution. On the other side of the shield we see the old publican with the empty beer-vessels beside him, sleeping off the effects of then too potent ' ' pi ' ' of time wasted and talents misapplied. That there should be wanting no incentive to drink, the aid of music is called in, and to the sound of fife and fiddle the poor of intemperance drink away their senses, till, at the close of the "glorious evening," they quarrel and fight, as seen in the last compartment of the shield.

Around the whole composition there is a border of hop blossoms and leaves intertwined, with the broad leaves of the tobacco plant in the centre, emblems of sensuality and stupidity.

This is the German view of malt and hops, and a tolerably correct one it is But there is also an English one, which is no like and so true, that we are tempted to quote it. The lines to be found in the fourth book of Cowper's "Task."

> Pass where we may, through city or through town,
> Village, or hamlet, of this merry land,
> Though lean and beggar'd, every twentieth pace
> Conducts the unguarded nose to such a whiff
> Of stale debauch, forth-issuing from the styes,
> That Law has licens'd, as makes Pemp tance feel
> There sit, involv'd and lost in curling clouds
> Of Indian fume, and guzzling deep, the boor,
> The lackey, and the groom the craftsman there
> Takes a Lethean leave of all his toil,
> Smith, cobbler, joiner, he that plies the shears,
> And he that kneads the dough, all loud alike,
> All learned, and all drunk! The fiddle screams
> Plaintive and piteous, as it wept and wail'd
> Its wasted tones and harmony unheard
> Hence the dispute whate'er the theme, while she,
> Lull Discord, arbitress of such debate,
> Perch'd on the signpost, holds with even hand
> Her undecisive scales. In this she lays
> A weight of ignorance, in that of pride,
> A ' ' ' ' ' ' ' the eternal poise
> ' ' ' ' ' ' '

but perhaps we speak too generally. The sixty years that have passed away since Cowper wrote them have seen arising in the world a new power—a great and wonderful principle—a truth acknowledged from throne to cell—the power and principle of strict sobriety But to return to the words at the head of our paper—

Are Malt and Hops, in the shape of beer or ale, good or necessary to the health or comfort of the people? We believe not, and we will give our reasons for believing so.

We spoke of a magistrate's experience as tending to prove that drunkenness is the prolific parent of crime. Who doubts it, let him give us his attention for a little space "Wine," says Caleb Stukely, in *Blackwood's Magazine*—and by wine, we believe, he meant all intoxicating liquors, including malt and hops, as a matter of course—"wine, whose praises are clamorously rung around the festive board, and whose virtues supply the song with brilliant thoughts and ardent syllables, what need of eloquence and verse to sound the same, whilst murder and seduction bear ghastly witness to thy potency!" Is there a greater crime than these? Name it, and drunkenness shall claim it for a child!" The novelist is no magistrate, but he appears to have been an excellent judge Again, Chief-Justice Maule, addressing James Ford, who was convicted of murder at Chester in 1843, says—"Your offence—*like most of those we have met with in this court*—was brought on by excess and intemperance." Mr. Wontner, the governor of Newgate, declared that, out of every hundred prisoners confined in that gloomy prison, ninety nine committed their crimes whilst under the influence of drink Sir Matthew Hale has given it as his decided opinion, that "if the murders, robberies, riots, adulteries, and other enormities, were divided into five portions, four of them would be found to be the result of excessive drinking" The celebrated Judge Erskine, when sentencing a gentleman to six months' hard labour for a crime committed during intoxication, declared that ninety-nine cases out of every hundred arose from the same hateful cause. Judge Pattison, addressing the grand jury at the Norwich assizes, said, "If it were not for strong drink, you and I would have nothing to do." and Justice Coleridge, at Oxford, remarked that no single case had been brought before him of a prisoner charged with the commission of offences, but what the love of liquor has had to do with it, in one way or other Baron Alderson, when addressing the grand jury at the York assizes in 1841, Judge Wrightman, in his address to the jury at Liverpool, in 1846, the Hon A Alison, sheriff of Lanarkshire, Mr Sheriff Bell, of Glasgow—have all and severally declared that they were satisfied that nine-tenths of all the crimes committed in this country were referrible to the influence of intoxicating drinks And so we might multiply evidences from the mouths of the highest personages in the realm.

But to take another class of witnesses against the drinking practices of Great Britain Dr Buchan, a most undoubted authority, declares that "malt liquors render the blood sizy and unfit for circulation." Think of that, ye fat beer-bibbers! He goes on to say, that there are "few great beer-drinkers who are not phthisical (that is, wasting by disease), brought on by the viscid and acescible nature of strong ale. Those who drink acid spirits or wine, run still greater hazard, as these liquors inflame the blood, and tear the tender vessels of the lungs to pieces" Dr Beddoes says that vinous liquors—that is, all kinds of fermented and intoxicating drink—acts as a two-edged sword. By its first operation it promotes indigestion, and its second depends on its change into vinegar, which change, wine, however genuine, always undergoes in the stomach Dr John Pye Smith gives it as his firm conviction that alcoholic liquors, instead of imparting strength and vigour, as many foolishly suppose, only urge and stimulate to a more rapid and vehement outlay of power, just as spurring whipping a horse does not increase his capability of working. Dr. Garnet declares that the idea of wine or spirituous liquors assisting digestion is false, and that pure water is the only drink necessary for man or beast. Dr Cheyne, Dr. Rush, Dr M'Nish, and numerous medical men in the United States, the result of their extensive experience, that spirituous liquors are unnecessary, hurtful, and dangerous to their [illegible] that the use of them produces diseases in the body to which there had appeared no previous tendency; that the drinkers of malt liquors are especially liable to apoplexy and palsy, and sudden death, that danger lurks in every cup, and death is concealed in the bottom of every tankard, that instead of invigorating the system, the use of alcohol—take it under whatever name we may—disguise its effects as artfully and as carefully as we may—excuse ourselves as cleverly as ever we may—assists, nay, even promotes, the great majority of diseases to which mankind are subject, and that in numerous instances it is the sole and only cause of premature old age, idiotcy, madness, and death!

These are very serious opinions, and we do not well to neglect their warnings

Take another phase of the subject The lovers of malt and hops are fond of saying that beer and ale are good for the health and spirits Are they? Let us glance at a few of the vile things they use to *improve* these favourite beverages The brewers themselves admit the existence of various drugs and nauseous ingredients in their beer, the offices of which are to produce the necessary intoxicating qualities. In one pot of "heavy," most worthy and jolly swilltub, you can have a taste of capsicum pepper, cocculus-indicus (*poison*), liquorice juice, sulphate of iron (*copperas, poison*), salt of steel, nux vomica (poison to rats), opium (*poison*), green vitriol (*poison*), alum, tobacco-water and salt, which are severally used to give a false appearance of age, smartness, colour, bitterness, pungency, or a fine head to the delicious draught "Ah! but," says the lover of malt and hops, "I will take the regular home-brewed instead the real old English October I'm fond of old customs, and like to see in the kitchen of the labourer nothing better than the good old fare of our forefathers, the flitch of bacon, the barrel of flour, the home-made bread, and the cask of strong ale" "Be careful, my friend, lest the cask of strong ale do not swallow up all the rest," we think we hear some staunch abstainer exclaim. But, if even you drink "home-brewed," and brew it yourself, using nothing but fine malt and hops, still you cannot prove that you derive any good from the draught It does not impart strength, because it *injures* the digestive organs, it does *not* quench the thirst, as water does, because it induces you to drink when you are *not* thirsty, it does not improve the health or appearance, but *produces* undue corpulency, which is a disease, and a dullness of mind, which finds gratification only in sensual indulgences Drink your draught of "home brewed," my friend after this, and be happy over it if you can!

Taking a lower [illegible] still, the mere money value of temperance, see, oh [illegible] of John Barleycorn, how heavily you tax yourselves that you may emulate the hog in its grossness, and the goat in its sensuality You actually paid, in the year of our Lord eighteen hundred and fifty, no less a sum than £121,702 3s as a duty to Government on hops alone You wasted not fewer than 43,107 acres of rich land in that one year in the cultivation of 18,537,669lbs of this useless weed You consumed, or rather destroyed, in the making of sixteen million, eight hundred and forty six thousand barrels of beer, good corn enough to feed a nation—to wit, forty one millions, five hundred thousand bushels of malt Oh! ye unconscionable tipplers

Did it do you any good—all this guzzling, I say? Did the beer you drank, besides the 2,900,000 gallons of rum and the 1,800,000 gallons of brandy and the 25,850,000 gallons of gin, whisky, and other British compounds, which you poured, all hot and fiery, down your throats—improve your health, make your homes more comfortable, quench your thirst, or fill your pockets? Ask yourselves that, when you go next to the White Swan or the Jolly Beggars, and it strikes us forcibly you will pause before you spend your customary sixpence Did all this drinking improve your health? "Well," say you, "I don't see that it did **me** much harm." Did it not? You are wrong, my friend, just a little wrong in [illegible] of yourself, as you may see by the facts and figures prepared for your especial benefit Facts and figures, my friend, there is no getting over them.

"*If there be anything in the usages of society calculated to shorten life, the most powerful is certainly the use of immoderate drink*" These words form the conclusion to which Mr. Neison, the actuary to a well-known assurance office, and the author of a work called "Vital Statistics," has come to, after [illegible] having made various strict and minute [illegible] the ratio of mortality among the different classes of society He gives the

average length of life, after the commencement of intemperate habits,

Among	Beer-drinkers	24·7 years
„	Spirit-drinkers	16·7 „
„	Drinkers of both	16·1 „

Therefore, drink away; you have only one-and-twenty years to live, at most.

But our author goes further than that; for he shows the average duration of life among different classes of persons after they have commenced a course of intemperance.

THE HOME OF THE PARLOUR TIPPLER.

Among	Mechanics, working, and labouring men	18 years
„	Traders, dealers, and merchants	17 „
„	Professional men and gentlemen	15 „
„	Females	14 „

"These curious and remarkable results," Mr. Neison goes on to say, "exhibit a rate of mortality for which the most careful observers will be generally unprepared. When intemperate lives are occasionally accepted by life-offices, the rates of premium charged by them fall greatly short of what would be indicated by the figures; and it is to be feared that a careful examination of their experience must show that the arbitrary mode by which such peculiar risks have been estimated has led them into unprofitable speculations. Throughout the whole range of the inquiry, it will be seen that the rate of mortality is frightfully high, and unequalled by the results of any other series of observations made on any class of the population of this country. Sanitary agitators have frequently excited alarm about the wholesale havoc in human life going on in the badly-conditioned districts of some of our large cities; but no collection of facts ever brought under attention has shown so appalling a waste of life as is exhibited in the tables I have given."

See, now, that you pay for this indulgence not only by disease and poverty, but that it actually shortens your lives, oh, devotees of Bacchus! Is it not a serious thing to think that for every sovereign you spend in spirits, you pay fourteen shillings to the state; and that for every twenty shillings you lay out in tobacco, sixteen of them go to support the revenue! Put away the filthy weed, and the filthier glass, my friend, and you will save the tax.

The money spent in strong drink, the sacrifices to the shrine of Malt and Hops—what will it not buy? Just calculate what a penny a-day will do for you. For a penny a-day you may insure your life for the sum of sixty pounds—a sum which would not leave your wife dependent on the parish were you taken away from her; a penny a-day will provide for the little boy, now dancing on its mother's knee, a little fortune by the time he is twenty-one—fifty pounds to go into business with; a penny a-day will induce you to save more, and when you find that you can do as well without your glass and your pint, you will begin to think that you can do without

mother.' 'Would'st like to go John,' she replied, 'then I'll stand treat.' She put her hand up the chimney, and from beneath a loose brick drew forth an old stocking, from which she poured three hundred and sixty-five three-pences, the sum reserved for her daily pint of ale. They had their holiday, and the husband, touched with his wife's conduct, declared that as she had not had her ale he would never touch that beverage again. They began to save, and took a small shop, which grew into a large one. In its turn this expanded into a factory, the factory became doubled and trebled, and people began to talk of this man's carriage, and his country house;

THE HOME OF THE BEER-SHOP SOT.

any at all; and so you will become a respectable member of society. Listen to a little story recently told by the Rev. J. B. Owen, in the Town-hall, Birmingham.

"A working man in the north of England married a factory girl. After their wedding, both of them went to work, and the wife stipulated that out of her earnings she should have a pint of ale daily. The husband consented, and consequently she had her pint—he, his quarts. The anniversary of the marriage-day arrived, and John, looking ruefully at his wife, exclaimed, 'If it were not that I hav'nt a penny in the world, lass, we'd have a holiday, and go to yon village to see my

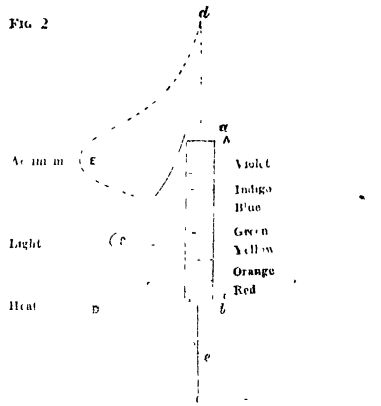
and he rode in his carriage at last, the honoured Mayor of one of our principal manufacturing boroughs.

Now, there is an example for you; go thou and do likewise. My friends, let us be serious; let us look the evil in the face like men. During the present century, there has been spent in intoxicating liquors almost as much money as would have paid the National Debt twice over. In this good city of London there are 180,000 gin drinkers, who spend annually upwards of three millions of money in that one kind of liquid fire. The gin-shops, as you all knew, are greater in number than the bakers or the grocers. Make up your minds, and

put the money that you waste in drink into your own pockets, instead of into the of those publican or the state. Look round among your acquaintance. We will presume that you are a sober man yourself. Well, you are a sober man only in part; put away the temptation altogether, and when you have earned a right to be critical—look round, as we said, among your acquaintance, and see what havoc strong drink is doing.

Take a peep into your late friend Robert A. B. C.'s bedroom, as he goes into it half drunk, very late at night, or very early in the morning, as the case may be. The artist has attempted to delineate such a home as your friend, the parlour tippler has. Bob is a capital companion a jolly fellow, a "regular brick;" at least his companions all say so. He sings a good song, can make a neat speech, dresses well, and smokes the most undeniable Havanas. Bob is an acquisition to the tavern parlour, and is on terms of intimacy with the landlord—there's no getting on at all without Bob. But is he a good husband, or a good father, or a good man? If he were he would not leave his poor wife and sick child alone all the long winter evenings, while he makes merry in a pothouse. Faugh! How the fellow stinks of stale ale and tobacco. Cut his acquaintance, my friend, as soon as you can, and don't return his nod in the street till he reforms altogether. Such companions will do you no good, take my word for it. From respectability to poverty, from moderation to sottishness, from the parlour to the taproom, from virtue to vice, from temperance to drunkenness is but a step. How narrow the step and how small the space between the state of the parlour tippler and the beer-shop sot. Be careful how you make it.

LECTURES TO WORKING MEN



PHOTOGRAPHY

On Monday, February 23rd, Mr. Robert Hunt, Professor of Natural Philosophy, delivered a lecture on this interesting subject at the Museum of Practical Geology, Jermyn Street. The lecture commenced with expressions of regret that the term Photography did not accurately express the true nature of the art he was about to illustrate. Photography means, *writing or delineating by light*—a term which would be applicable if the whole of a ray of light acted to produce the effect, but as the researches of science have shown that only one part of the sun's ray is called into action in the exercise of the art, it would have been preferable to have employed the term heliography—*written or delineated by the sun*—as given to this art by M. Niepce. Custom has, however, sanctioned the employment of the term photography, which is, therefore, used to denote the subject of the present lect

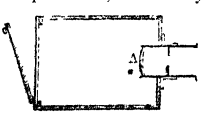
Mr. Hunt then proceeded to describe the solar spectrum—the discovery of Sir I. Newton, who found that when a ray of white or colourless light was made to pass through a prism of glass, it became decomposed or divided into seven colours which are more distinctly perceptible if we place the prism in a hole in the window-shutter of a darkened room, and receive the impression of the spectrum produced on a sheet of white paper placed in the room. The following diagram shows the ray of light entering the room, and which, but for the refracting or bending power of the prism would pass direct to the spot w without suffering any alteration, but which, in passing through the prism, becomes decomposed into the seven so called prismatic colours. Further researches led to the establishment of two

other colours, the one, called the extreme red, represented by *b* at the extremity of the red ray in the next diagram, the other,

shown at the upper part of the violet ray, called the lavender. Sir David Brewster has, however, most satisfactorily shown that there exist in reality only three prismatic colours, blue, yellow, and red—these producing, by combination with one another, the violet, indigo, orange, and green—as secondary colours. By means of the above diagrams the lecturer proceeded to point out wherein consisted the difference of the colours and in various parts of the spectrum. It is found by means of a thermometer, that the heat we get from the sun resides in the lower or red portion of the spectrum, as is indicated by the more curved lines at B—the greatest amount of heat being found in the extreme red. We also find that the light obtained from the sun has its seat spread over the curved lines from C, but that its chief point is in the yellow colour, as above shown. Lastly we find, that, by placing a piece of paper, moistened with a preparation, such as a salt of silver, readily affected by the sun's rays, that the part of the spectrum which has most influence in producing chemical changes or effects is comprised in the lines proceeding from B—the greatest change being effected at the violet colour, the piece of prepared paper turning quite black at this point, whilst at the yellow part of the spectrum it remains unchanged and unacted upon. It will thus be seen that in the exercise of the art of photography, we have to do chiefly with that part of the solar spectrum which produces chemical changes, or, in contra-distinction to heat and light, *actinism* * We also see that the results of photography are effected not by light, or the luminous principle of the solar ray, but of the other principle associated with light and heat in those rays.

It was in the year 1556, that chloride of silver, or horn silver as it was then called, was first observed to be blackened by exposure to the sun's rays, and other peculiar influences which the alchymists noticed led them to fancy that the subtle element Light was one of the most important agents in giving to nature her infinite variety of form. They thus considered that "gold differed from silver in nothing but in having the globules of the mercury, whereof it consists, penetrated through and through, and being more fully saturated with the sulphurous principle, or the 'rays of light.'" It was reserved for Scheele, a native of Stralsund, in Swedish Pomerania, to analyse the action and study the influences of the differently coloured rays of light. He discovered that the chloride of silver spread on paper was speedily darkened in the blue rays, whilst the red rays produced but very little or no change. M. Berard, Sir H. Englefield, and others, made some further researches on the subject, but it was Mr. Wedgwood, the celebrated porcelain manufacturer, who first turned the discovery to any practical account. Mr. Wedgwood wished to take copies of painted windows in

* Derived from the Greek word, *actus*, a ray



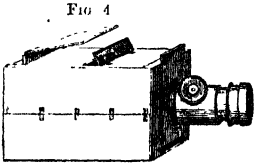
churches, &c., and for this purpose he made use of white paper, or white leather, moistened with a solution of nitrate of silver By placing paper so prepared against a window—the subject of which he wished to have a copy—he succeeded in obtaining a perfect representation, but the reverse of the original, as regards light and shade—the light parts of the window allowing of the free passage of the light, which produced a darkened effect on the prepared paper, whilst the coloured parts, not allowing of the passage of the light so readily, appeared light in the copy taken This, in fact, was a negative proof, as we should now term it. Notwithstanding that Wedgwood had secured the able assistance of Sir Humphrey Davy, he could make no further progress in the matter The copy of a painting, or the profile, immediately after being taken, was obliged to be kept in a dark place, and could only be looked upon by stealth, as it were, or by candle-light The reason of this will be evident, when we consider that what light had once done it could again effect, and the exposure of one of Wedgwood's pictures to daylight, would have been to produce a further alteration of the light parts of the picture the whole ultimately becoming black All attempts made at that time to fix or protect the picture from the action of solar light entirely failed, and the failures of these two eminent men discouraged all further experiments at that time (1802) in England

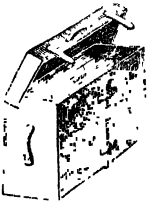
In 1814, M Niepce, of Chalons-sur-Saone, in France, commenced his investigations on the subject of the chemical agency of light, with the view of fixing the images obtained by the camera obscura In 1824, M Daguerre began a series of experiments, with the same object in view In 1829, Messrs Niepce and Daguerre agreed to work together on the subject, each communicating to the other the results hitherto obtained by them M Niepce died in 1833, when his son joined Daguerre in his investigations The result of these researches was, that M Daguerre discovered, in 1838-9, the method of obtaining pictures on metallic plates, and of so fixing them that they might be exposed to the light of day without undergoing any alteration

In 1834, Mr. Henry Fox Talbot began some experiments, with the view of rendering the images of the camera obscura permanent, and on the 31st of January, 1839, six months prior to the publication of M Daguerre's process, Mr Talbot communicated to the Royal Society, a method of taking sun pictures on paper, with the mode of preparing the paper, and using the pictures obtained Some of the pictures first obtained by Mr Talbot were then exhibited by the lecturer

The learned professor then proceeded to speak of the camera obscura, the darkened chamber or box the invention of Baptista Porta The simplest form of camera that can be used, is a common cigar-box, blackened in the inside, with which, and a spectacle-glass for a lens, the lecturer stated he had himself taken a great number of pictures. The annexed engraving represents the camera in its simplest form, it is merely a common box,

FIG. 3





painted black in the inside, having a glass lens placed in a hole cut in the front part—the hinder part being placed on hinges, to allow of its falling back to receive the prepared paper, glass, or metal plate, to be acted upon The light [illegible] external object, in passing through the lens, gives a [illegible] representation of that object on the back of the camera Some of these cameras are made of mahogany and other expensive materials, but this is not requisite, serving only for ornament, not for real utility A very good lens may be purchased for a few shillings at any respectable optician's. *Achromatic* lenses are the best, as by the use of these we are enabled to obtain pictures free from the coloured rays or fringes which are apt to show themselves in pictures taken with a common lens The term *achromatic* means *free from colour*, and this kind of lens is made by combining together, as the lecturer showed, two different glass lenses—as for instance, one of crown glass, and another of flint glass, whereby the coloured rays (as shown in the diagram of the spectrum), formed on the passage of light through one lens, are again united, or brought back to form the original white or colourless light, by being made to pass through a second lens of a suitable kind

The annexed diagrams exhibit one of these highly-finished cameras, so constructed, that it may be taken to pieces and packed up with all the necessary articles used (such as prepared paper, glass plates, &c), in a leathern case, thus forming a very portable photographic apparatus, which the traveller may take with him on his journey, and employ in delineating the scenery [illegible]

FIG. 5.

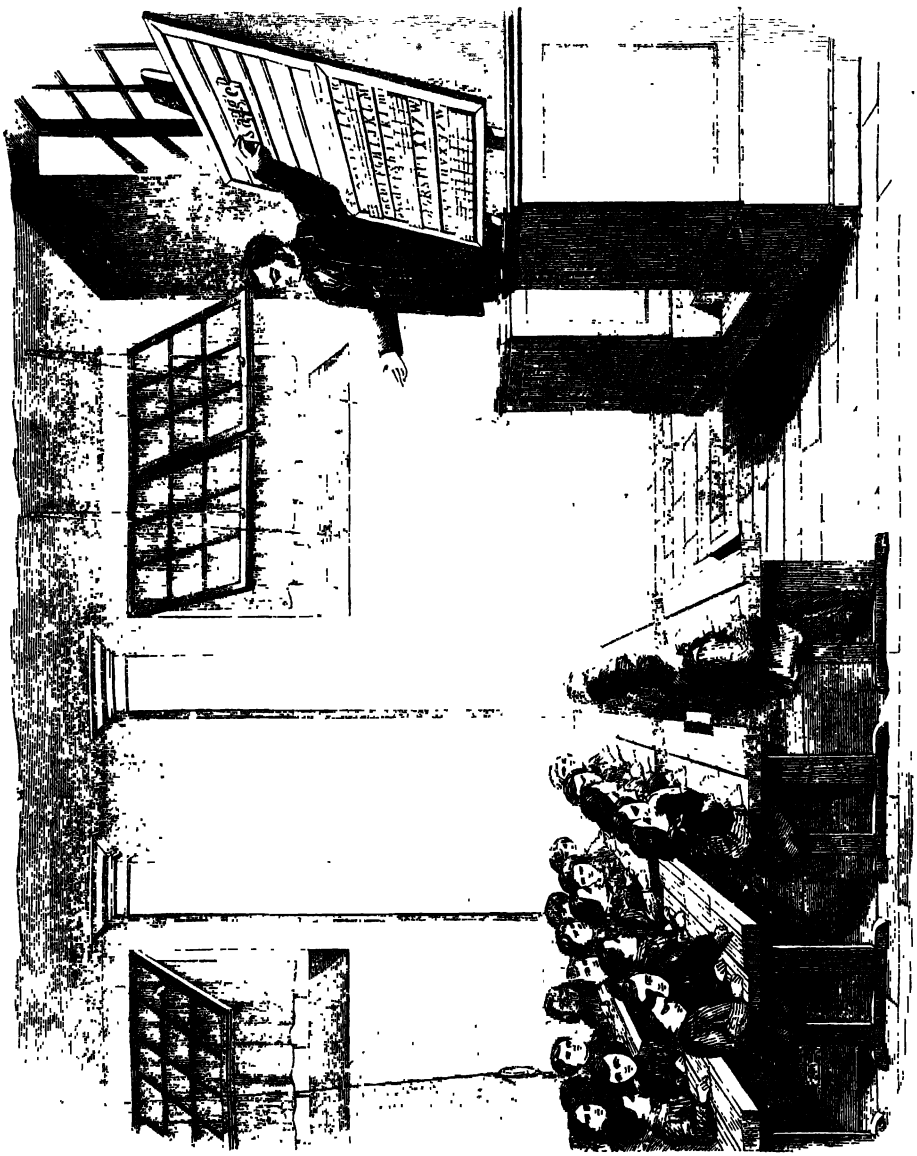
FIG 4

Landscapes, drawings of plants, sketches of machinery, portraits, &c &c, may readily be taken by means of this simple instrument, the fixing of which is neither difficult nor expensive

The lecturer then proceeded to give some explanation of the mode of preparing the paper for photographic purposes, impressing, once for all, on the attention of his auditory, the necessity of paying particular care to the greatest cleanliness in all photographic experiments The method first employed was that of dipping a piece of paper in a solution of common salt, and afterwards in a solution of nitrate of silver, by which means a chemical decomposition or change took place, as represented in the annexed [illegible] in the formation on the surface of the paper of [illegible] chloride of silver —

Common Salt, or Chloride of Sodium.

Nitrate of Soda } { Chloride of Silver.



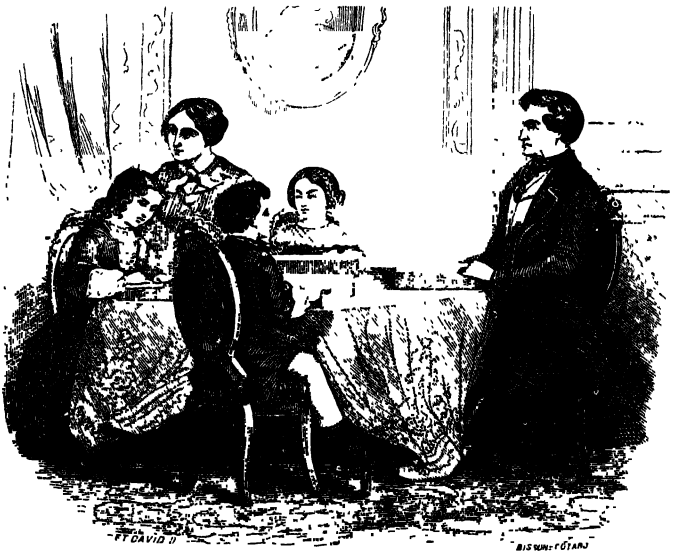
Nitrate of Silver.

the chlorine of the common salt leaving the soda with which it was united, and joins itself to the silver, forming chloride of silver the nitric acid, with which the silver was united, entering into combination with [illegible] forming nitrate of soda

We now find that [illegible] is better for purposes of photography than chloride of silver This is obtained by first washing one side of the paper with a solution of nitrate of silver, and when dry applying a solution of iodide of potassium * By this means a chemical decomposition takes place, as in the former instance, except that in this case iodide of silver and nitrate of potash are the results obtained As the nitrate of potash is very soluble in water, it is readily removable by pouring water over the paper, the iodide of silver being insoluble, remains on the surface of the paper By the subsequent employment of a mixture containing gallic acid [illegible] gallo-nitrate of silver, and acetic acid, the [illegible] action of light, that if it be placed in the camera, and the light from any external object be permitted to enter the box through the lens, a correct representation of the object will be obtained As the picture, although impressed on the paper, requires to be brought out distinctly, the paper, on its removal from the camera, is washed with a mixture of the same kind as that last mentioned, after which it is washed first in distilled water, and then in a solution of hyposulphite of soda, by which means any portions of

(*Continued in page* 361).

* We give the names by which these materials are called in ordinary [illegible] as we are aware that it is difficult to obtain [illegible] in many cases. It will say, for instance, *not* [illegible] Some of the preparations have [illegible] for instance, sulphate of iron [illegible] but readers were to ask for operas they would get an *impure* sulphate of iron, which would not answer their purpose so well It would not be at all worth while to enter any account of the mode of making the preparations used in photographic experiments, as our readers will get them cheaper and purer than [illegible] respectable chemist's or optician's, whose [illegible] prepa[illegible] and sell the



PRIMARY INSTRUCTION.

TOLOSA'S METHOD.

ALL who have anything to do with the teaching of the young, must have experienced great difficulty in fixing the attention of the pupils for any length of time on the subject before them. It requires considerable effort and long training to enable even adults to concentrate their faculties and bring them to bear upon one point; and it is well known that he who can do this readily has comparatively but little difficulty in mastering any department of knowledge. But in the young the mental as well as physical constitution being much weaker, and the resolution less powerful, the thoughts have a natural tendency to rove from point to point without dwelling long upon any. The teacher's duty is to combat, and if possible overcome this tendency.

Various plans have been devised from time to time to aid him in his task. St. Jerome, nearly fifteen hundred years ago, suggested the employment of moveable letters, made of wood or ivory, for teaching children to read. M. Tolosa has adopted his idea, and carried it out into practice, with, of course, many improvements. The use of moveable letters is, of course, nothing new in these days of printing; but he has gone further, and proposes to impart instruction by means of them, not in spelling only, but in grammar, arithmetic, geography, &c.

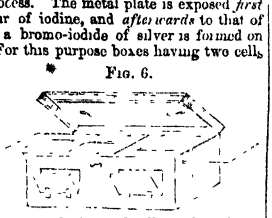
The case, which M. Tolosa calls the "Spelling Compositor," is at the same time a book, and a printing press on a small scale. All the letters of the alphabet, the points, Arabic numerals, &c., are distinctly inscribed on small blocks of wood, which can be fixed at pleasure in the compartments formed by parallel divisions running across a large board, or upon the divisions themselves, by means of small mortises. In this way any combinations of letters may of course be made. Our first engraving represents a school receiving instruction upon M. Tolosa's plan. The desks are placed so, that three boys may sit abreast, but of course the number may in all cases be regulated to suit circumstances. The middle place is occupied in each by a monitor, who superintends the operations of his two companions. Every boy has before him a Spelling Compositor, and the master has one of large dimensions placed in a conspicuous position against the wall of the room. He arranges the letters one by one, forming syllables and words, and the pupils perform the same process on the board before them. To do this properly, not only closely fixes

INSTRUCTION IN A FAMILY BY TOLOSA'S SYSTEM

their attention upon the words and the letters which form them, but requires a considerable amount of dexterity and promptness. The other engraving exhibits the same mode of instruction as it may be pursued in a family.

By this method, the ennui which was in a great measure inseparable from the old modes of instruction, is completely removed. The child's tact, attention, and perception, are brought into complete activity. He sees, understands, and acts. And this is not all. Everything which can instil into the infant ideas of order, of geometrical magnitude, must be productive of useful results.

If experience should justify the expectations which are formed of this system, there is no doubt that it will wonderfully simplify the process of primary instruction, and will doubtless come into extensive use all over Europe.



(Continuation of Photography from page 359)

the iodide of silver which have not been acted upon are removed (as their remaining would prove injurious), and the picture is now fixed, and capable of remaining unaffected by any subsequent exposure to the light. The picture thus obtained is, in fact, formed of pure silver in a very fine state of division. It is a negative representation of the object (the shades and lights reversed), from which thousands of positive pictures, or pictures resembling nature, may be taken; thus resembling the copper plate of the engraver, from whence, when once engraved, any number of pictures may be taken.

The lecturer then spoke of the method of obtaining daguerreotypes, or photographic pictures, on silvered plates of copper. As a description of this process has been given in the *Illustrated Exhibitor* we shall not say more respecting it here,

except to notice the use of bromine as an accelerating or quickening agent in the process. The metal plate is exposed *first* to the action of the vapour of iodine, and *afterwards* to that of bromine, by which means a bromo-iodide of silver is formed on the surface of the plate. For this purpose boxes having two cells or divisions are used, the one containing iodine, the other bromine, as shown in the accompanying engraving. The learned professor next explained the collodion and albumen processes, which we are particularly noticed in the *Illustrated Exhibitor* (No. 7), we, therefore, shall not dwell on them here. He then exhibited some collodion pictures, which were taken *instantaneously*, and which we found, on close inspection after the lecture, to be very superior specimens of photographic art.

Fig. 6.

There is one point which we must not forget to mention, the more so, as it will appear very strange to the *great* majority of our readers, it is the circumstance that it is not the brightest and clearest sunshine which is most favourable to photographic experiments. Mr Hunt stated, that in England the months of March, April, and May, are usually far more favourable to these operations than June, July, and August. In tropical climes, where a brilliant sun is giving the utmost degree of illumination to all surrounding objects, all photographic preparations are acted upon more slowly than in the climate of England, where the light is less intense. As a remarkable instance of this fact, a circumstance may be mentioned, which is curiously illustrative of the power of light to interfere with the actinism. A gentleman well acquainted with the daguerreotype process, took with him to the city of Mexico all the necessary apparatus and chemicals, expecting, under the bright light and [illegible] of that climate, to produce pictures of superior excellence. Failure upon failure was the result, and although every care was used, and every precaution adopted, it was not until the rainy season set in that he could secure a good daguerreotype of any of the buildings of that southern city.

When the daguerreotype was discovered, the celebrated French philosopher, Arago, expressed his regret that the scientific men who, at the time of Napoleon's invasion of Egypt, collected so much valuable information respecting that ancient country, had not been then in possession of the ready means which photography would in the present day have afforded them, of taking copies of inscriptions, pictures of ruined temples, pyramids, &c., drawn by the pencil of Nature herself. The expression of these regrets led the Government of France to send out competent persons, supplied with every photographic requisite, to effect those desirable objects, in [illegible] but also Central America, explored for the [illegible]. The result, however, was the interfering action of the clear light of the sun in these countries, that the expeditions proved almost entirely failures.

If two engravings be taken, the subjects of which it is desired to copy, by means of photography, and a piece of *yellow* glass be placed between the prepared paper and one of the engravings, and a piece of *blue* glass between the other engraving and the paper, it will be found that the copy obtained by the latter is very far superior to the other, thus proving that it is not the principle of *light* residing in the *yellow* ray, but that of *actinism*, or the chemical principle in the *blue* ray, which is the photographic agent.

The learned professor next spoke of the various modifications of the photographic art, such as the cyanotype, chrysotype, &c. In the cyanotype the paper is first moistened with solution of tartrate of iron, and afterwards with prussiate of potash, in which case a blue coloured ground is obtained. In the chrysotype a solution of tartrate of iron is also first used, and afterwards a solution chloride of gold.

The amphitype pictures obtained by Mr. Talbot were next noticed, those pictures possess the property of appearing as negative pictures, if backed with white paper, and of positive when backed with a black substance.

Mr Hunt then briefly referred to the very important applications of photography now made to the registering of magnetical, thermometrical, and barometrical observations, but it would be impossible for us to do justice to this important subject without illustrations. We shall, therefore, give in the *Illustrated Exhibitor* a full account, with illustrations, of the instruments used in the Greenwich Observatory, for this purpose. Suffice it, for the present, to state that, by means of photography, the sun is made to register correct accounts of those magnetic disturbances, which he himself produces, in relation to our earth. The height of the mercury in the barometer and thermometer, at all times of the day and night, are also accurately registered by the same means.

A TIGER HUNT.

FROM THE JOURNAL OF CAPTAIN MUNDAY.

"At four P.M. (so late an hour that few of us expected any sport) Lord Combermere and nine others of our party, mounted elephants, and taking twenty pad elephants to beat the covert, and carry the guides and the game, proceeded towards the swamp pointed out as the lurking-place of the buffalo-devouring monster.

"The jungle was in no places very high, there being but few trees, and a fine thick covert of grass and rushes. Everything was favourable for the sport. Few of us, however, expecting to find a tiger, another man and myself dismounted from our elephants, to get a shot at a florikan, a bird of the bustard tribe, which we killed. It afterwards proved that there were two tigers within a hundred paces of the spot where we were walking. We beat for half an hour steadily in line, and I was just beginning to yawn in despair, when my elephant suddenly raised his trunk, and trumpeted several times, which my Mahout (elephant driver) informed me was a sure sign that there was a tiger somewhere 'between the wind and our nobility.' The formidable line of thirty elephants, therefore, brought up their left shoulders, and beat slowly on to windward.

"We had gone about three hundred yards in this direction, and had entered a swampy part of the jungle, when suddenly the long wished for 'Tallyho!' saluted our ears, and a shot from Capt M confirmed the sporting *eureka!* The tiger answered he shot with a loud roar, and boldly charged the line of elephants. Then occurred the most ridiculous but most provoking scene possible. Every elephant, except Lord Combermere's, (which was a known staunch one) turned tail, in spite of all the blows and imprecations heartily bestowed upon them by the mahouts. One, less expeditious in his retreat than the others, was overtaken by the tiger, and severely torn in the hind leg; while another, even more alarmed, we could distinguish flying over the plain, till he quite sunk below the horizon. The tiger, in the meanwhile, advanced to attack his lordship's elephant, but, being wounded in the loins by Capt M.'s shot, failed in his spring, and shrunk back among the rushes. My elephant was one of the first of the run-aways to return to action, and when I ran up alongside of Lord Combermere (whose heroic animal had stood like a rock), he was quite *hors du combat*, having fired all his broadside. I handed him a gun, and we poured a volley of four barrels upon the tiger, who attempting again to charge, fell from weakness. Several shots more were expended upon him before he dropped dead, upon which we gave a good hearty 'whoo! whoop!' and stowed him upon a pad elephant. As Lord Combermere had for some minutes alone sustained the attack of the tiger, a three-quarters grown male, the *spotta opima* were duly awarded to him.

"Having loaded and re-formed line, we again advanced, and after beating for half an hour, I saw the grass gently moved about one hundred yards in front of me; and soon after, a large tiger reared his head and shoulders above the jungle, as if to reconnoitre us. I tally-ho'd, and the whole line rushed forward. On arriving at the spot, two tigers broke covert, and cantered quietly across an open space of ground. Several shots were fired, one of which slightly touched the largest of them, how immediately turned round, and roaring furiously and lashing his tail, came bounding towards us; but, apparently alarmed by the formidable line of elephants, he suddenly stopped short, and turned into the jungle again, followed by us at full speed. Those who had the fastest elephants had now the best of the

sport, and when he turned to fight (which he soon did), only three of us were up. As soon as he faced about, he attempted to spring on Capt. M.'s elephant, but was stopped by a shot in the chest. Two or three more shots brought him on his knees, and the noble beast fell dead in a last attempt to charge. He was a full-grown male, and a very fine animal Near the spot where we found him, were discovered the well-picked remains of a buffalo.

"One of the sportsmen had, in the meantime, kept the smaller tiger in view, and we soon followed to the spot to which he had been marked It was a thick marshy covert of broad flag leaves, and we had to beat through it twice, and were beginning to think of giving it up as the light was waning, when Captain P's. elephant, which was lagging in the rear, suddenly uttered a shrill cry, and came rushing out of the swamp, with the tiger hanging by his teeth to the upper part of its tail! Captain P's situation was perplexing enough, his elephant making the most violent efforts to shake off his back-biting foe, and himself unable to use his gun, for fear of shooting the unfortunate Coolie, who, frightened out of his wits, was standing behind the howdah, with his feet in the crupper, within six inches of the tiger's head We soon flew to his aid, and quickly shot the tiger, who, however, did not quit his gripe until he had received eight balls, when he dropped off the poor elephant s mangled tail quite dead The elephant only survived ten days, but it was shrewdly suspected that his more mortal wounds were inflicted by some of the sportsmen who were over zealous id him of his troublesome hanger-on

'Thus in about two hours, and within sight of camp, found and slew three tigers, a piece of good fortune rarely to be met with in these modern times, when the spread of cultivation, and the zeal of English sportsmen, have almost exterminated the breed of these animals. Four other sportsmen of our pa returned to camp this evening, having been out for four days in a different direction, they only killed one tiger, but he was an immense beast, and was shot on the head of Colonel F's elephant, which he wounded severely This is considered the acme of tiger shooting' '

IMPROVEMENTS IN ELECTRIC TELEGRAPHS.

A PATENT has been enrolled by Pierre Armond Lecomte de Fontainemoreau, of Finsbury and Paris, of an improvement in electric telegraphs. The invention sought to be secured consists in the application to electric telegraphic apparatus of a key-board, similar to that of a pianoforte, in conjunction with a toothed cylinder combined with a ratchet-wheel and levers, put in motion by keys or hammers, by means of which it is ely requisite to place the finger upon a series of keys, on which signs, letters or numbers are written, to effect the transmission of intelligence. The arrangements of mechanism for carrying the invention into effect are as follows.—Beneath the key-board is set a cylinder or axis, from which projects a series of radial rods, equal in number to the keys, and set in a helical line around the cylinder, for the purpose of enabling each of the rods, during the rotation of the shaft, to be stopped by a catch attached to the particular key lowered The lowering of any one of the keys is caused to take effect on a horizontal bar, also placed underneath the key-board (which is so arranged as to rise to its former position when the key is released from pressure,) which bar, in its descent, liberates a ratchet, which gears into a ratchet wheel on the rotating shaft, and thus allows the shaft (which is set in motion by clockwork) to revolve until a second rod, corresponding with the key which has been lowered, meets the stop on that key. On the lowering of another key a similar effect is produced, and the shaft is turned through an angle proportioned to the length of the arc of the helix between the two keys which successively stopped its motion; so that if the cylinder is provided with an electric interrupter which opens and closes the circuit every time one of the teeth of the rachet-wheel passes through, the effect produced will be identical with that produced by the rotation of a dial provided with as many signals as there are keys in this apparatus, but with increased advantage. The rotation of the cylinder being uniform, and regulated to the greatest speed that the efficient working of the receiving apparatus will permit, a communication once established between the receiver and transmitter continues to subsist, independently of any irregularity in touching the keys, provided time be given for the hand of the dial to run over its divisions. The clock-work for setting the cylinder in motion must be wound up from time to time, but its use may be altogether dispensed with, and spring substituted for it, on which the bar, actuated by the keys, may be caused to take effect so as to produce on the ratchet-wheel a propelling power which should slightly exceed the average force required to be exerted

LITERARY NOTICES.

WITH the present WORKING MAN'S FRIEND is issued the last number of the MONTHLY SUPPLEMENTS To a certain extent, the two volumes devoted to the "Literature of Working Men" have been well received by the general public, and, considered in reference to their influence in developing the literary talent of many who would otherwise have had no medium for the publication of their thoughts, the design may be considered to have been highly successful That the pleasant relation subsisting between the Editor and his friends, however, should in newer [illegible], it is proposed that occasional articles from working men shall be inserted in the FRIEND, and that the Premises for Ingenuity shall be continued monthly, as before, with, it is hoped, fresh vigour and more originality than ever. To this end we invite the cordial co-operation of our subscribers.—March 6th, 1851

JOHN CASSELL'S SYSTEM OF NATIONAL EDUCATION, which he proposes to establish without asking for any special Act of Parliament The only assistance he intends to seek from the Legislature is, the repeal of the iniquitous and obnoxious tax upon the medium through which he proposes to convey his system of Education to the people, namely, *Paper* On Saturday, April 5, John Cassell's System of National Education will be inaugurated by the publication of *the first number of the* POPULAR EDUCATOR, in sixteen pages of double crown quarto, price ONE PENNY The whole system will be developed through the medium of *Weekly Numbers*, one penny each, or in Monthly Parts 5d or 6d each, according to the number of weeks in each month This System of National Education will include English Grammar, French, German, and Latin, Mathematics, Geometry Arithmetic, and Algebra, Astronomy, Geography, Geology, Natural History, Botany, Physiology, Chemistry Mechanics, History, Biography, Political Economy, Music, &c &c Every section of the system will be explained in the most where it is necessary, illustrated with suitable diagrams The whole will be written in a style sufficiently familiar to be perfectly understood by any child or youth who has merely learned to read, and which will at the same time interest and instruct both parents and children, and tend to promote universal education upon sound principles, and by an expeditious method Teachers and writers of first rate attainments are engaged to develop John Cassell's system of National Education, under the editorship of Professor WALLACE, A.M., of the University of Glasgow, Collegiate at the University of London, and author of various popular and works THE POPULAR EDUCATOR can be ordered through any bookseller

SANDWICH ISLANDS.

EXTRACT FROM THE NOTES OF A TRAVELLER.

The view of the shore from the anchorage was charming. Toward the south, as far as the eye could reach, a verdant plain was spread out before me, whose shores were washed by the ocean; and to the north-west the land rose gradually toward the interior, until far inland the snow-capped summits of Mounaloa and Mounakea reached an elevation of nearly sixteen thousand feet above the level of the sea. Along the shore the cocoa-nut tree waved its feathery branches to the refreshing trade-wind, and the thatched roofs of the village of Hilo peeped here and there from among the deep foliage in which they were imbedded, while just beyond the landscape was occasionally studded with fields of the coffee-plant and waving sugar-cane.

I landed upon the beach opposite the town, in the mouth of a beautiful little stream, called Waia-loa, which, rising a short distance from the coast, supplies the royal fish-ponds, and then empties into the bay. No sooner had I set foot on shore, than I was surrounded by a crowd of natives, some of whom were leading very good-looking horses, which they pressed me to hire. I declined the offers of several, who, in half-English, half-Kanaka, asked me to give their steeds a trial. Some of my companions, however, who were desirous of testing their mettle, mounted forthwith, and set out toward the village at full speed. But they did not go far before they found their beasts were given to the vile practices of stumbling, shying, and balking, several were thrown before they had advanced more than a few hundred yards, but their fall being upon the sandy beach, they escaped without injury.

I was much diverted with the costumes of the natives who followed me in my walk. Some were entirely naked, with the exception of the "maro;" some had on only a shirt, or a piece of tapa cloth, covering the back and breast, and extending down as far as the knees; others a jacket or straw hat as the sole article of dress. Proceeding along the beach, I soon arrived at the mouth of another little stream, called Wai-Kama, which I crossed in a canoe that was very civilly offered to me by one of the natives; after which, a short walk brought me to the edge of the village.

Hilo contains about eight or nine hundred inhabitants, but as the houses are much scattered and surrounded by a dense tropical vegetation, the dwellings, for the most part, are hidden from the view entirely, or their thatched roofs only are seen peeping up from their verdant nests. This peculiarity, together with the quietude that reigns around, gives a rural air to the place, which is quite inviting to one who has been long subjected to the confinement and monotony of a life on board ship. Indeed, the waving branches of the trees, and the rustling of the green leaves, stirred by the refreshing sea-breeze, together with the perfume of sweet-scented flowers that filled the air, produced in me sensations indescribably pleasing—sensations that no one can realise who has not been long sent abirom these natural companions of man's existence.

Strolling through the village and surrounding country, I passed many very pleasant days in visiting the habitations of the natives, and witnessing their primitive mode of life. Their houses are constructed after a very simple method. A square spot is cleared and marked out of the size requisite for the building; then rough posts, formed out of saplings, are placed in the ground, a short distance from each other around this, and upon the top of these, rafters are secured. The frame as it thus stands is then thatched with the leaf of the pandanus-tree, the sugar-cane, and fern. The cane and fern are used for the roof, and the pandanus-leaf for the sides. A door in front, and one in the rear, afford light and air to the occupants, the purely native-houses having no windows. One-third of the interior is occupied by a rough staging, about a foot and a half high, covered with several layers of mats, and screened off by a curtain of tapa cloth, or calico. This is the common bed for the whole family.

Their household utensils are as simple as their houses. Calabashes of different shapes and sizes supply the place of iron and crockery-ware, so that their tubs, bowls, pitchers, plates, &c., may be said to grow upon the same vine. They require no utensils for their simple cookery, for this is prepared by a baking process under heated stones. The principal articles of their diet consist of fish and the root of the taro. The first, before cooking, is enveloped in several layers of large leaves, well secured at each end; and the last is simply baked and eaten as the potato, or, after baking, is mashed up, kneaded out, and mixed with water, in a large calabash, until it becomes of the consistency of mush. In this state it is called "Poi," and is the national dish of the country.

To see the avidity with which this is consumed, one would suppose it to be the most palatable food in existence. It was quite diverting to behold a half-dozen or a dozen natives gathered round a large calabash of this article, and to witness with what surprising rapidity each one in his turn would dip two fingers of the right hand into the vessel, and convey a large portion to his mouth, which was held wide open for its reception. To give a zest to this repast, a little salt fish, or salt water, is usually at hand, of which each occasionally partakes.

Wherever I went I was greeted with smiling faces, and received the national salutation of "Aloha," or welcome, and I scarcely ever remember to have passed a house without having been invited to enter. I almost invariably found the family to be very numerous, in proportion to the size of the domicile. They were generally quite unoccupied, some lolling about the mat floor, others fast asleep under a piece of tapa cloth. As soon as I was seated, the female part of the household, with the natural curiosity of the sex, usually approached to scrutinize the dress and appearance of the "Kaihouri," or stranger. They would examine me from head to foot with the utmost particularity, every now and then exclaiming, "Maiki!" pretty, when they noticed anything which met with their approbation.

The young girls, though a little dark, were often quite handsome, and usually very interesting. Their glossy raven hair, falling unconfined upon the shoulders, and frequently curling in natural ringlets; their dark lustrous eyes, as soft as a gazelle's, and full of expression, their teeth of matchless whiteness and regularity, embellished faces that appeared only to know how to smile. And the villanous dress which civilisation has placed upon their backs, consisting of a single loose gown, unconfined at the waist, could not altogether hide their fine figures and well turned limbs, which they appeared very fond of displaying to the best advantage. But the charms of these island beauties last only for a short period; a few years after puberty, the sylph-like form of the girl changes to the gross *embonpoint* of the woman, and the features become coarse and masculine.

Indolence appears to be the besetting sin of the natives. Their wants being few, they have no motive for exertion, and hence the greater part of their time is passed in listless idleness. And not until their wants, either real or artificial, are more numerous, and it requires exertion to satisfy them, will civilisation make much progress, and intelligence be propagated to any extent among these islanders; for labour appears to be the natural stimulus to the energies of man—the first link, as it were, in the chain which advances him in the scale of being.

At the edge of the village is the beautiful little river Wai-Rouka, which, descending rapidly over its rocky bed, through wild and picturesque mountain-passes, forms two beautiful cascades just before it empties itself into the ocean. The stream above and below these cascades is the common bathing-place for the whole village. From early dawn until evening, it is thronged with swimmers of both sexes, and of all ages and sizes, some of whom are seen sporting like so many porpoises in their natural element, some diving from cliffs twenty or thirty feet high, while others are reclining upon the rocks and basking themselves in the broiling-hot sun.

But the greatest diversion here, especially among the young girls, was to plunge into the stream above, and allow themselves to be swept down by the rapids over the cascade. Whether this preference was caused by a species of savage coquetry, arising from a desire to display their sylph-like forms to the best advantage, I will not pretend to say; but certainly these island beauties, as free from the incumbrance of dress as was their mother Eve before the fall, appeared to be highly pleased when they attracted particular attention.

I often passed an idle hour sitting upon the banks of Wai-Rouka, witnessing the graceful movements of these Naiads,

as they fearlessly sprang into the stream, were swept down over the rocks by the boiling rapids with the speed of a race-horse, until arriving at the edge of the cascade they were launched off into the white foam; then plunged into the calm deep basin below, and, still visible, sank down, down through the crystal waters, until suddenly rising again to the surface, they shook the diamond shower from their flowing tresses, swam toward the the precipitous rocky walls that shut in the stream on each side, nimbly clambered up their side, and joyously returned to perform the same feat over again.

Wai-Rouka, arising in the snow-capped summit of Mounakea, is beautifully picturesque along its whole length. Gathering volume as it descends in its rapid course toward the lowlands, it is seen rushing through deep ravines, boiling over rocky beds, spreading out into placid basins, and tumbling over huge precipices, until it empties itself into the ocean. Its most celebrated fall, 'Ka-wai-anue-nue,' or the Rainbow-Cascade, so called from the numerous rainbows formed in its spray, is about two miles from the village. Here two broad sheets of water, separated a few feet by a verdant knoll, tumble over a precipice of one hundred feet, and joining quickly in their descent, spread out into one sheet of silvery foam, which falls into a calm basin below, surrounded by lofty banks which are covered by the rudest and most luxuriant vegetation. From this elevated spot there is a fine view of the village and bay, as well as of three extinct craters, just back of the former, which are now clothed in verdure, and present the appearance of three regularly-formed colossal mounds, placed in a row.

The ancient custom of eating raw fish is still continued in this island; nor is it confined only to the lower class of people. I had an opportunity of being an eye-witness to this, for while strolling out one evening a short distance from the village, I was caught in a heavy shower of rain, and took refuge in a chief's house, near at hand. Here I found a party consisting of about twenty individuals, squatted upon the mat floor, and feasting upon raw shrimp and 'poi,' which was served up in calabashes, as is the usual custom. As I entered the house, the governor of the island was about taking leave, doubtless well filled with the delicious repast. Dogs are also eaten, and considered a great delicacy.

During my stay I was invited to a dinner, after the native fashion, given by Mr. P——, an American, who has resided for many years upon this island, and whose kindness to strangers is only equalled by his hospitality. The dinner was given at his country-house, a few miles from the village, and was served up under the umbrageous boughs of a grove of bread-fruit trees. Every article was prepared *a la* 'Kanaka,' that is, first enveloped in leaves, and then baked among heated stones, covered up with earth. Our fare consisted of fish, pig, chickens, turkeys, etc., etc.; but the most curious dish of all was a baked dog! No vulgar cur, I assure the reader, but of a species peculiar to the island, which are reared with the delicacy of an infant, and fed upon 'poi,' until considered in good condition for eating. I must say that the idea of eating dog was somewhat revolting to me at first, but seeing others partake with great relish, my curiosity got the better of my stomach, and as I thought in all probability it might be the only opportunity I would ever have of tasting such a delicacy, I soon had a goodly slice smoking on my plate. 'Ce n'est que le premier pas qui coûte,' for I soon found doggy very tender, very juicy, and most delightfully cooked.

Before closing my remarks on Hawaii, I cannot refrain from mentioning the names of the Rev. Mr. Coan and the Rev. Mr. Lyman, American missionaries, from whom I, as well as my associates, received the kindest attention during our stay. It was a beautiful sight to behold these voluntary exiles from their native land, far removed from the turmoil of the busy world, its vanity and ambition, devoting themselves body and mind to the spreading of the religion of the cross among these poor islanders. Although their abodes were humble, they were nevertheless the scene of contentment and happiness. Their wives share with them their exile, and lighten the dull monotony of their changeless life, and smiling children are rising up around them, who perhaps in some future day will be ready to carry out the good work their fathers have commenced. Mr. Coan is the pastor of Hilo, and has likewise several parishes in the interior under his charge, all of which he visits at stated periods, performing the journey on foot, which is not a light task in this climate.

Mr. Lyman devotes his attention principally to a native school, where about fifty boys are instructed in the usual branches of a common education, and are taught to relinquish their old habits, and conform to the usages of civilized life. The latter circumstance is calculated to be of more benefit to the cause of civilization than at first might be supposed. Constrained by example and precept at an early age to conform to the customs and usages of enlightened nations, these youths form habits which are carried with them when they have finished their studies, and return to their homes, in different parts of the island, where they become nuclei of light to those around them, diffusing their knowledge more or less according to the influence they are capable of exerting in their spheres.

The day appointed for our departure from Hilo having arrived, we were all obliged to be on board at an early hour, and our ship was immediately placed under sailing orders, which in a man-of-war completely severs all communication with the shore. The wind, however, did not prove favourable on that day for clearing the mouth of the harbour, at the entrance of which is a large shoal. The day after it still continued in the same quarter, and for seven successive days thereafter we were obliged to do penance on board ship, in sight of the charming scenes where we had been revelling for several weeks.

Some of the gentler sex took pity on our imprisonment, and swam off to pay us a visit of condolence. As they were not permitted to come on board, they played around us for several hours, delighting the crew with their easy and graceful movements through the water, and the dexterity which they showed in diving for buttons or pieces of money. If any article was thrown overboard, they darted after it with such rapidity that they always got beneath it in its descent through the water, and invariably caught it in their two hands, held out close together for its reception. Some time afterwards I learned that when these poor girls returned on shore they were arrested and imprisoned in the calaboose. Their kindheartedness toward the 'Karhouries' had induced them to break one of Kamehameha's laws, which prohibits women from visiting ships, unless by special permission from the authorities.

On the eighth day of our detention, the wind came out fair, and at seven o'clock in the evening we lifted our anchor, and stood for Lahaina, island of Maui. All the following day we skirted along the north-eastern coast of Hawaii, near enough to have a fine view of its picturesque scenery, embellished with numerous silvery cascades, foaming over its precipitous cliffs, and tumbling into the ocean. Many of these cascades had a fall of several hundred feet, and one of them, which possessed the greatest volume of water, was judged to be at least eight hundred feet in height.

On the morning of the second day after our departure, we entered the 'Pailola' passage, between the islands of Maui and Molakai, and at meridian came to anchor off the town of Lahaina, which is upon the first-named island. Lahaina, a town of about three thousand inhabitants, is situated at the foot of a range of mountains, which, rising gradually from south to north, reach an elevation of six thousand feet above the level of the sea. The northern part of the range is broken by gorges of several hundred feet in depth, with nearly perpendicular walls. These mountains are quite destitute of vegetation, and if they were not in some measure relieved by the verdure of the gardens in the town, and the cocoa groves along the shore, the place would present a truly desolate appearance. I was only enabled to take a glimpse at Lahaina, for our stay was so short that I could make but one trip to the shore.

I visited the royal palace, the residence of his Hawaiian Majesty before the removal of the court to Honolulu. This is an extensive building, in the form of a parallelogram, surrounded with balconies, and constructed out of a species of coral rock, a very handsome and durable building material. The American mission church also attracted my attention. This is beautifully situated on the border of the royal fish-pond, across which on one side through a lofty cocoa-nut grove,

American, that it occurred to me that it [illegible] it could be wafted over sea and land, and set down in one of

our country villages, no one would be able to tell it from a *bona-fide* Yankee meeting-house.

Lahaina is a great resort for whalers at certain seasons of the year, for the purpose of refreshment. Vegetables are quite abundant, and the Irish potato is cultivated in great perfection on the highlands of this island. The latter is of the greatest service to the whaler in his long voyages, for while his potatoes hold out he has no fear of the scurvy.

Leaving Lahaina at an early hour in the afternoon, on the morning of the next day we came to anchor off Honolulu. This town is situated on a plain about nine miles in length, composed of alluvial soil resting upon a stratum of lava. At the back of the town, and about two miles from the beach, runs a chain of lofty mountains, broken at one part by a deep gorge called the valley of Nuannu.

The whole face of the country shows the effect of volcanic agency; and although no living volcanoes have existed on this island since the memory of man, several extinct craters are still visible. Among these, Punchbowl Hill, at the back of the town, upon the summit of which a small fort is erected, and Diamond Hill to the eastward, are the most striking, as they still retain all the characteristics of living craters, so far as their form is concerned.

Honolulu has about nine thousand inhabitants, among whom there are about seven hundred foreign residents, principally English and American. The houses of the foreigners are mostly built of wood, some few, however, are constructed of coral rock, which is procured from a shoal at the entrance of the harbour. This building material has come into use within a few years, and is now used for all substantial edifices, such as stores, warehouses, and public buildings. The native population use the grass house, as in Hilo, but with many additions and improvements, borrowed from the whites.

The principal hotel in the place having no accommodations for lodging, I was obliged to rent a native house during my stay. I found this kind of domicile exceedingly cool and agreeable in that warm climate, for the thatched walls did not altogether prevent the air from circulating through the apartment, and in the stillness of the night the music of the breeze sighing through the thatched walls sounded pleasantly to the ear.

My next-door neighbour, with whom I soon formed an acquaintance, was a colonel in Kamehameha the Third's army. For a gentleman occupying so high a station, he led a somewhat singular life. His principal occupation was to sit at his door, squatted upon a mat, with nothing on save a loose robe of yellow pongee silk, until toward evening, when he would retire for a short time to the house, and reappear arrayed in a civilised garb, mount his horse, and gallop off on a ride. Upon his return, coat, pantaloons, shirt, shoes, stockings, &c., &c., were immediately laid aside for the yellow silk robe, and he would again resume his seat at the door until it was time to retire for the night. During my stay I did not observe that he varied this monotonous mode of life in the least, with the exception, perhaps, that once or twice he preferred to take his seat for a few hours under a tree near his house, instead of at the door, which was his favourite position.

The European and American society here is excellent. The stranger is received with the open arms of hospitality, and treated with the utmost kindness and attention during his stay. Dinner parties, evening parties, and pic-nics, fill up every idle hour.

Riding is a very favourite amusement among the ladies, and scarcely an afternoon passes but you can see several equestrian troops sallying forth to enjoy a gallop in the country. The Pali is the favourite ride, and if the stranger has a fair "cicerone" for his companion, this will probably be the first place he visits. Leaving the town, in a few moments he enters the lovely valley of Nuannu, blooming with the freshness of spring, and shut in on either side by lofty and precipitous mountain walls. Nuannu is formed by a break in the chain of mountains running parallel with the coast, and is about half a mile wide at its entrance, and seven miles long, passing transversely from the southern to the northern side of the chain, and contracting gradually until it terminates abruptly in a precipice of more than a thousand feet in depth.

The view from this spot is truly sublime. Above on either side tower the peaks of the mountain to an elevation of fifteen hundred feet, and far, far below, the eye rests upon a verdant plain, whose shores are washed by the ocean. The beholder might dwell for hours upon this scene with increasing delight, were it not for the strong wind that rushes through the narrow pass, with almost sufficient force to knock one down. The Pali, independently of its scenery, is celebrated as having been the scene of an awful tragedy in 1795.

Kamehameha of Hawaii, subsequently Kamehameha the First, surprised Kalamikupule, king of this island, and his followers, near the entrance of the valley, made a charge upon them, and drove them toward its termination. Kalamikupule and many of his party were slain, and the remainder, rather than surrender to the enemy, threw themselves off the precipice and were dashed to pieces below. This action was the decisive blow which placed Kamehameha in possession of the whole group of islands, which afterward in honour of him took the name of Hawaiian.

Scarcely a party makes a visit to the Pali without encountering one or two showers by the way, for the clouds hanging over the summits of the mountain peaks disperse their forces to the valley very frequently during the day. But these showers are so light and so much a matter of course to the residents of the place, that they appear to be rather a source of enjoyment than inconvenience, for they freshen the air, lay the dust, and produce a succession of the most brilliant rainbows I have ever beheld.

Equestrian exercise is a very favourite amusement of the inhabitants of this island, both male and female. Saturday is the great riding day, when every available horse in the town is brought into requisition. The riding-dress of the females is exceedingly picturesque: it consists of one of those bewitching little Panama hats, tastefully trimmed with ribbons and flowers, and jauntily set on one side of the head, a gay-coloured dress, and long scarlet cloth used as a skirt, which is wound round the waist and falls down in graceful folds so as to conceal the feet. They ride astraddle, sit their horses exceedingly well, and appear to be perfectly fearless from the manner in which they dash along. The favourite ride is over a level road to the eastward of the town, and from four o'clock in the afternoon until sundown, this is thronged with parties numbering from fifteen to twenty, cha[illegible]ging in the most break-neck style imaginable.

His Majesty Kamehameha the Third being absent on a visit to [illegible] Island, his consort, Queen Kalama, honoured our ship with a visit. As she came alongside, the yards were manned, and in a few moments after her reception on deck a royal salute was fired. The queen, at the time of her marriage, is said to have been the handsomest woman in the Hawaiian group, and she is even yet a remarkably fine-looking person. She was dressed in the European fashion, and her toilet, without being gaudy, was exceedingly elegant, and arranged with much taste. Her suite consisted of John Young, premier, a tall and remarkably fine-looking young man; Kehuanoa, governor of Oahu; Paki, chamberlain, a man of colossal stature, all of whom were in full-dress military uniforms; also R. C. Wyllie, minister of foreign relations, a Scotchman by birth, and Mrs Judd, wife of Dr. Judd, [illegible] Many of the principal people of the place, both natives and foreigners, visited the ship on this occasion, and the deck presented quite a gay scene.

After her majesty had made the tour of the ship, she was invited to partake of a handsome collation, and soon after the band struck up a quadrille, and the quarter-deck was brought into requisition as a "salle de dance."

In about two hours her majesty took leave, apparently highly delighted with her visit, and soon after the remainder of the company followed her example.

Almost every writer who has visited these islands has given some account of the American missionary establishment. Unhappily, their remarks have often savoured of harshness, and blame has been bestowed where praise was justly due. It is not my intention here to go over a field so thoroughly gleaned by others, for my visit to the islands was too limited, and my time too much engrossed by other matters, to look into the subject deeply. I would remark, however, that although extraordinary success may not have crowned the labours of the missionaries here, their success has been as great, if not greater, than it has been in other parts of the world. The difficulties they have to encounter are manifold; and one of the greatest of these, in my opinion, is the bad example shown to the islanders by the depraved population which commerce and adventure are constantly bringing to their shores.

MISCELLANEA.

DISTRIBUTION OF SEEDS.—Perhaps no part of the economy of nature is more wonderful than the provident care evinced in the preservation of seeds against the destructive influences with which they are likely to come into contact. The provision for their distribution is scarcely less admirable.—"Not only are the winds and the waters and animals put in requisition and unconsciously employed in the operation of sowing and planting, but the seeds themselves are endowed, in many cases, with certain mechanical properties which aid their dispersion. Thus, the awn of an ear of barley is so sensible to moisture, that it lengthens in damp, and shortens in dry weather, and by this alternate extension and contraction, aided by the short and thick-set prickles by which it is serried, it will, in the course of a few mornings, drag away the seed to which it is attached to some distance from its present stalk. Thus, again, the seeds of the thistle and dandelion have a species of downy wings attached to them, by means of which they float through the air, and are carried by the wind to great lengths. And thus, too, the pods of the broom and furze are furnished with an elastic spring, which, on being acted on by the head, forcibly ejects the seed, and with a considerable report to a distance from the spot. 'Who,' says Sir J. E. Smith, 'has not listened, in a calm and sunny day, to the cracking of furze-bushes, caused by the explosion of those little elastic pods, or watched the [illegible] of innumerable seeds floating on the summer breeze, till they are overtaken by a shower, which, moistening their wings, stops them further flight, and at the same time accomplishes its final purpose by immediately promoting the germination of [illegible] beneath? How little are children aware as they blow away the seeds of the dandelion, or stick burs in spite upon each other's clothes, that they are fulfilling one of the great ends in nature. Even man himself serves to waft the larger kinds of seeds from their native soil to far distant shores. While many cases, also, plants drop and disperse their [illegible] weather only which is just the kind of weather most favourable to its success for the seed, according to the farmer's adage, 'loves a dry bed'—there are some plants, natives of arid deserts, which act according to a different economy. Thus the cup of one plant of the desert has springs to close in dry weather, and to open only in the coming of moisture. Thus, also, the seed-vessel of the rose of Jericho is rolled by the winds along the wilderness until it meets with a moist spot, and then, and not till then, it opens and parts with its seed. How wonderful is all this arrangement and contrivance! Here is not the footprint of blind chance, but the finger of God."

A million of blades of grass makes a meadow, and millions of grains of sand make a mountain, the ocean is made up of drops of water, and life of minutes.

DO IT AND BE DONE WITH IT.—There is a very sensible German custom—concentrating the coughing and nose-blowing during the service-time at church. The clergyman stops at different periods of his discourse, stops back from the pulpit, stands and blows his nose. The entire congregation imitate his example, and disturb the service at no other time.

THE LABOURS OF A CONSCIENTIOUS M.P.—In the "Life of Edward Baines," late M.P. for Leeds, occurs the following report of a week's occupation, which will afford some idea of what an honourable member must undergo who conscientiously intends to do his duty to his constituents—a duty which obliges him to read all the blue books, and hear all the argum[illegible] submitted to his attention.—*Monday*. Ro[illegible] at six, much refreshed by two successive good nights' rest. Read parliamentary papers and reports till eight, from the hour of post till half-past eleven, corresponded with constituents [illegible] tended the House to present petitions, but standing low on the ballot-list, had not been called when the House adjourned at thr[illegible] mittees till four. Ho[illegible] lebate continued till nearly m[illegible], real business then began, continued till three in the morning, when the House adjourned. Walked home by morning twilight, pined a little after domestic comfort, soon forgot all cares, public and private, in sleep.—*Tuesday*. Rose at seven, read over petitions to be printed that day, [illegible] correspondence after the arrival of the post with ten letters. Attended the House at half-past eleven. In luck- name drawn out of the jar early—got on petitions afterwards attended committee till three. House resumed at five, sat till two o'clock next morning.—*Wednesday*. Rose at seven, attended to correspondence till twelve, walked till two, applied at [illegible] respecting the repeal of duties, and at the War-office for a soldier's discharge. Attended the House at five, sat till half past eleven.—*Thursday*. Rose at half-past six, resumed perusal of Poor-law reports—quite overwhelming. (A bill should be introduced to enable members to read and think by steam power.) Attended the morning [illegible] from [illegible] to five, committees. The House [illegible] sat till half-past one o'clock in the morning.—*Friday*. Resumed perusal of documents at eight, attended committee from twelve to four. The House sat at five, continued the sitting till three the next morning. A great deal of business done after midnight.—*Saturday*. Pretended [illegible] morning papers of course, [illegible] in taking exercise, and in reading and pondering over the copious parliamentary bill of fare for the next week.

A PARALLEL.—'About half a century ago,' says Sir J. B. Head, in his "Faggot of French Sticks,' there lived in a country village in England as maid-servant, a pleasing-looking young woman, of such delicate sensibilities, that, to use her own expression, 'she couldn't abear to see a [illegible] killed.' She married the butcher. At about the same period Napoleon, who cared no more for the effusion of human blood than the stormy petrel cares for the salt spray of the Atlantic Ocean, determined, from similar sensibilities, to cleanse Paris from the blood of bullocks, sheep, pigs, and quadrupeds of all sorts, by suppressing every description of slaughter-house within the city, and by constructing in lieu thereof, beyond the walls, four great public *abbatoirs*, besides smaller places of execution for pigs, and also for horses.

VISIBLE ROTATION OF THE EARTH.—Exceedingly interesting are the new experiments about the earth's rotation but it is said that a little more brandy in your water than usual will cause the rotation of the earth to be distinctly visible.

SYRIAN HOSPITALITY.—The Hon. F. Walpole, in his "Travels in the East," gives many illustrations of the national hospitality of the Arab tribes.—"Among the good qualities of the Arab," says he, "which name I apply to all the inhabitants of Arabistan, hospitality is universal, all may come, eat and drink, and be welcome. This is everywhere the case, of such as they have, all, even the lowest, are not invited, but have a right to partake. A poor man starts on a long journey, he takes a little bread in his breast, in the evening he arrives at a village. He is fed with what they have, he lodges as they lodge—in any house he chooses to enter. On the morrow he goes his way, with a fresh store of bread for the day's use. This is a fine quality, and one to which we must allow its due merit. The Scriptures relate of men of the town inviting to their houses the stranger they found lying in the gate or in the street. Such with us would be a strange case, not so in the East, where it would be but natural. During my stay at Latakia, where I resided four or five months, it was my endeavour in all things to live as a native, which I did by letting everything take its course. A stranger would come and pass a night, his donkey or horse was tethered in the yard, he sat, related stories, told the news of the place, and slept on the mats in the public reception room. In the morning, before daylight, he was on his way. The Ansayrii villagers would do the same, but these all considered themselves especially belonging

ARSENIC EATERS.—A letter from Vienna contains the following singular statement.—"A poisoning case at Csilli has given rise to the publication of some interesting facts respecting the arsenic eaters of Lower Austria and Styria. In both these provinces it appears to be a custom among the peasantry to consume every morning a small portion of the deadly poison in the same manner as the eastern world consumes opium. Dr. Tschudi, the well-known traveller, publishes an account of several cases which have come to his knowledge. The habit does not seem to be so pernicious in its results as that of opium eating. It is commenced by taking a very small [illegible] half a grain, every morning, which is gradually increased to two or three grains. The case of a hale old farmer is mentioned, whose morning whet of arsenic reached the incredible quantity of four grains. The effect it produces is very curious. The arsenic eaters grow fat and ruddy—so much so, that the practice is adopted by lovers of both sexes, in order to please their sweethearts. It relieves the lungs and head very much, also, when mounting [illegible] hills and entering into a more rarefied atmosphere."

THE CHINESE BARBARIANS.—Every boy in England is taught to believe that the Chinese consider him a little "barbarian." The belief may be said to grow with his growth, and strengthen with his strength. They who go to Canton go out with that impression—they who return bring it back. The term usually exasperates the man to whom it is addressed. More than once it has provoked active hostility. Mr. P. P. Thoms, however, contends that the whole thing is a mistake—that the Chinese describe us by no such word. He declares that the word *man*, which Gutzlaff and Morrison translate "barbarian," means simply "southern merchant."

ATLANTIC SUBMARINE TELEGRAPH.—There seems nothing really impracticable in such an undertaking. We have been assured that the same two gentlemen who first suggested and commenced this enterprise have expressed to some of our eminent engineers and capitalists their conviction of the feasibility of establishing a single line of communication between this country and America for a less sum than was paid for making a single mile of the expensive portion of the Great Western Railway. The proposition was first to extend it to Ireland—thence to the south-west coast, the nearest point for the American continent, and where the bold rocky coast offers depths that secure its safety from anchors, and thence to the nearest point on the American coast, considerably under 2,000 miles. Choosing the months of summer, and an experienced American and English captain, accustomed to the track, such a line, it was averred, might with very simple machinery be paid out night and day, with perfect safety, at the ordinary speed of the steamer. The vast importance of such an object is not to be weighed against a sum of £100,000, which, we are assured, would more than accomplish it if a single wire were only to be employed. The successful completion of one line would of course be speedily followed by that of others. This once accomplished, the extension of the line across the American continent to the Pacific would follow certainly, and we should have the astounding fact of a communication from the shores of the Pacific, crossing America and the Atlantic, and touching our shores in ...astant of time.

GEORGE WHITFIELD.—Of Englsh preachers Whitfield was by fa the first Many have surpassed him as sermonmakers, but none have approached him as a pulpit orator His influence was the same, whether addressing the most learned or the rudest auditory Garrick used to weep and tremble at his bursts of and even the cold Hume said he was worth walking twenty miles to hear But the greatest proof of his power is, that he could gather and keep around in awed silence the whole rabble of Bartholomew Fair. For a time in England he was decried and abused, caricatured by Hogarth, and ridiculed by Foote, but he soon lived down such hostility, by the nobility and blamelessness of his character, as well as by the wonderful effect of his eloquence and zeal. Since Cowper's worthy panegyric of him, as has been the case with Bunyan also, men of taste and learning have forborne to speak of the great Methodist preacher otherwise than with admiration and praise.

EQUALITY.—"Lor, sir, them as torks about hequality don't no nothing about it," said the driver. "Spose we were al equal at this here minute—why, we should be jest like old Rhodes's cows a grazing, why, we should all on us get a good feed, and jest as we'd done, some precious thief or other would quietly drop in and milk us!"

HISTORY OF THE PENNY.—According to Camden and Spelman, the ancient English penny was the first silver coin struck in England, and the only one current among our Saxon ancestors. In the time of Ethelred, it was equal in weight to threepence. Till the time of King Edward I the penny was so deeply indented that it might easily be broken, and parted, on occasion, into two parts—these were called half-pence, or into four—these were called fourthings, or farthings.

ANSWERS TO CORRESPONDENTS.

EDWIN PLANT and others wish to know from what source they can obtain the best information relative to New Zealand and other fields of emigration. We shall shortly publish a little work which will contain the information required.

G. W. wishes to be informed whether an apprentice is free to leave his master when he has arrived at 21 years of age This is rather a nice question Apprenticeship being a mutual contract between a master and an infant (in law this word signifies a person under 21), it appears to us, though we have no legal authority for our opinion, that such agreement is no longer binding after the apprentice has arrived at his majority. If the *man*, however, acquiesce tacitly in the act of the *infant*, he cannot afterwards withdraw from the contract till the period of his apprenticeship has expired. Indentures are determinable by the consent of all parties, and by the bankruptcy or death of the master; but not where the widow carries on the business.

The master may chastise, but cannot discharge his apprentice without the consent of the latter. If an apprentice, whose premium does not exceed £10, run away from his master, he may be compelled (20 Geo. II, c. 19), to serve beyond his term for the time he absented himself, or make suitable satisfaction, or be imprisoned for six months Apprenticeship in England is usually for seven years, in Scotland and Ireland five or three years is considered sufficient to teach a lad the most difficult trades.

CHARITY.

—Home
Is the loved retreat of peace and plenty,
Where, supporting and supported,
Polished friends and dear relations
Meet and mingle into bliss"

So sang Thomson, the poet of the Seasons, and we all acknowledge the truth of the description. If we look back on the memories of our lives, does not the picture of Home stand out in bold relief from among all the cares and sorrows with which we may have been encompassed? There, amid the friends

"There is in every human heart,
Some not completely barren part,
Where seeds of love and truth might grow,
And flowers of generous virtue blow."

Home! there is, perhaps, no word in the English language to which we respond more warmly. In far-off lands—amid the solitudes of ice-bound wastes or in the depths of torrid forests—you chance to meet a countryman, you clasp his hand and call him Brother, for you can talk together of home and mingle sweet memories of youth in your discourse,

A MEDALLION IN BRONZE, BY MOHRING, OF BERLIN, AFTER TIECK.

with whom we have lived in familiar intercourse; there, surrounded by influences which make alike the palace and the cottage holy ground; there, encompassed by the tender ties of love and duty—may we find the truest sympathies and the most enduring faith. Who shall pretend to calculate the worth and beauty of that love which teaches the child to lisp its first accents of goodness and virtue? who shall sound the depths of that whole-heart remembrance which brings the wanderer back after years of absence and ill blood?

Images of that quiet cottage in the village or that dusky house in the great city rise up in the mind, and the heart is softened by the remembrance—softened and chastened too. The rough hard man, whom the world has so severely handled, has become a child again in spirit, and the light of love is upon his heart, shining calmly and still through the twilight of a thousand softening recollections. In the homes of the virtuous Charity has her abiding place. Not that kind of charity which seeks reward for well doing; which boasts of its good-

ness, and loves to see its name in subscription lists in morning newspapers, —but that which "vaunteth not itself." That charity only is true which follows the doctrines of Him who once upon a mountain taught the people—"to visit the fatherless and widows in their affliction, and keep ourselves unspotted from the world."

It is in the power of few of us to practise that largeness of charity which redresses the injured; relieves the distressed, cherishes the forlorn, and comforts the suffering, because few of us have the necessary means of fortune; but it is in the power of every one of us to beget in himself that favourable disposition of mind which prompts us to be tender of others' feelings; to be careful not to offend, to adjust our manners to that of those with whom we have to do, and to "provoke one another to love and good works" a charity like this is independent of all mere pecuniary aids, and is above all money calculations. The kind word spoken in season, the gentle voice; the sympathising glance the "drop of cold water given in the name of the Lord," are so far from valueless, that of themselves they form the essence and spirit of true charity Money and gifts are not the most efficacious forms of charity, unless accompanied by the spirit that "suffereth long and is kind," that "knoweth no evil," and breatheth no reproach, and is "kindly affectioned one towards another in brotherly love."

Many more arguments in favour of this good, great, and desirable virtue, will suggest themselves to the reader on examining the picture. Here we see a matron surrounded by the objects of her charity On one side is the maiden she has rescued from sickness and almost death, on the other, with his face turned lovingly towards her, is a youth whom she regards affectionately, while by her side and at her feet young children play in the confidence and innocence of their hearts

The original, by Mr. Mohring, of Berlin, was exhibited in the Crystal Palace

What higher virtue than this —the charity which blesses he who gives and he who receives? what nobler exercise of the faculties with which we are endowed, than to strew the path of pain with flowers, and help the y on their wearisome pilgrimage through life:

"Full oft from what man xplore,
Advantages arise,
Good often will from evi
Mercy oft comes in garb e
The Christian to e

"Blessings which daily w ive
Too oft unviewed wi nkles eves
But if withdrawn or vei grieve,
And learn at last, when lost, their value high to prize"

LETTERS FROM CALCUTTA.—No VI.*

Of all the cities that I have hitherto visited, I have found Calcutta the most difficult to form such an intimate acquaintance with as to enable me to give a description of it, not because its plan is one of great intricacy, or that it contains any unusual variety of features, but because it is impossible to walk in the streets at any hour, or to ride in an open carriage during the day. As the health of horses suffers as much from the climate as that of human beings, it behoves us to take great care of them, and as nothing can compensate for the loss of the evening drive on the plain, no one will risk it for the sake of "perusing the city," and thus many persons may reside for years in Calcutta without knowing more of it than may be seen on their way to church, or to visit a friend, and this little is but a peep through the closed venetians of a carriage But this is no great loss: as far as the native city is concerned the streets, with some few exceptions, are narrow and dirty, with but little of an oriental character. There are no handsome shops, and every window is closed with green venetians to exclude the blazing sun. There is neither pavement nor pitching, but a thick covering of red sandy dust, rising in clouds if the least breeze prevails, and where sidewalks should be are open gutters, which though kept tolerably clean by the street sweepers, are still anything but agreeable either to sight or smell; add to this, that the streets are encumbered with a swarming native population, not remarkably decent in their habits, and accustomed to wash, shave, cook, smoke, and sleep in the open air, and you will see that a walk in search of the picturesque, if once taken, would scarcely be repeated.

The approach to Calcutta is extremely imposing, and the general appearance of the European part of the town fully justifies the appellation of the city of palaces. It seems at first a mass of large mansions fit for the abodes of princes, pillars and balustrades, arches and porticos, everywhere meet the eye, all glittering white in the sunshine, and interspersed with the rich green foliage of magnificent trees. The stranger having come up the river in the steamer till within sight of the city, will transfer himself to a covered boat, or Beauleah as it is here called, and will be landed perhaps at the Prinsep's Ghaut, a structure in itself so handsome as to give him no mean idea of the place of his destination. Broad flights of steps, guarded by lions carved in stone, lead from the river's edge to a succession of pillars and cool colonnades, the shade of which he will find extremely welcome while he waits for his baggage, or listens to the intolerable clamour of a hundred half naked coolies ready to pounce on his luggage or hustle him into a Palkee Through the arches, he will look on a broad green plain, equal to Hyde-park in extent and beauty, crossed by several broad roads and dotted with large evergreen trees Immediately before him is the impregnable fortress of Fort William, covering an immense space of ground, but the rows of cannon whose murderous mouths gape on him would scarcely offend even a member of the Peace Society, as they have long been used only to salute some important personage, or to announce the arrival of the mails from Europe The maydam or plain is bordered on the side opposite the river by the handsome mansions of Chowringhee The west end of Calcutta presents very much the same appearance as Park-lane, or the houses in the Green-park, except that each stands alone in the midst of what is here called a compound, *i.e.*, a court-yard and garden, which is laid out with flowering shrubs and trees, and has always a number of low flat roofed offices for the accommodation of the native servants. At the head of the plain, and commanding a view of its entire extent, stands the residence of the Governor-General, with its dome and statue of Britannia, and its four arch gateways surmounted by the sphynx and the British lion The rows of handsome buildings which surround it on three sides are called Government-place To the east and west are the Esplanade, with the Town-hall, the courts of Law, the Treasury, and other government buildings. Passing Spence's Hotel, said to be the best in Asia, and the old cathedral, and proceeding through Council-house street, we shall enter Tank-square, called by the natives Lol Diggee, in the centre of which is an immense tank or reservoir of water, its borders being planted with tropical plants and trees. The broad gravel walk round is neatly kept, and but for the intolerable heat would be an inviting promenade. At one corner of this square lies the site of the famous Black Hole, in which, during our early struggles for dominion, 146 Englishmen were imprisoned, only 22 being found in the morning to have survived the want of air and space, painful in all countries, but doubly destructive in this burning clime. The room has long since disappeared. On one side of this square stands a handsome range of houses called Writer's-buildings, formerly the residence of the young civilians who came out as embryo magistrates. On the other side is the old government house, now converted into a kind of bazaar, or emporium of all kinds of European goods, and a favourite resort of the ladies. Everything is extremely dear, the rupee passing for the shilling; a miserable crushed and faded bonnet which in some London bye-lane would perhaps be marked 10 shillings, being here priced 15 and 20 rupees, but we have no choice between the Exchange-hall and the French milliners, whose prices are still more exorbitant.

Most of the houses in this immediate vicinity are very spacious, with lofty rooms and wide verandahs, and were formerly occupied by the merchant princes, who, as far as they now exist, have taken flight to the various beautiful suburbs with which Calcutta abounds; though many of the government officers and principal professional men still reside here. They

* Letter No V appeared in p 300 of this volume

are all flat-roofed and without chimneys, fires being scarcely needed in the city.

Several important streets lead out of Government-place; of these the principal are Court-House-street, where are the chief jewellers' and confectioners' establishments,—Cassitollah, full of furniture and coach-building workshops, and of shoe-making establishments, all of which are kept by Chinese, who are very clever in these arts. Dhurmtollah is another of these great thoroughfares, and would be a handsome street but for the bazaars which in all their filthiness occupy a great part of it. At the entrance are, on the one side, a handsome mosque built by a son of the celebrated Tippoo Sultan, and on the other a Roman Catholic church, and about half a mile further on is the principal chapel of the London Missionary Society. Continuing a little further on in this street, we shall come into the Circular-road, which is nearly six miles in length, and incloses the city on all sides, except that which is bounded by the river. It is a broad and picturesque road, on the borders of the jungle, shaded by cocoa-plantain, and other tropical trees, with here and there a large on interspersed amid the clustering native huts. Here we shall pass a large Mohammedan cemetery, distinguished by the sculptured turban and crescent on the crowded tomb Further on is the Protestant burial ground, which ten years ago was enlarged and supposed to have been made sufficient for the wants of the community for many years to come, but is already full, so great are the ravages of death here We shall also pass the Baptist Mission press and chapel. Numbers of mosques and tombs meet the eye in every direction, which add greatly to the picturesqueness of the [illegible] they are painful evidences of the [illegible] people. Immediately outside this road is the great Mahratta ditch, which was the old fortification of the city This is the boundary of Calcutta, and the inhabitants of the city are frequently styled the people of the Ditch Having passed the roads leading to the military stations of Barrackpore and Dumdum, shall cross one of the many suspension bridges which thrown across the canal which unites the city with the great Salt Lake lying to the eastward, and may return to the point from whence we started by the Strand-road, running close along the river, or the Chitpore road

ch perhaps is more amusing, as it leads us through the principal bazaars of the native town

In making such a circuit as I have described, nothing strike you so much as the denseness of the population, each bye-lane pours out its swarms as from a hive, and every principal street has the semblance of containing a gathering mob You would imagine that everybody was out of doors, yet, if you look into the huts and shops, you will see nothing but the black faces and gleaming eyes of groups squatting round a hookah, the constant companion of both sexes and of all ages, or stretched at full length on the ground These crowds have not the least idea of getting out of the way before a carriage, and they will suffer the horses' heads to touch them ere they will turn aside, and this, notwithstanding the screams of the syce or groom, who is continually shouting to them in Hindustani, "Ai! right hand fellow—ai! bullock fellow ai! dirt fellow"—and so on, according to their position or occupation. The Hindoos are all fatalists, and the fact that so few accidents occur must be ascribed to their good fortune, and to the carefulness of the drivers.

The appearance of the people is very striking to a stranger's eye. You will see every shade of colour, from black to yellow; and every variety of clothing, from the scanty waist cloth of the cooley or porter, to the flowing muslins of the fat baboo, a name given indiscriminately to every one above the rank of a mechanic. Children, even as old as six or seven years, are generally quite naked; and, during the hot weather, the taste of the labouring classes seems to lead them to cover the head very carefully, and let the rest of the person take its chance. Women of the lower orders, (and only such are seen in the streets) wear only one long piece of cloth, which is fastened round the waists, and brought up across the breast and over the head, thus enveloping the whole form. It is frequently of bright colours, and sometimes gracefully arranged, but in general nothing can be more unpleasing than the appearance of these degraded creatures, especially when they are old.

This part of the town contains many Hindoo temples and large mansions inhabited by the great Hindoo families, each of which has an idol's house attached, and situated on one side of the usual central court. It is impossible to pass through the native town without feeling as St. Paul did at Athens, when he saw the city wholly given to idolatry—especially during any of their festivals, when they carry their gods in procession, with frantic leaping and shouting, and the deafening clash of drums and cymbals. But we must hasten on, for the sun is getting too high for safety, and if the noise and crowd have not wearied you, the abominable odours of these undrained and filthy streets will make you rejoice to turn into Tank-square once more, and hail with delight the spires and domes of the European town. As for *purity*, however, the drainage of Calcutta is so bad that no one would desire to linger in any part of it, and the Board of Health would probably discover sufficient cause for the abounding of disease, apart from the climate.

After the first novelty has worn off, the streets of Calcutta are by no means agreeable. As I have said before, there are no inviting shop-windows, and no pleasant faces peeping from those dull-looking venetians, no European's walk, and no ladies are ever seen, in them. There is nothing but dust and dirt—creaking bullock carts, and palanquins which glide noiselessly along on the shoulders of the bare-footed and [illegible] bearers, and from them colour and shape give the [illegible] coffins, while we shall look in vain for the gay panels and liveries of the English carriage—those used by business men being as ugly as they are convenient, and all, even when really handsome in shape, are painted of a dark colour. The custom of the natives to wash both their persons and their clothes in the public thoroughfares, and at all hours of the day, is another very disagreeable feature. Nor must I omit to mention the myriads of kites and carrion crows for ever cawing and squealing and searching in the gutters for offal, not the adjutant bird, the gigantic crane—of which there are always a few on the bank of the river and the garden of the government house. During the season of the [illegible] they [illegible] great numbers, and perched on the loftiest buildings [illegible] for ornamental urns. Some of smaller variety yields the beautiful marabout feather.

Calcutta, a few statues of former governors, a handsome column on the upper part of the plain, erected in honour of General Ochterloney, who signalised himself in the Nepaul war. Of churches there are, within the limit of the ditch, six Episcopalian, six Roman Catholic; one Armenian, one Greek, two Independent and two Baptist chapels

To the public schools and colleges, I can only refer at present for want of space, leaving the notice they merit to a future letter

LECTURES TO WORKING MEN.

THE UTILITY OF GEOLOGICAL MAPS.

On Monday evening, March 1, Professor Ramsay delivered a highly-instructive lecture on the Utility of Geological Maps, at the Museum of Practical Geology, Jermyn-street—being the fourth of the course of lectures now in progress of delivery at that institution

[illegible] our readers, that there has for some time past been in course of preparation a most complete map of the geological condition of this country, from actual survey made by competent individuals, who are still engaged in the work, the expenses of the survey being paid by a grant of money annually voted from the public purse by the House of Commons—a grant respecting the utility of which there can be no differences of opinion.

The object of the learned professor's lecture was to show the great practical value derivable from such a map, by means of which we are enabled to obtain correct information regarding the great sources of our national wealth, coal, iron, and other mineral productions.

Our report of the lecture will necessarily be a brief one, as it would be impossible for us to follow the lecturer

throughout, without reference to the splendid collection of coloured diagrams illustrative of the geological strata of various sections of our islands; and a lengthy report will not be needed, inasmuch as the pith of the whole subject resides in a very small compass. We will, therefore, first give a copy of one of the diagrams, illustrative of the succession of geological strata occurring in Great Britain, and having named some of those parts of the country where certain of these strata may be found, proceed to point out the useful results to be obtained from the construction of correct geological maps.

SUCCESSION OF STRATA.

Pleiocene	New Red Sandstone
Crag	Permian
Eocene Freshwater	Coal
London Clay	Millstone Grit
Chalk	Mountain Limestone
Upper Greensand	Old Red Sandstone
Gault	Devonian
Lower Greensand	Killas
Wealden	Ludlow Rocks
Portland Stone	Silurian
Kimmeridge Clay	Wenlock Rocks
Coral Rag	Caradoc Sandstone
Oxford Clay	Llandeilo Flags
Bath Oolite	Cambrian
Inferior Oolite	Hurnant Limestone
Lias	Metamorphic
Keuper	Granitic

Beginning with the strata at the top of the list, and which are of the most recent formation, we find these deposits occurring in the Isle of Wight and the adjacent counties of Hampshire and Dorsetshire; they appear in the metropolis and in its vicinity—the valley of the Thames, comprising the entire county of Middlesex, with portions of Essex, Kent, Surrey, and Sussex; they reappear in the crag of Norfolk and Suffolk, and are traced in Yorkshire, and in part of Scotland. The chalk succeeds, occupying portions of Sussex, Surrey, Kent, Hants, Dorset, Wilts, and dipping under the valley of the Thames, occurs north of London, in the counties of Hertford, Bedford, Buckingham, Oxford, Norfolk, Lincoln, and York. The local deposits of the weald fill up the interval between the chalk hills of Surrey and Sussex, known as the North and South Downs, and appear, to a slight extent, in Wiltshire The oolite system follows, and commencing with Isle of Portland, pursues a devious and winding course through the heart of England, from our south-eastern to our north-western shores; proceeding through the counties of Dorset, Wilts, Berks, Gloucester, Oxford, Rutland, Northampton, Lincoln, and York, where it terminates in the vicinity of Scarborough The lias succeeds in order, and commencing at Lyme Regis, in Dorsetshire, follows a similar and uneven course, in the same direction, through the counties of Dorset, Wilts, Berks, Somerset, Gloucester, Warwick, Leicester, Nottingham, and Lincoln, into Yorkshire, where it is traced to the sea-coast, and the cliffs of Redcar, near the mouth of the Tees. The new red sandstone, the succeeding member in the series, commencing in the vicinity of Exeter, and pursuing a similar direction through the midland districts, traverses the counties of Devon, Somerset, Warwick, Stafford, Nottingham, Lancashire, Cheshire, and Cumberland, where it gives place to slaty rocks of older date. The magnesian limestone, an associate deposit, is developed from the Trent to the Tyne, in the counties of Nottingham, Shropshire, York, Westmoreland, and Durham The coal formation, the next in the sequence, follows no regular course, but is distributed in local areas, called basins from their forms. The principal, commencing with the south, are those of Somersetshire, Gloucestershire, North and South Wales, Worcestershire, Staffordshire, Warwickshire, Leicestershire, Derbyshire, Nottinghamshire, Lancashire, Yorkshire, Cumberland, Durham, and Northumberland, and in Scotland, those of the Forth and Clyde, with others in various parts of Ireland The old red sandstone is developed in Devonshire, Herefordshire, Monmouthshire, and Shropshire; and in Caithness, Cromarty, and other parts of Scotland. The silurian, the succeeding term in the order, occurs in Gloucestershire, Worcestershire, Staffordshire, Herefordshire, Shropshire, Radnorshire, Montgomeryshire, Caermarthenshire, Breconshire, Pembrokeshire, and Monmouthshire.

The Cambrian and Cumbrian systems consist of masses of subcrystaline and slaty rocks, developed in the county of Cumberland and in Wales, and the mica-schist, gneiss, and granite formations occur in the Highlands and western isles of Scotland, and in Ireland; the whole series forming, with one or two trifling omissions, a complete epitome of the physical geography of the whole earth, and in the comparatively limited extent of a few hundred miles, comprising such deposits, and bestowing such blessings as in other and less favoured regions are only to be met with spread over extensive continents and much larger areas of the surface of the earth.

A reference to a geological map will serve to show that different strata, as well as different minerals, are found not in each, but in different districts. Thus—Staffordshire, for instance, possesses beds of coal and iron, and the island of Portland abounds in the valuable limestone named after it; but there is neither coal nor iron in Portland, nor Portland stone in Staffordshire.

Each of these various strata is distinctly characterised by the presence of certain species of fossil remains, which lived and died on that particular strata, and the presence of these fossils is the surest indication we possess of the peculiar nature and character of each strata

The lecturer pointed out that these strata were of two kinds; the one formed by the action of fire, and thence termed igneous; the other by deposits of earthy substances carried into the beds of seas of fresh-water lakes by the various streams running into them, and which strata, by the action of natural phenomena, become either elevated or depressed, as the case may be.

One of the most important uses of a geological map, is to guide us safely in our search for coal and other mineral treasures, and thus prevent the great loss both of time and money which sometimes occurs from our want of that information which the study of geology and such maps are calculated to afford us.

Some of our coal fields are beginning to be exhausted—as, for instance, in Staffordshire, and it becomes a matter of great national importance to know where fresh search should be made, with any probability of success, for this valuable mineral production. Thus, for instance, there often occur in the coal districts what are termed *faults*, or dislocations, which interrupt the continuity of a bed of coal. The strata, which once were continuous, become dislocated or displaced, either by the subsidence or falling down of the strata on one side of the fault, or their elevation on the other These interruptions are sources of considerable difficulty, and often suddenly deprive the miner of the treasure of coal which he has found An accurate geological survey of the strata is the best guide to direct us where and at what particular points to sink the shafts, so as to get at the coal contained in the strata which have been dislocated by the occurrence of these faults.

So also with regard to the "dip" of strata, a man may be aware that coal has been found on his neighbour's estate, and he may, therefore, expecting to find some of this useful fuel on his own property, set about digging for it without success, and at a great outlay It may be that the dip goes away from his estate, or that, though the coal does actually pass under his land, he does not sink his shaft at the right spot *

The Northampton folks once thought that they had got hold of a valuable bed of coal, and a company was formed, and a large expenditure of money made to no purpose They had found some shale which bore resemblance to the shale of coal measures, but had they examined the fossils brought up from the lias strata in which they were boring, they would have known that the coal, if any, was far too deep below the surface to be worked with profit at the point where they were sinking. Of course no coal was found; so the sharp adventurers, after expending £30,000, finding that the gold was going and the coal not forthcoming, hit on the roguish scheme of *putting some real coal down the shaft*, which, when drawn up, was paraded through the town with colours flying and bands of music playing. The shares rose to a premium—the speculators sold out—and the bubble burst.

To prevent such disappointments and waste of money and of time, one of the surest means is that of constructing geological maps from accurate survey of the various strata of which each particular district is formed.

* up the other" In this case the edges represent the "dip," and the line course of the strata. It would be of no use to look for coal *outside* the n, however near the "dip," nor would it pay to sink through the dist represented by the middle of the basin to get at the coal beneath.

THE CHANCELLOR DE L'HOPITAL DURING THE MASSACRE OF ST. BARTHOLOMEW.

THE Chancellor dé l'Hôpital was one of the finest characters to be met with in French history. He for a long time filled the office of Chancellor under Catherine de Medicis during one of the darkest periods of her government, and, although himself a sincere Catholic, he endeavoured by his wise counsels to moderate the furious bigotry of the queen against the Huguenots His efforts were, however, in the long run, unsuccessful; and when it was found that he could not be gained over so as to take part in the execution of the infamous design of the guises, he was in 1569 dismissed from the chancellorship. "I am," said he, in writing to the queen soon after, "more than sixty five years old; I have a son-in-law and five small children dependent upon me for support; my house is falling into ruins; and if your majesty does not assist me, I must endure with patience for the few years I have to live."

When the massacre of St. Bartholomew took place, he was living in retirement at the Chateau of Vignay, in the environs of Etampes, with all his family around him, except Madame Herlant de l'Hôpital who was in Paris. The populace of the town, suspecting him of favouring the Huguenots, surrounded his house, and hung a great number of his tenantry. His servants were arming themselves and making preparations to defend the chateau, but he would not hear of it. On the contrary, he gave orders to open the great gate and admit the mob, lest the other should not prove large enough; and calmly said, that if his last hour was come, he was prepared to meet his fate with courage and resignation. While his family were in this state of dreadful suspense, their alarm was still further increased by seeing a small troop of cavalry approaching in the distance, for such was the dreadful state of the times that it was impossible to say whether they would prove friends or enemies. But, on their arrival, it turned out that they had been sent by the queen specially for the defence of the chateau.

Our engraving is taken from a painting exhibited by M. Decaisne, in 1850, at the Palais National in Paris, and was the object of general admiration. The silent and calm heroism of the old man; the agonized despair of the women and children; the excited anxiety of his son-in-law; and the compassion of the domestics are depicted with wonderful truth.

THOMAS MOORE.

A BRIGHT star has fallen from the glorious constellation of genius which shone with such brilliancy when George III. was king. Of those who, forty years ago, poured out such a glittering tide of song—Byron and Southey, Wordsworth and Campbell, Coleridge and Scott, Tom Moore and Rogers, only the last remains among us. Thomas Moore, the author of the Irish Melodies, died at his cottage at Slopperton, near Devizes, in Wiltshire, on Thursday, the 26th day of February, 1852, in the 72nd year of his age.

For nearly sixty years has Thomas Moore been before the world as a poet. He was born on the 28th of May, 1780, in Angier-street, Dublin, where his father, a strict Roman Catholic, carried on a grocery and spirit business. As a child, young Moore is said to have been remarkable for personal beauty, but his appearance in after life hardly carried out the promise of his infancy. He was short, with a rather heavy, expressive, but not handsome face, which, however, lightened up wonderfully when engaged in animated conversation, or singing his own ballad poetry. He was educated at Dublin, and one of his first noted peculiarities was a fondness and a talent for private theatricals. The act of Parliament having opened the University to Roman Catholics in 1793, the young poet immediately availed himself of his opportunity. The year following his admission, while still a child, he wrote and published a paraphrase of "Anacreon's Fifth Ode," and then proceeded to the translation of other odes by the same poet, for which he vainly hoped the university board might deem him "deserving of some honour or reward." Disappointed in his expectation, he nevertheless continued his task, and occupied himself in improving his verses and illustrating them by learned annotations, until he reached his 19th year, when he quitted Ireland for the first time, and set out for London "with the two not very congenial objects of keeping his terms in the Middle Temple and publishing by subscription his translation of Anacreon." The translation duly appeared in 1800. It was dedicated to George IV., then Prince of Wales, who, we may remark, received no further honour at the poet's hands.

The Anacreontic paraphrases—for they were little more—so took the public taste, however, that they were speedily followed by other and still more attractive verses. In the days of the Prince Regent it was not unusual to reward poets with official posts. Thomas Moore had therefore the misfortune to obtain the patronage of the government of the day—a government he had already shown his willingness to serve by the publication of several political squibs and pamphlets. In 1803 he was appointed Registrar to the Court of Admiralty at Bermuda, a singularly inappropriate situation for a man whose imaginative mind was imbued with classic lore and poetical romance. It has been an enlightened custom to reward literary genius by such cruel contrivances! Theodore Hook in his youth went to the Mauritius, under government auspices, and when he died in his age, government seized upon his rags to compensate itself for the natural results of its own unjustifiable folly. Moore accepted the post, went out to the islands, took a glance at them, appointed a deputy, made a rapid tour through the United States, and came home again.

The effect of the voyage was to subdue the admiration with which he had previously regarded "American institutions," and the publication in 1806 of two volumes of "Odes and Epistles." The well-known "Canadian Boat Song" owes its origin to this tour. In his passage down the St. Lawrence, Moore jotted down in pencil, upon a fly leaf of a volume he was then reading, both the notes and a few of the words of the original song by which his own boat glee had been suggested. The volume was given at parting to a fellow-traveller as a keepsake. Years afterwards the book found its way back to its former owner, who, to his great surprise, discovered that the *music* of this celebrated glee was actually as much his own as the words. In the original note to the song the reader is informed "that the words were written to an air which the boatmen sang to us frequently." Extraordinary as it may appear, the air had never been heard at all until Moore presented it for all time to the lovers of plaintive song and romantic imagery.

Two years after the publication of the sketches descriptive of the poet's travels, the world was taken by storm by the "Works of the late Thomas Little," a gentleman "who gave much of his time to the study of the amatory writers." There is reason to believe that Moore heartily repented ever having written these poems, which are of a character scarcely to be defended. In fact, Moore himself, in one of his prefaces, which contain, as it were, the history of his life, acknowledges them to have been "the depravity of an imagination which had become the slave of the senses." Thomas Little is little read by the present generation.

Soon afterwards, a savage review in the *Edinburgh*, of a republication of "Juvenile Songs," &c., led to the celebrated rencontre between Moore and Jeffrey, at Hampstead, when the great critic, as Byron asserted, stood valiantly up—

> "When Little's leadless pistol met his eye
> And Bow-street myrmidons stood laughing by."

The affair was ultimately made up, mainly through the intervention of Mr. Rogers; and at his house Moore shortly afterwards made his first acquaintance with Byron and Campbell. The long and affectionate intimacy between the subject of this sketch and the author of "Childe Harold," which resulted from the meeting, we need not more than allude to. Moore about this time married. His wife was a Miss Dyke, a lady of strong sense and character, as well as great beauty and amiability. The last survivor of their offspring is unhappily no more.

The publication of "The Irish Melodies" commenced in 1807, and, continued at intervals, was concluded in 1834. They have been translated into Latin, Italian, French, and Russian, and are familiar as proverbs amongst the fair countrymen of the poet, and indeed wherever English is understood and music loved. A lengthened criticism of these admirable songs—now sparkling—now plaintive—here glowing with fervour—there laden with pathos—all teeming with exuberant illustration—is scarcely needed here. It is difficult for the critic to refer to them in too high a tone of panegyric. It may be true that force and dignity are wanting to some of those lyrics, that occasionally fancy labours until art becomes too evident in strained and frigid similes, that ornament at times overlays sentiment until nature pants beneath the glittering encumbrance, but it is equally certain that universal literature does not present a lovelier and more affecting tribute to a nation's minstrelsy than is found in "The Irish Melodies" of Thomas Moore. The love of country that pervades and inspires his theme, his simple tenderness of feeling, that at once strikes the heart as instantly to melt it, his facility of creation, linked with the glad appreciation of all that is beautiful in nature—the grace, the elegance, the sensibility, the ingenuity, that are never absent—the astonishing and thoroughly successful adaptation of sense to sound, of sweetest poetry to thrilling music—are claims to admiration which the most prosaic of his species will find it impossible to resist or gainsay.

His great success determined Moore to attempt a poem of the dimensions which Sir Walter Scott has declared to be "the regular poetic standard;" and in 1812 he determined to write an Indian poem. Mr. Perry, of the *Morning Chronicle*, accompanied the poet to the Messrs. Longman, and through his intervention the great sum of 3,000 guineas was settled as the price of the poem, not one line of which was as yet written. Moore then retired to Mayfield Cottage, a desolate but beautiful place in Derbyshire, and after a long and hard struggle with a coquettish muse, forth—a

—came "Lalla Rookh." Its success ran rapidly through several editions, placed upon a higher and surer pedestal than ever. The bright fancy and immense command of imagery of the poet were now at their climax. The tales were the triumph of poetic beauty, but not a few old judges stigmatised their taste by preferring Fadladeen and his criticisms, even to the Fireworshippers, or the tribulations of the Peri. We need hardly say that the judgment of these tough old critics has now a far greater number of adherents than it once commanded.

In the autumn of 1817 Moore visited Paris with Mr. Rogers, and arranged the materials for his celebrated "Fudge Family," a satire written on the plan of the "New Bath Guide." Its popularity was almost equal to that of Lalla Rookh, and the

poet was everywhere received with the greatest favour. In 1819 he went abroad with Lord John Russell, and visited Lord Byron in Venice. He had made the acquaintance of the "poet among lords" in 1812, as we have seen, just after Byron had written his "Childe Harold;" and the meeting in Venice served to cement a friendship, which, already warm, lasted till death divided them.

Returning from Rome, Moore took up his abode in Paris, in which capital he resided until the year 1822. The conduct of the deputy in Bermuda had thrown the poet into difficulties, and until he could struggle out of them, a return to England was incompatible with safety. There were not wanting friends to run to the rescue, but Moore honourably undertook to provide for his own misfortunes. Declining all offers of help, he took heart, and resolutely set to work for his deliverance. After much negotiation, the claims of the American merchants against him were brought down from 6,000 guineas to 1,000. Towards this reduced amount the friends of the offending deputy subscribed £300. The balance (£750), was deposited "by a dear and distinguished friend" of the principal in the hands of a banker, to be in readiness for the final "settlement of the demand." A few months after the settlement was effected, Moore received £1,000 for his "Loves of the Angels," and £500 for the "Fables of the Holy Alliance." With half of these united sums he discharged his obligation to his benefactor.

Great poets are, for the most part, masters of prose. In 1827, Moore appeared before the public as the author of a prose romance. The "Epicurean," intended originally to be written in verse, retains the essential beauty of a poem. It reproduces the feeling and fancy of "Lalla Rookh," its soft and glowing colouring, and all its erudition. The spirit is borne along in the perusal with a soothing, dreamy, fascinating motion, yet is sustained throughout by lofty, wholesome, and consolatory thought. In the "Epicurean" Moore made amends for the levities of his youth, and for once the fancy of the poet was sublimed by the moral and religious aspirations of the teacher. Love had ceased to be mere gallantry. It is here the noblest, purest, best of human passions. The discontent of the Athenian philosopher has uneasy longing after immortality, his communion with the devoted Alcithe, more angelic in her nature than the angels of the poet—her Christian martyrdom—his own death, are all described with masterly skill and with the finest perception of moral and artistic beauty. If the eye of the sensualist is too palpably evident in many of Moore's metrical compositions, it is altogether invisible in the ethical romance which is consecrated to piety alone. Seldom has poet ever presented herself in more [illegible] guise.

In 1831, previously to the publication of "[illegible]nem," Moore wrote a "Life of Sheridan," in 1830 he issued his "Notices of the Life of Lord Byron," and in the following year the "Memoirs of Lord Edward Fitzgerald," in all the biographies sustaining his well-earned position. In his "Life of Sheridan" he did not shrink from the difficulties of his task. To borrow the language of a critic of the time, "he did not hide the truth under too deep a veil, neither did he blazon it forth." With regard to his "Life of Lord Byron" much might be said. The memoirs entrusted to Moore for publication were sold to Mr. Murray for £2000; but the relatives of the lord, fearful of too great exposures, induced Moore to stop their issue. It is to be regretted that he listened to the persuasions of those who were actuated rather by a sense of their own importance than by any regard for the dead poet. Moore recalled the manuscript and destroyed it, though he had to borrow from Messrs Longman the money with which to repay Mr. Murray. There were, and are to this day, many opinions as to the moral right which Moore or the relatives of Byron had to take the step they did.

The History of Ireland, published in "Lardner's Cyclopædia," and occasional political squibs—the last of which, referring to the Anti-Corn-law League, appeared in the *Morning Chronicle*—were the final works of the great bard.

For many years in the enjoyment of a pension conferred upon him by his political friends, Moore quietly resided in his cottage near Devizes, in Wiltshire, from which he occasionally emerged to find a glad and hearty welcome among the best-born and most highly gifted of his countrymen. During such temporary separations from home it was the habit of the poet to correspond daily with his wife. The letters written at these times, and abounding with interest, are preserved, to be incorporated, we trust, in the diary of his life, upon which Moore, as lately as 1847, was busily engaged, and which even then had made great progress. Mrs. Moore survives her husband, but his four children have preceded him to the grave. His eldest son died in Algiers, in the French military service. His second son, John Russell Moore, the godson of the late Premier, died, it is believed, in India. For many months before his own decease the health of the poet was in a declining state; and his dissolution, when it came at last, was not unexpected by his immediate friends. Peace be to his manes.

To enter into a critical disquisition of his merits as a poet, would be beside our purpose. "Within his sphere," says a recent writer, "he is unapproachable. He has little in common with the stormy passion of Byron; the philosophical grandeur of Coleridge is unknown to him, the muse of Scott and his own are scarcely kindred cousins, his productions have as little of the dreamy and mystical splendour of Shelley as they are allied to the elaborate and rather fatiguing epics of Southey, but within the circle of his own uncontested dominion he has poured forth strains as exquisite as any fancy ever clothed in sparkling words, or touched the human heart of man. The mind of Moore, from the moment that he took pen in hand, may be said to have been always in a state of pleasure. He has written dances as well as songs, and dealt with themes both sacred and profane; he has described the loves of angels and the holy piety of erring mortals; but, whatever the employment, one condition of feeling is always manifest. Most musical, most happy was his genius, and music and joyousness are careering in almost every syllable that he spoke. If what we have said be true, it is not difficult to ascertain the appropriate place of Thomas Moore among the worthies of his time. The poet of the Fancy, not of the Imagination—now delighting by ingenious creations, now astonishing by daring imagery, now melting by simple tenderness, and now winning every heart by the sheer utterance of soft melody—there is more of enchantment than of power in his verse, and less of the dignity of his vocation visible in his march than of positive pleasurable emotion. Of all the passions of the human heart, Moore has been chiefly, if not exclusively, engaged in delineating the passion of love. Other poets have recurred at intervals to the subject which he never quits, but, much as the author of 'Lalla Rookh' has dallied with the heart's paramount passion, he has never ventured into its most solemn depths, or busied himself with its loftiest emanations. More contemplative, but less brilliant and excited spirits, have found entrance to the mysteries to which, from first to last, he had neither ability, nor temper, nor force of will to penetrate."

Strictures have been made on the moral tendency of several of Moore's poems. It is certain that he has said much to encourage the hatred of the Irish towards "the cold-hearted Saxon,' and to urge them on to "flesh every Irish sword to the hilt.' It is a fact, also, that his Anacreontic effusions have done much to keep alive the fatal drinking customs of our country. It is to be lamented that in writings of such exquisite purity as those of Byron, Shelley, Moore, and others, there should be found passages calculated to excite and foster some of the worst passions and feelings of our nature. On this subject the late Bishop Porteus remarks, "The contagion of a licentious publication, especially if it be in a popular and captivating shape, knows no bounds; it flies to the remotest corners of the earth, it wings its way into the cottage of the peasant and the shop of the mechanic, it falls into the hand of all ages, ranks and conditions."

LENGTH OF THE DAY.—That the day is longer or shorter as you go north or south of the equator, is a familiar fact to our readers. Off Cape Horn, fifty-six degrees south latitude the days in mid-winter are about nine hours long. The longest day in London is sixteen and a half, at Hamburgh seventeen hours, at St. Petersburgh, the longest day has eighteen hours, and the shortest five, at Tornea, in Finland, the longest day [illegible] and a half

A NIGHT'S ADVENTURE.

MANY years ago a young man was walking home from his place of business, when he met with a little adventure. He was a quiet, well-dressed youth, with something of a gentle sadness in his manner that was far from disagreeable. And his habits were so regular that his landlady used to prepare his tea punctually at seven o'clock every evening, just as the muffin was ready there came his knock at the door, as

regularly as clockwork, indeed, rather more regularly than the widowed lodging-house keeper's clock, which required a good deal of looking to and some nice calculation before the truth could be fully arrived at. But on this evening the tea was made, and got cold on the hob, and the muffin dried almost to a cinder before the fire, and the good old lady began to be in great fear for the safety of her regular lodger. Hours passed away; the young gentleman's slippers

young gentleman found his way to Paradise-row, Pentonville; and the landlady at last went to bed in great trepidation, and left her door partly open, that she might wake up at his first knock, for our regular young lodger from the city was far too regular to require a latch-key. The landlady went to bed and fell into an uneasy sleep, and woke at intervals and listened; but no young gentleman came home that night. And when he did come in the morning, his eyes were bloodshot, and his clothes were soiled with travel; and he was, moreover, accompanied by a man somewhat older than himself, at whose face and appearance the good old landlady looked somewhat curiously—not to say suspiciously.

No words of explanation were asked or offered; for there was that in the faces of the two that effectually awed the

arrulous old lady into silence. The lodger led his guest to s own apartment on the first floor, which both entered. reakfast was ordered, and in course of time it came and as despatched—not an ordinary breakfast, with just an egg two and a cup of coffee, but a real substantial meal, with illed chops and ham, and cold beef and brown bread and utter. Of course, the landlady was immensely curious to now what all this might mean; but as no conversation passed tween them while she was by, her curiosity was by no eans allayed. Indeed, it was only excited the more, as e noticed how voraciously the stranger eat of the various ands on the table—now a chop and a great gulp of coffee; en an immense slice of cold beef with a piece of bread to

lady fixed upon him. The mutual glance was instantaneous, and the landlady withdrew in evident confusion, closing the door behind her.

"I should know that woman anywhere," says the stranger, in a harsh voice, and dropping his eyes upon the ground; "it won't do to stay here."

The other made no reply, but looked towards the door, and nodded slightly. Meanwhile the landlady, who had heard the observation of the stranger, went noisily down stairs, but presently crept stealthily back again with the maid servant. "Look there," she whispered to the girl, and pointed to the keyhole; "do you think that you would know that man again?"

natch; and again a rasher of hot ham, large enough for wo. It was very strange. And she noticed too, that the ppetite was all on one side of the table; and that the lodger—whom we will call Joseph Praed—sat quite quietly in his easy chair, balancing a cup of coffee in his hand, and watching the other as he eat and drank. A smile came every now and then on Joseph's face, which otherwise was sad and gloomy, but the landlady was so accustomed to her young odger's silent moods that she durst not question him at such imes. At length the breakfast drew to a close, and the stranger lifted up the corner of the tablecloth to wipe his nouth, raised his head and encountered the eyes of the old

The girl stooped down to the orifice and put her eye to it; not for the first time that morning, but scarcely had she been a moment in that position, when the bell from within was violently pulled. Mistress and servant started back aghast; but quickly recovering their presence of mind, crept down stairs again. "Do you go up this time, Hannah, and take a good look at this horrid man: there can't be no good in such goins on, I'm sure."

But by the time the maid got up stairs, both the young men had vanished, and she heard the key turn in the lock of the lodger's bedroom.

It was certainly curious—very curious. "For Mr. Joseph

to go and stay out all night, and then come in in the morning lookin' as aggard as a ghost, and bringing back with him such a wild vagabond-lookin' felter, with his face all covered with hair, and nothing but rags on his back. Don't you think, Hannah, we better send for the p'lice?"

"I'll tell you what, ma'am," replied the maid, who was unwilling to annoy the young lodger who had given her so many presents, and always spoke so kindly to her—"I'll tell you what; hadn't we better wait a little, an' see what they do by-an'-by?"

But little time, however, was left for cogitation, for the bell rang violently again, and Hannah going up hurriedly, heard a strange voice inside call out, "Hot water!"

All that day the two women passed quietly up and do stairs, and wondered greatly to themselves what it all meant. It need scarcely be said, that all manner of guesses were made, and all kinds of strange suggestions were hazarded, and that not one of them approached the truth. Dinner-time passed, and tea-time and supper, but no further summons to the bedroom. And in spite of the most persevering peeping and inveterate listening at the key-hole, they remained still in a state of the most disagreeable suspense and uncertainty. At length, while they were both in the kitchen, thinking whether this mystery would ever be cleared up, Mr Joseph's bell rung. The landlady hastened up with as much speed as her rheumatism would allow.

She entered the room, which was neat and clean as usual—everything in its proper place, and there was Joseph sitting on the side of the bed, but *the stranger was gone*.

"Mrs. Clark!" said Joseph, in his usual voice, and without paying the slightest attention to her scared look and pale cheek, "I wish you would get me a little supper—soup, or gruel, or something of that sort, I'm tired."

"And so you must be, sir, up all night," began the garrulous old woman. "Why, what's happened?"

The young man looked up at his landlady. Their eyes met, and there was such a sad and meaning expression in his quiet features that she forebore all further questions.

* * * * * *

Six months passed away, and Joseph went and came as usual—the same quiet, unobtrusive, self-denying fellow—and no word or hint escaped the pair of the doings of that night. The widow, however, could not help cogitating and speculating, in her own way, on the curious affair. She never talked about it to anybody, and actually discharged Hannah for mentioning the circumstance after being told not. From half-past nine to seven, the house was one great puzzle to the landlady, and from seven to half-past nine was she burning for its solution. But she dared never ask the lodger, which only made the matter a thousand times worse. She thought, too, that he was getting thinner, and lived less expensively of late,—in fact, she was positive of the last, for he gave up eggs for breakfast, saying that they disagreed with him. He smiled less often too, and seldom cared to enter into conversation with her when she waited on him at teatime, but would set up late at night reading. But she knew that he took less pleasure in his book than he used to do, for the "Westminster" and "Blackwood" would often go back to the library with only half an article cut through.

"He's got somethin' on his mind, I'm certain," the widow would say to herself. "I know it's all along o' that black-bearded, dirty fellow. I wonder who he was?"

And for once the old lady was right, Joseph *had* something on his mind which he could'nt keep there, and as he had no friend in the world to whom to communicate his thoughts—the clerks were too young and thoughtless, and the fellows at the club too full of their own affairs to care about his,—so one quiet evening in autumn, when the full moon was shining right into the room, he called his landlady up stairs.

"Sit down, Mrs. Clark," said Joseph.

And Mrs. Clark did sit down, and folded her silk dress as if she had determined to listen with all her might.

"You recollect the morning when I brought Ha——, a stranger—to my lodgings; and, after entertaining him and dressing him in a suit of my own clothes, I quietly let him out at the front door at night—"

"Well, now!" began the widow, "I often wondered how you managed—"

"To let him out?—Exactly. Well, I *did* let him out; and, now, as I knew you would sympathise with me,—and, as I don't like to hazard my reputation even with a——"

He would have said "lodging-house-keeper," but she stopped him with——"No, in course, pretty dear!"

Joseph passed his hand across his brow—for the widow's simple words brought back old times. "Well, Mrs. Clark," he continued, "if you feel inclined to listen to a sad story, I'll tell you one."

The widow settled herself more comfortably in her chair, and looked towards her lodger; but as he was sitting with his back to the window, and there were no candles in the room she could only just discern the outline of his face and figure, while the harvest moon shone full on hers.

"Ten years ago, when I first came to live in this house, Mrs Clark, you were not the mistress of it—"

The old lady assented with a nod.

"At that time, I think I was the happiest fellow in the world. It is the old story with a difference. I fell in love, and was beloved again. I need not tell you, who are old enough to be my mother; and I sometimes think I trace a faint glance of her kind face in yours—that, that—"

"In course, in course, and you made preparations to marry? Just as I did myself."

"Alas! it was not to be. Another came from far across the sea, and snatched the flower from my grasp."

"And you—"

"Became the thing you see. I did not break my heart, for I loved that other almost as well as I did her. And in course of time the wound upon my spirits began to heal, and I made friends with people who liked my quiet manners, and were kind enough to bear with my odd ways."

"Odd ways! I'm sure if they only knew you—"

"As well as you do, Mrs. Clark. Of course, of course, but everybody don't. Well, as I said, I was beginning to look upon the world as not quite so bad as I had once thought it, when, one night—it was a cold miserable night, in the very depth of winter—I shall never forget it—as I was coming out of the office door, a stranger darted out from a corner, and placed his hand upon my shoulder. I'm not nervous, but I felt, as the clammy fingers touched my cheek in passing, as if cold death were on my face. The stranger did not waste much time in salutation, but putting his cheek close to mine, whispered three words into my ear."

The widow became intensely interested, but did not speak.

"I felt as if a dagger pierced my side, and for a moment I could scarcely stand.

"'I have not seen them for ten days,' said the ragged messenger; 'but if you wish to look upon her face before she dies, come on.'

"I needed little other pressing, so I followed my strange conductor. On the way he told me that which I had feared for many a dreary day. Oh! I can never bring myself to describe the scenes of vice and infamy we two passed through. Streets with tottering houses, and cellars ankle deep in filth, we pushed our way into, my guide bearing about him a sort of talisman which bore us harmless through them all. St. Giles's, Whitechapel, Drury-lane, Clerkenwell, Smithfield, Westminster—we searched them all, a cab taking us as quickly as possible from place to place. In the lowest haunts of vice—among the thieves and beggars of the cheapest lodging-houses, and in the most horrible cellars, filled with men and women and children who looked more demon-like than human—through dark and noisome ways, where it was only broad enough for one to pass—among the ruins of whole streets pulled down, and dwellings of the very poor laid low and desolate—in stinking alleys, at whose lower ends the river flowed on dark and dreamily—in the sinks and sewers of iniquity we sought, and sought in vain. They we looked for were not there.

"It was by this time getting almost morning; but our search was not yet over. 'I only know of one more place they'd be likely to stop at,' said my guide, 'and that's the Mint.'

"'On Tower-hill?' I asked.

"The man looked at me, and almost smiled. And then,

lispering to the cabman, we were presently rattling over ondon-bridge. Arrived on the Southwark side, our further ssage was barred by the preparation for opening the Green- ich Railway, which was just then finished.

"'I think, gentlemen,' said the cabman, 'if you would pass nder one of the arches of the rail, and come out on t'other de, I could manage to meet you at the entrance of the arket.'

'Ah!' said my conductor; 'a good thought, cabby!'

With that I followed the strange man down Tooley- eet, and towards the railway. Then I asked myself, for e first time—was the story I had listened to all true? ould it be that one who had been bred in luxury had fallen low as to be sought where we had looked? And I esently called up all kinds of tales of assassination and bbery in low places at night. But still I followed the ange man. Followed him through all manner of strange nk passages and unknown ways. Now past the porch of a urch where groups of ragged mendicants were huddled to- ether for warmth, and where the little light there was only rved to make the picture more grotesque and hideous; now ong streets in which the workmen at the sewers had left wide asms and dangerous heaps of rubbish in the midst, now rough a narrow gateway where we had to pick our careful ay among decaying filth and oozing ponds of slimy mud, and here all beyond was dim and indistinct. At last we paused long the debris of what appeared a mason's work-yard.

sudden darkening of the little light of dawn made me vare that a roof was above us. I looked up—we were under ie of the arches of the railway. A moment more, and we id passed through the swarm of struggling wretches lying all huddled together for warmth—too poor to hire bed even in the miserable lodging-houses we had visited."

Joseph and the widow involuntarily shifted their seats, so at the face of the young man was for a moment turned wards the moon. She saw that the hot tears ran down his eeks, but did not interrupt him.

"As I said, I passed through the crowded arch, and ould have followed my guide, when a deep groaning sigh ose beside me made me suddenly look round. It struck my ear with a sort of pang, and, gazing downwards, I came aware that there were yet other wretched objects out- de the actual archway. A little removed from the throng, id leaning in various postures against the wall of a dilapidated uilding, I saw a mass of miserable creatures, as they seemed me, asleep. I hesitated a moment, and then stooped down examine them more closely. O God! I found the nearest -there in the midst of a pestiferous group of dozing beggars -he sitting on the ground with his head bent upon his chest- knew him at once, though ten long years of vice and want ad bronzed his cheek and paled his brow. But 'where was ie?' I could not have named her name to him at that mo- ient for the whole world.

"'There!' said he, pointing to a half-naked form beside im, whose arms were thrown above her head as if to rest, id whose long matted hair was floating down a face and neck s fair as ever.

"I stooped a moment to the ground: I looked into that face lovely once, and yet so fair: I put my arms around her to ise her head. Oh! why disturb so soft a slumber? I took er in my arms and carried her without the arch into the dim ruggling light. In the rapture of the moment, I was forget- ful of her husband's presence—for he had by this time risen o his feet—and gazing fondly on those lips I had so often issed, I pressed them once again to mine. From those dear ps a struggling sigh broke upward, mingled with froth and lood; and oh, Great Heaven, she fell back from my arms a orpse upon the ground!"

The tears no longer hidden, flowed down those wasted heeks, and Joseph Praed was not ashamed to show his deep motion before that aged woman.

"And he?" said she, at length.

"He it was you saw. He had been a wild, reckless gambler n foreign parts, and had dissipated all his wife's and his own ortune. At last he fell. Why need we talk any more about ?"

Mrs. Clark saw that he had a secret of his own he did not ish to reveal. She, too, had a secret which she kept to herself. During the narration, she had "put this and that together," as she said long afterwards, "and arrived at a conclusion."

* * * * *

In a little churchyard in Kent, there is a mound of [illegible] with flowers and sweet herbs in blossom constantly around it. Two gentle hearts are at rest within that grave. And on the little headstone are these words, and none others—

"In life divided, but in death united."

"And so," said Mrs. Clark to herself, when she came home from his funeral—Mrs. Clark is a very old woman now—"they two were BROTHERS. And my poor Joseph, so good and gentle as he was, actually spent all the money he was worth to send the wagabond of a forger out of England, and away from justice. Well, it's a curious world we live in."

THE POWER OF THE SUN'S RAYS.*

HEAT and light are derived from the sun, and we have attempted to show that not only are the phenomena of these two principles different, but that they can scarcely, in the present condition of our knowledge, be regarded as modified manifestations of *one* superior power. Associated with these two remarkable elements, others may exist in the solar rays. Electrical phenomena are certainly developed by both heat and light, and peculiar changes are produced by a short exposure to sunshine. Electricity may be merely *excited* by the solar rays, or it may flow like light from the sun. Chemical action may be only due to the disturbance of some diffused principle, or it may be directly owing to some agency which is radiated at once from the sun.

A sun ray is a magical thing. We connect it in our fancy with the most ethereal of possible creations. Yet in its action on matter it produces colour; it separates the particles of solid masses farther from each other, and it breaks up some of the strongest forces of chemical affinity. To modern science is entirely due the knowledge we have gained of the marvellous powers of the sunbeam; and it has rendered us familiar with phenomena, to which the incantation scenes of the Cornelius Agrippas of the dark ages were but ill-contrived delusions, and their magic mirrors poor instruments in comparison with the silver tablets of the photographic artist.

In the dark ages, or rather as the earliest gleams of the bright morning of industrious research were dispelling the mists of that phantom peopled period, it was observed, for the first time, that the sun's rays turned a white compound black. Man must have witnessed, long before, that curious change which is constantly taking place in all vegetable colours: some darkening by exposure to sunlight, while others are bleached by the solar rays. Yet those phenomena excited no attention, and the world knew nothing of the mighty changes which were constantly taking place around them. The alchemists—sublime pictures of credulous humanity—toiling in the smoke of their secret laboratories, waiting and watching for every change which could be produced by fire, or by their "royal waters," caught the first faint ray of an opening truth, and their wild fancy that light could change silver into gold, if they but succeeded in getting its subtle beams to interpenetrate the metal, was the clue afforded to the empirical philosopher to guide him through a more than Cretan labyrinth.

The first fact recorded upon this point was, that horn silver blackened when exposed to the light. Without doubt many anxious thoughts were given by these alchemists to that fact. Here was, as it appeared, a mixing up of light and matter, and behold the striking change. It was a step towards the realisation of their dreams. Alas! poor visionaries! in pursuing an ideality they lost the reality which was within their grasp.

Truth comes slowly upon man, and long it is before these angel visits are acknowledged by humanity. The world clings to its errors, and avoids the truth, lest its light should betray their miserable follies.

* From the "Poetry of Science; or, Studies of the Physical Phenomena of Nature." By Robert Hunt, Keeper of the Mining Records at the Museum of Practical Geology, Piccadilly.

At length a man of genius announced that "*No substance can be exposed to the sun's rays without undergoing a chemical change;*" but his words fell idly upon the ear. His friends looked upon his light-produced pictures as curious matters; they preserved them in their cabinets of curiosities. but the truth which he enunciated was soon forgotten. Howbeit these words were recorded, and it is due to the solitary experimentalist of Châlons on the Saône, to couple the name of Niepce with the discovery of a fact which is scarcely second to the development of the great law of universal gravitation. But an examination awaits us, which, for its novelty, has more charms than most branches of science, and which, for the extensive views it opens to the inquirer, has an interest in nowise inferior to any other physical investigation.

The prismatic spectrum affords us the means of examining the conditions of the solar rays with great facility. In bending the ray of white light out of its path, by means of a triangular piece of glass, we divide it in a remarkable manner. We learn that heat is less refracted by the glass than the other powers; we find the maximum point of the calorific rays but slightly thrown out of the right line, which the solar pencil would have taken, had it not been interrupted by the pri and the thermic action is found to diminish with much regularity on either side of this line. We discover that the luminous power is subject to greater refraction, and that its maximum lies considerably above that of heat, and that, in like manner, on each side the light diminishes, producing orange, red, and crimson colours below the maximum point, and green, blue, and violet above it. Again, we find that the radiations which produce chemical change are more refrangible than either of the others, and the maximum of this power is found at the point where light rapidly diminishes, and where scarcely any heat can be detected, it extends in full activity, above its maximum, to a considerable distance, where no trace of light can be discovered, and below that point, until light, appearing to act as an interfering agent, quenches its peculiar properties. These are strong evidences that light and actinism—as this principle has been named—are not identical. and we may separate them most easily and effectually from each other. Certain glasses, stained dark blue, with oxide of cobalt, admit scarcely any light, but they offer no interruption to the passage of actinism, on the contrary, a yellow glass or a yellow fluid, which does not sensibly reduce the intensity of any one colour of the chromatic band of luminous rays, completely cuts off this chemical principle, whatever it may be. In addition to these, there are other results which we shall have to describe, which prove that, although associated in the solar beam, light and actinism are in constant antagonism.

When Daguerre first published his great discovery, the European public regarded his metal tablets with feelings of wonder; we have grown accustomed to the beautiful phenomena of this art, and we have become acquainted with a number of no less beautiful processes on paper, all of which, if studied aright, must convince the most superficial thinker that a world of wonder lies a little beyond our knowledge, but within the reach of industrious and patient research. Photography is the name by which the art of sun-painting will be for ever known. We regard this as unfortunate, conveying as it does a false idea, — the pictures not being *light-drawn.* tures are *sun-drawn.*

By whatever name we determine to convey our ideas of these phenomena, it is certain that they involve a series of effects which are of the highest interest to every lover of nature, and of the utmost importance to the artist and the amateur. By easy manipulation we are now enabled to give permanence to [illegible] falls upon the table in its dark chamber, may be secured with its most delicate gradations of shadows, upon either a metallic or a paper tablet.

Thus we are enabled to preserve the lineaments of those who have benefited their race by their genius or their bravery. By the agency of these very rays which give life and brilliancy to the laughing eye and the roseate cheek, we can at once correctly trace the outline of the features we admire, and fill in those shadowy details which give the picture the charm of *vraisemblance.* The admirer of nature may copy her arrangements with strict fidelity. Every undulation of the landscape, every projecting rock or beetling tor, each sinuous river, and the spreading plains over which are scattered the homes of honest industry and domestic peace, intermingled with the towers or spires of those humble temples in which simple-hearted piety delights to kneel—these, all of these, may, by the sunbeam which illuminates the whole, be faithfully pencilled upon our chemical preparations.

To the traveller how valuable is the process! The characteristic vegetation of distant lands, and the remains of hoar antiquity, speaking to the present of the past, and recording the histories of races which have fleeted away, may be alike secured to instruct "home-keeping wits," by the assistance of this beautiful art.

SECOND SIGHT.

I am not over credulous, nor much given to believe in marvels of any kind. In these go-a-head days of science—mental and physical—ghostly appearances and other psychological wonders, which never challenged a doubt in the minds of our forefathers, have but few believers. I do not, however, so far commit myself to the scepticism of the age as to disbelieve, absolutely, everything which I cannot understand or account for. Supernatural phenomena, I am weak enough to reason, *may* be real and true, though above my comprehension. Still, I owe it to myself to say that, in such matters, as in everything else, I make evidence a condition of belief. In the instance of "second sight" which I am about to relate I have a personal knowledge of the individuals concerned, and in the character of the man whose experience the reader is to peruse a sufficient guarantee of its truth. Were it not for these facts, I should either meet the statements with unqualified disbelief, or endeavour, as the fashion is, to explain away the phenomena by some convenient optical theory. With this much of a preface, then, "*o nos moutons.*"

In Ireland—the home and birth-place of so many supernatural and lengendary wonders—and in the heart of an amphitheatre of hills in the north-west of Tyrone, is the little village of Castle-connor. It consists of a single street, fortified ("to keep out the devil," as an inhabitant would say) at its respective extremities by a Roman Catholic chapel and a Presbyterian meeting-house. Close by the burial-ground of the latter, runs a narrow but deep stream, called the *Faughan.* It is spanned by a single arch, whose dilapidated condition would excite just and urgent convictions of the necessity of repairs in this more matter-of-fact country, where human life is rather more highly valued, and where grand jury presentments are more faithfully executed. Practical conservatism, however, constitutes the social economy of Castle-connor. The "oldest inhabitant" cannot have the faintest memory of improvements of any sort. "The ould ways are the best," is the creed of its population, Papist and Presbyterian; changes, except such as time works, are, therefore, unknown. Three generations of worshippers have come and gone since the chapel was whitewashed or the meeting-house painted.

These facts, however, in the social history of the village, though characteristic and suggestive, claim only an incidental mention in this sketch. Still they are, in a sense, necessary to its completeness. Castle-connor has a monthly fair, which is chiefly attended by some of the wildest specimens of humanity which Tyrone, Donegal, and Fermanagh can produce. At these monthly gatherings, booth dances, elopements, and faction-fights, which in most other parts of Ireland are happily becoming things of the past, yet flourish in their pristine glory. Personal quarrels are thrown as contributions towards the getting-up of the general *melée*, in which the individual combatants satisfy their honour and pugnacious tastes by hitting a head wherever it can be found. On something of a similar principle, "attachments" are extemporised, an immediate run-away takes place, and marriage follows, with a rapidity and an utter absence of fore-thought, which in this

mercurial climate we cannot easily understand. Such, ertheless, is the social condition of the region I am describ- even in this go-a-head age of submarine telegraphs, rail- ds, "long ranges," balloons, and needle-guns. The case of econd-sight," however, which I am about to narrate had connexion with any of the periodic fights or love matches ich I have mentioned.

About an English mile from Castle-connor, lived, five years , a family called O'Neil. It consisted of the father and ther, two daughters, and a son. Some quarter of a mile tant, resided a second son, who had married, and, at the e I write of, held a small farm of his own. Through mis- nagement and neglect, however, resulting from the drunken bits of its owner, it yielded but little, and himself and his ily were thrown mainly upon his father for their support. s days were spent in lounging idly about home, and his nings and nights, for the most part, were passed in the pany of others like himself, in a sheebeen-house in Castle- nor. Persuasions, threatenings, and all other means likely influence him were tried in vain for his reformation. The est threatened him with the thunders of excommunication, d the land agent with ejectment from his farm; but with better result than a temporary suspension of his besetting actice, for which he subsequently repaid himself amply. All orts to win him from this fixed habit of drunkenness were length abandoned, and he nightly trod the bye-path along e banks of the Faughan, which led from his dwelling to the eebeen-house, in a state which fully justified the fears of his atives, that his body would some morning be found in the eam. Nevertheless, he generally managed to reach his me in safety before midnight at the latest. One fair-night, wever, the usual hour of his return had long passed, and he s still absent. After waiting anxiously till long after mid- ght, his wife, fearing the worst, went to the house of her her-in-law, thinking that he might have stopped there on s way home. On rousing up the inmates, their alarm was most equal to her own. A man servant was speedily spatched to Castle-connor in search of the absent man, but he turned without having been able to discover more than that had left his usual resort shortly after midnight, and had not ice been seen or heard of. Their worst fears now seemed stified The father, however, endeavoured to quiet their arm, and insisted on the other inmates of the family return- g to bed, whilst he and the man servant renewed the search. is they did by separating and taking each one of the two ays which led from the house to the village. The servant ent round by the road, and the father by the bye-path along e Faughan. The anxious family had returned to bed, but ot to rest, to await the result of this second search, and the married son, whom I have already mentioned, was lying cturing to himself the discovery of his brother's body in the ver next morning. Suddenly, however, these melancholy nagimngs were interrupted by a scene still more terrible. A ft, subdued light all at once sprung up, gradually increasing extent and brightness, till the bedroom became filled with radiance which made every object distinctly visible. The m outlines of a landscape were next painted on this ground- ork of light, gradually becoming, as it had done, fuller and learer, till a picture, complete in all its details, of the country etween his home and Castle-connor, was presented to his ew. Every hill, and ditch, and hedge, now was visible as the clearest sunlight. Each came forward on the scene, ike the successive phases in a dissolving view. The startled itness of the phenomenon at first thought that it was some ptical illusion, created by the reverie which it had inter- upted. He rubbed his eyes, closed them, then rubbed them gain; but still the scene was vividly before him. Being n intelligent man, and the reverse of superstitious, he lung to the notion that it was a mere illusion which would soon pass away. In this, however, he was disap- ointed. At the end of several minutes the startling pic- ure remained unchanged. As a last effort to shut it out rom his view, he buried his head beneath the bed-clothes, ut the supernatural panorama still continued visible. Every eature in the landscape seemed even more distinct than ts original at noon-day. About one-third of an Irish mile from Castle-connor, the Faughan is hid from view from O'Neil's house, for a distance of some hundred yards, by a hill, after winding round the base of which it again becomes visible, and runs nearly in a straight line for more than a mile. As the young man now lay half inclined to admit that there must be something "unearthly" in the matter, he observed a figure emerging from behind the hill, and approaching by the pathway along the banks of the river. As it came gradually nearer, he recognised *his father*, first by his gait, and next by his dress, both of which he could clearly distinguish in the strong light of the vision. On came the figure of his father, increasing in size and distinctness, till the knotted thorn-stick which he carried became easily recognisable too. The anxious son now watched the strange scene with painfully increasing interest; and, though he had found open or closed eyes the same as regarded its perception, he hardly winked, lest some movement or other incident should escape his observation. He had overcome the slight sensation of fear which had previously affected him, and now earnestly gazed at the figure, as if intuitively certain that it was to form the chief point of interest and importance in the scene. A few moments proved the justness of this expectation. His father seemed to approach home at his usual pace, till he reached a narrow foot-stick which spanned the mouth of a dyke that emptied itself at that point into the Faughan. In crossing it, the terrified son saw the figure stumble, and, after an attempt to regain its balance, fall over into the river. It sunk, but soon after rose to the surface, and clutched violently at the brush-wood which grew along the water's edge For a moment the effort seemed successful, but the twig which it had grasped gave way, and the figure fell back into the stream. A second time it rose to view, plunging far out into the river, as if making the last struggle for life, but in vain. The water closed over it, and a few bubbles rose over the spot where the death-agony had ended. The horror-stricken son waited for nothing more, but hastily jumped out of bed, dressed himself, and, without telling any of the family what he had witnessed, left the house to seek for his father. On the street he met the man-servant, who had found the missing brother lying drunk and asleep on the road to Castle-connor, and conveyed him to his own house, where he then was. The man knew nothing of his master. They had separated, as I have mentioned, to make the search by both ways to the village, and he had seen nothing of him since The son then mentioned the fearful vision which I have described, and stated the fears which it had inspired The terrified listener, who had performed countless crossings and other pious movements during the brief narration, proposed that the river should at once be dragged, on the strength of what had occurred, but it was agreed that they should both go to Castle-connor by the road, and there seek for the father. It was daybreak by the time they reached the village The old man had been in several houses during the night in search of his missing son, but nothing farther was known of him. The man-servant was sent back to see if he had reached home in the meantime, but his return with a negative answer now seriously aroused fears that an accident had in reality occurred. Guided by young O'Neil, a party of men went to the foot-stick on the bank of the Faughan *At the identical spot seen in the vision, the grass was found flattened down, as if by the recent pressure of some heavy body, and in a few minutes the agonised son, with his own hand, dragged up the corpse of his father from the river*

These are facts which I know to be true, and I challenge the scientific or philosophical sceptic to explain them away if he can. I have said that I am not much given to believe in wonders of any kind; but here are phenomena of actual occurrence, which I cannot account for on any principles which either science or philosophy, properly so called, can furnish in explanation. I was staying in the neighbourhood of Castle-connor at the time, and heard the facts from the lips of O'Neil himself, than whom, I am convinced, a more conscientious or upright Roman Catholic does not exist. His statements are yet corroborated by the men whom he first told of the vision before the discovery of his father's body, and so strongly was I impressed with a conviction of their truth when I first listened to them, that the impression of the terrible scene which was then made upon my mind, remains as fresh and startling as it was five years ago. With the amount of evidence which I possess, disbelief is to my mind impossible, however strange the facts, nor do I envy the

mental constitution or habit of the man who could take refuge in his fancied "superiority to superstition," and withhold his belief in the face of an equal weight of proof. Such phenomena as these are mysteries whose credibility only the presumptuous or the ignorant will rashly deny.

THE PRODIGAL.

BY MEA CULPA

SCENE.—*Night-time in a small attic chamber.—An old man alone*

"ONCE more the sun hath sunk to rest,
Numbering another day unblest
By receipt of the missive so much desired;
And hope's last gleam, well-nigh expired,
But serves to add a caustic pang
To disappointment's keen-edged fang
It is my wonted hour of prayer,
But, oh! not yet, my soul may dare
To pray for help, while, unresigned,
Such awful doubts disturb my mind.
Aye, thoughts of one now far away,
Depress my spirit night and day,
Of one, that from his birth hath been
The idol whose shadow e'er comes between
My soul and God. 'His will be d
Are words I cannot say, my son,
When thinking on thy winning ways
And merry laugh of former days;
Thy blithesome step, as hand in hand
We paced the lawn at day's decline,
And loving kiss when, thou in bed,
I blessings craved on thy young head.
Oh, boy, I dwell on all these things,
Until the lonely present wrings
My troubled heart, which then gives vent
To terrible presentiment
Perchance on couch of sickness laid,
With none thy feverish wants to aid,
No one to catch thy parting breath,
Or wipe away the dews of death,
Thy sire's forgiveness thou would seek,
And then my faith grows all too weak
To trust, in such dark bitter hour,
In the wisdom of Almighty power.
Oh, bitter is the bread of tears,
When eaten for nine weary years!
And each fresh dawn when tidings fail,
And the heart grows sick and the cheek turns pale,
My cup is filled afresh with woe,
Whose every drop is, like poison slow,
Corroding the springs of an old man's life,
With whom sorrow hath waged perpetual strife
Then, worse than all, comes the torturing thought,
With all its maddening anguish fraught,
What caused the soul of my innocent child
E'er to become by sin defiled?
Should he further stray —ah! heaven's! my brain
Cannot the mere idea sustain."

(*Here Mabel is heard singing in the adjoining apartment, and the old man opens his window to listen.*)

Once more hath darkness
Enfolded the earth,
Suspending our labours
And hushing our mirth,
And her thanks would a lowly maiden pay,
For all heavenly gifts vouchsafed this day!
In cities or deserts,
Wherever we be,
We know we're protected,
Oh, Father, by thee,
And duly our hymn of thanksgiving we sing.
Ere slumbering secure in the shade of thy wing
For the trials thou sendest,
Our weak faith to prove,
The blessings thou givest,
Our hard hearts to move,
And mercy held out to the vilest, we raise
Our vespers united of love, trust, and praise.

(*Old man, still at the lattice.*)

"Most truly hath our Saviour said,
A blessing rests on that man's head
Who shall, confiding, loving, mild,
Become again a little child!
Such only may aspire to heaven;
And my daughter's trust to me hath given
New faith this night, fresh strength to seek
From Him who will sustain the weak.
Those glorious stars! How duly *they*
Their Creator's will obey!
How will I try to kiss the rod,
And kneeling in the sight of God,
Will strive once more, with truth, to say,
'His will be done,' and then—yet stay,
Surely, beneath yon old elm tree,
Some way worn traveller I see
Benighted on this lonely moor!
Well, be he rich or be he poor,
He must be cared for ere I sleep,
Or even pray for him for whom I needs must weep
——— Ho! Mabel, ho! I now desire
Thou wilt prepare food, bed, and fire."

(*The old man is next seen in the open porch, beckoning to the wayfarer, who seems to hesitate, then rushes forward and kneels at the old man's feet.*)

"Father, *my* father, didst thou call me,
Me, thy vile and erring c
Thus penitent I come before thee,
A deeply sinning, worthless son.
Oh! how the black ingratitude
With which from this dear home I turned,
And the rough defying mood
In which thy gentle rule I spurned,
Bows down my soul in fear and shame
And thy tear drops caressing
My hot brow with their blessing,
More severely reproach me than blame
Thou too indulgent, best of fathers,
Can thou love me as of yore!
One word now, one word of kindness,
Would virtue to my soul restore
I have sinned against heaven and thee,
Wilt thou, dost thou, pardon me!"

OLD MAN.

I do, I do, my son!
Thank God, thank God, who hath restored
My long lost child, so oft deplored
Oh! welcome to this roof again!
And doubt thou not, that sin's worst stain
By purity may be redeemed
How faint thou seems—aye, rest
Thy head once more on this fond breast.
Quick, Mabel, bring the best spiced wine,
And roast the fattest tenderest chine,
Our wanderer is returned at last,
And all the miserable past
Is buried in grateful gladness of heart,
That he hath chosen the better part
And were it God's will that my life should cease,
I could now depart in perfect peace;
For bright is the morrow and dear the thought,
Of an endless future with sweet hopes fraught.

THE TITLE OF ESQUIRE.—Real esquires are of seven sorts. 1 Esquires of the King's body, whose number is limited to four 2. The eldest sons of Knights, and their eldest sons born during their lifetime It would seem that, in the days of ancient warfare, the Knight often took his eldest son into the wars for the purpose of giving him a practical military education, employing him mean time as his esquire. 3. The eldest sons of youngest sons of Peers of the realm. 4 Such as the King invests with the collar of SS including the King at arms, heralds, &c The dignity of Esquire was conferred by Henry IV, and his successor, by the investure of the collar and the gift of a pair of silver spurs. Gower, the poet, was such an esquire by creation 5. Esquire to the knights of the Bath for life, and their eldest sons 6 Sheriffs of counties for life, coroners and justices of the peace, and gentlemen of the royal household while they continue in their respective offices. 7 Barristers at law and some others, are said to be of scultarial dignity, but not actual esquires.

SCIENTIFIC FACTS.

ILLUSTRATIONS OF EXTREME MINUTENESS.—Dr Wollaston ained platinum wire so fine, that thirty thousand pieces, placed e by side in contact, would not cover more than an inch. It uld take one hundred and fifty pieces of this wire bound toge- r to form a thread as thick as a filament of raw silk Although tinum is the heaviest of the known bodies, a mile of this wire uld not weigh more than a grain Seven ounces of this wire uld extend from London to New York The natural filaments wool, silk, and fur, afford striking examples of the minute sibility of organised matter. The following numbers show how ny filaments of each of the annexed substances placed in con- t, side by side, would be necessary to cover an inch —

Coarse wool	500
Fine Merino wool	1,250
Silk	2,500

ne hairs of the finest furs, such as beaver and ermine, hold a ace between the filaments of merino and silk, and the wools in neral have a fineness between merino and coarse wool Fine as the filament produced by the silk worm, that produced by the ider is still more attenuated A thread of a spider's web, uring four miles, will weigh little more than a single grain ery one is famil

d by which his own weight hangs suspended. It has been certained that this thread is composed of about six thousand

A soap-bubble as it floats in the light of the sun flects to the eye an endless variety of th lour Newton showed that to each of these tints corresponds certain thickness of the substance forming the bubble; in fact, showed in general, that all transparent substances, when duced to a certain degree of tenuity, would reflect these colours ar the highest point of the bubble, just before it bursts, as ways observed a spot which reflects no colour and appears black ewton showed that the thickness of the bubble at this point e 2,500,000th part of an inch! Now, as the bubble at this point ossesses the properties of water as essentially as does the Atlantic ean, it follows that the ultimate molecules forming water must ve less dimensions than this thickness The wings of insects, ich reflect beautiful tints resembling mother-of-pearl, owe that ality to their extreme tenuity Some of them are so thin that 0,000 placed one upon the other would not form a heap of more an a quarter of an inch in height! In the manufacture of broidery, fine threads of silver gilt are used. To produce these, bar of silver, weighing 180 oz. is gilt with an ounce of gold, is bar is then wire drawn, until it is reduced to a thread so fine at 3,400 feet of it weighs less than an ounce It is then flat ned by being submitted to severe pressure between rollers, in hich process its length is increased to 4,000 feet Each foot of e flattened wire weighs, therefore, the 4,000th part of an ounce ut, as in the process of wire-drawing the proportion the two metals is maintained, the gold will cover the surface the fine thread thus produced, consists only of the 180th par whole weight. Therefore, the gold which covers one foo only the 720,000th part of an ounce, and, consequently, the go hich covers an inch will be the 8,640,000th part of an ounce If ns inch be again divided into one hundred equal parts, each part ill be distinctly visible without the aid of a microscope, and yet, e gold which covers such visible part will be only the 864,000,000th art of an ounce But we need not stop even here This portion f the wire may be magnified 500 times, and by these means, erefore, its 500th part will become visible

EXISTENCE OF ANIMALS IN LOW TEMPERATURES.—Many nimals have, however, the power of bearing the greatest differ- nce of temperature, and many infusoria live in [illegible] ccording to Shuttleworth and Vogt, there are five organisms ndowed with this property, of which four belong to the infusoria, nd one to the crustacea, and these organisms give a red colour to he snow. A multitude of infusoria are found beneath the ice in winter, of which Schmarda enumerates fifty species as found by imself Doyère dried wheel animalculum, and having dumped hem, and put them for a few minutes into a temperature of from 20 deg to 140 deg of Reaumur, several recovered, but the experi- ent establishes no proofs, as it is entirely isolated and without nalogy. Insects are to be found in the greatest extremes Reaumur and Degeer found the larvæ of gnats in ice. Captain Buchan [illegible] frozen lake which in the evening was all still and hard, but s soon as the sun had dissolved the surface in the morning, [illegible] n a state of animation, owing, as it appeared on close inspection, o myriads of flies let loose, while many still remained fixed and rozen round. Ellis also mentions that a large black mass like oal or peat, dissolved, when thrown upon the fire, into a cloud of musquitoes. Humboldt found beetles far above the line of per- etual snow of the Cordilleras. Several springtails (*podura hie- malis* and *glacialis*) live on the snow, and impart to it a black or red colour On the other hand, Dr. Reeve found larvæ, supposed to be those of the crane fly (*tipula*), in a hot spring, at 205 deg. of Fahrenheit, and Perty discovered caddis larvæ (*phryganea*), in a spring in Wales, at 150 deg of temperature. Among fish, the bream, if packed in snow, can be preserved alive for a considerable time; and carp, after having been frozen so hard as to require the force of an axe to divide them, have recovered on being thawed.—*Thompson's Passions of Animals*

FORCE OF THE ELECTRIC FLUID.—The following curious and dangerous effects of lightning may not be familiar to many who witness its grand and awful exhibitions.—A person may be killed by lightning, although the explosion takes place at twenty miles, by what is called the back-stroke. Suppose that the two extremities of a cloud highly charged with electricity, hang down towards the earth, they will repel the electricity from the earth's surface, if it be of the same kind with their own, and will attract the other kind and if a discharge should suddenly take place at one end of the cloud, the equilibrium will instantly be restored by a flash at the point of the earth which is under the other. Though the back-stroke is often sufficiently powerful to destroy life, it is never so terrible as the direct shot, which is frequently of inconceivable intensity Instances have occurred in which large masses of iron and stone, and even many feet of stone wall, have been conveyed [illegible] by a stroke of lightning Rocks and the tops of mountains often bear the marks of fusion from its action, and occasionally vitreous tubes, descending many feet into the banks of sand, mark the path of the electric fluid Some years Dr Felder exhibited several of these fulgurites in London of considerable length, which had been dug out of the sandy plains of Silesia and Eastern Prussia One found at Paderborn was forty feet long The ramifications generally terminate in pools or springs of water below the sand, which are supposed to determine the course of the electric fluid No doubt the soil and substrata must influence its direction, since it is found by experience that places which have been struck by lightning are often struck again. A schoolhouse in Lammermoor, in East Lothian, has been struck three different times

THE STEREOSCOPE.—The phenomena of vision have engaged the attention of our most acute philosophers, and various have been the theories propounded to explain the result of single vision with pair of eyes, which are of necessity under the influence of two impressions The researches of Wheatstone have done more than those of any other man to place this phenomenon in a clear light. In his stereoscope we survey two images viewed at the angle of reflection converted into a *solid* body—that is, a body conveying to the mind an impression of *length breadth*, and *thickness* This instrument has recently been modified by Sir David Brewster, who, by cutting a lens into halves [illegible] places each half so as to represent an eye—the distance between the meeting 2½ inches—has very beautifully imitated the [illegible] of the eye Such an instrument is used as a camera for photographic purposes, and daguerreotypes obtained in it, as we have seen them with great delicacy by Mr Claudet, are examined under [illegible] ope. The result [illegible] reality of the most deceptive character.

A FLASH OF LIGHTNING.—Dr Lardner, in his "Handbook of Natural Philosophy," says—"A flash of lightning appears to the eye as a continuous line of light, because the light emitted at any point of the line remains upon the [illegible] the cause of the light passes over the succeeding points In the same manner, any [illegible] moved before the eye with such a velocity that the retina [illegible] impression produced at one point in the line of its motion until it passes through the other points, will appear as a continuous line of light or colour.

ASTRONOMICAL FACT.—A curious fact for astronomers has just been ascertained In the papers of the celebrated Lalande, recently presented to the Academy of Sciences by M. Arago, there is a note to the effect that so far back as the 25th October, 1800, he and Bouvard were of opinion, from calculations, that there must be a planet beyond Uranus, and they occupied themselves for some time in trying to discover its precise position.

WATER GAS.—The following is the process used in the manufacture of water gas.—A rapid succession of drops, or a small stream of water is allowed to fall upon a body of incandescent charcoal A very large volume of pure water gas is thus rapidly produced, which being made to combine with gas from cannel in its nascent state, is found to double and even treble the usual amount got from a given weight of coal, and of such purity that no smoke can be drawn from it.

VEGETATION AT THE NORTH POLE.—In the never ending winter, where you would expect life to become extinct, the snow is sometimes found of a bright red colour Examine it with a microscope, and lo! it is covered with mushrooms growing on the surface of the snow, as their natural abode.

MISCELLANEA.

TRUTH considered in itself, and in the effects natural to it, may be conceived as a gentle spring or water-source, warm from the genial earth, and breathing up into the snowdrift that is piled over and around its outlet. It turns the obstacle into its own form and character, and as it makes its way increases its stream. And should it be arrested in its course by a chilling season, it suffers delay, not loss, and waits only for a change in the wind to awaken and again roll onwards

SLEEP AT WILL.—"Sometime since I observed advertisements in the London papers, offering to communicate, on payment of a sovereign, a mode of producing 'sleep at will.' Can you tell me how this can be done?—INVALID."—The following directions for procuring rest are from Dr Burn's work on "The Anatomy of Sleep."—"Let the person turn on his left side, place his head comfortably on the pillow, so that it exactly occupies the angle a line drawn from the head to the shoulder would form; and then, slightly closing his lips, let him take rather a full respiration, breathing as much as possible through his nostrils. This, however, is not absolutely necessary, as some persons breathe always through their nostrils during sleep, and rest as soundly as those who do not. Having taken a full inspiration, the lungs are then to be left to their own action—that is, the respiration is neither to be accelerated nor retarded. The attention must now be fixed on the action in which the patient is engaged. He must depict to himself that he sees the breath passing from his nostrils in a continuous stream; and the very instant he brings his mind to conceive this, apart from all other ideas, consciousness and memory depart, imagination slumbers, fancy becomes dormant, thought subdued, the sentient faculties lose their susceptibility, the vital or ganglionic system assumes the sovereignty, and, as we before remarked, he no longer wakes, but sleeps. This train of phenomena is but the effect of a moment. The instant the mind is brought to the contemplation of a single sensation, that instant the sensorium abdicates the throne, and the hypnotic faculty steeps it in oblivion."—We would advise "Invalid" to try this method, as it can be done at little cost, although we must confess that we have no great confidence in it. We much fear that if a person thus learn to sleep by breathing through his nostrils, he will inevitably, at the same time learn to *snore* loud enough to wake himself

HOW IS IT THAT CANDLES WITH TWISTED OR PLAITED WICKS DO NOT REQUIRE SNUFFING?—The burning wick, by the force of torsion of the fibre which composes it, presents itself to the air, and, finding a due supply of oxygen, the carbon burns away. The little beads of vitreous matter, which are seen to accumulate at the end of the wick, are so many beads of glass. Formerly, the dropping of ashes into the tallow or stearine of the candle was productive of much inconvenience, when it was suggested that the wicks, previously to being covered with their greasy coating, should be steeped in a solution of borax. The plan was found to succeed perfectly; the ashes, fusing with the borax, formed a glass, which no longer soiled the stearine by dropping upon it.

ANSWERS TO CORRESPONDENTS.

X. Y. Z will find the information he requires on the method of making a galvanic machine, in Knight's "Cyclopædia of Industry," and also in a little volume published by Cradock, Paternoster-row.

D—r wishes to know what is the necessary outfit for a married couple proceeding to America, and where he could best obtain a daguerreotype portrait of his parent, whom he leaves behind. With regard to the first question,—so much depends on his own means that we should scarcely like to advise; as to the last, he may get a photographic well and cheaply taken at 374, Strand.

W. SNELLING and others, who have written for further instructions in photography, are informed that an article will shortly appear in the ILLUSTRATED EXHIBITOR, in which more minute instructions will be given. Cheap apparatus may be obtained of Messrs Horne and Wood, Newgate, Mr. Ross, Featherstone-buildings, Holborn, and Messrs Field, Birmingham.

IGNORANCE should read his classics, and he would soon discover the meaning of the Hungrian lady who told George, that she saw Diogenes peeping out of his torn coat.

R. W. P. wishes to know what history of France comes nearest in style to Macaulay's History of England? With all modesty, we beg to refer him to the History of France, which is publishing in John Cassell's Library.

QUARTUS wishes to know if there is any truth in astrology. Speaking of astrology as the term is at present understood, it is false and fabulous, but considered in reference to its results—the discoveries and speculations of astronomers—it may be considered to have had great influence in eliciting truth. The dreams engendered in the minds of half educated men have evolved many important truths which these men have seized and practised.

A. B.—The tartar or incrustation on the teeth may be removed by means of powdered pumice stone and charcoal applied in the usual way with a tooth brush. Nothing can be better to keep the teeth clean than to keep them so.

WILLIAM BENNETT.—Water converted into steam occupies more than 1700 times its own bulk of space. Steam will be produced at a proportionately lower temperature if we diminish the pressure of the atmosphere on the water, which may be done either by ascending a mountain or by withdrawing a portion of the air by means of an air pump. When we continue to heat ordinary steam, its elasticity rapidly increases, and it is then termed *high pressure*, while steam of the ordinary temperature is called *low pressure*. We are not aware of any law which prevents a person from using a still for chemical purposes.

JAMES BUNTING and others have applied to us for a specific against early baldness. Vegetable oils and fruits are the only means for increasing the growth of the hair.

W. D. S.—The "True-born Englishman" of Daniel De Foe, is not now included in the list of published books called the London Catalogue. It can only be seen in a public library, the British Museum for instance.

A FARMER will find in the *Companion of Industry*, and in a hand-book on Farming, published by Longman and Co. all he requires. It is not unlikely that we may refer more particularly to the subject of agriculture in the *Friend*.

H. C. W. is informed that his [illegible] is even now undergoing the examination which the Editor promised him, and which, should be made.

CHRISTOPHE appears to be ignorant of the existence of our "French Lessons" and "Manual of the French Language," or he would not ask us what is the best method of obtaining a knowledge of French without the aid of a teacher. Both works may be obtained. Order of any bookseller.

A SUBSCRIBER at Castle Mill is duped. The last number of the *Friend* for a few [illegible] in favour of teetotalism. It would be [illegible] say which is the *best* History of England, but he will find Dr Ferguson's, in "John Cassell's Library," very good indeed.

A TEETOTALER will find himself answered elsewhere. The third volume of the *History of Ireland* is now ready for delivery.

W. W. will find his [illegible] reply to PERRY, in No.

IMEINS.—There is a cheap edition of Milton's complete works published by Daly, Hatton-garden.

JOHN DODMAN.—The working drawings of a camera obscura would cost more than a complete apparatus. Apply to any mathematical and philosophical instrument maker.

R. G. C.—The seven wonders of the world were, the Colossus at Rhodes, the Sepulchre of Mausolus, King of Caria; the Palace of Cyrus, King of the Medes; the Pyramids of Egypt; the Statue of Jupiter Olympus, the Temple of Diana at Ephysus; the Walls of Babylon. These were the classic seven wonders; what the modern wonders are it would be rather difficult to say.

A SCRIBBLER asks how he may improve his written compositions? The art of composing sentences clearly, so as to express his own meaning and interest those who read, is well worthy the attention of every young person; it cannot be attained without close application to study, but its value and beauty will be an ample recompense. Two or three general rules may be given. *First*, due regard should be paid to the *length* of your sentences, if they be too *short*, the sense is apt to be broken, if they be too *long*, the attention of the reader may be fatigued. A mixture of long and short sentences is generally most pleasing. *Secondly*, your meaning should be expressed with *clearness*. Right words must be selected and properly arranged, and your leading idea must be kept fully in view. And, *thirdly*, this should be expressed with *force*. The sense should be brought out to the greatest advantage, that every word may have its due weight, and make a suitable impression on the mind of the reader. Practice will enable you to arrange your words and sentences in the most *pleasing* form.

"BACHELOR" surely cannot be serious in asking us to direct him as to his choice of a suitable companion for life. How can we do this who are utter strangers to his character, tastes, habits, or expectations?

W. BANCROFT.—It is quite impossible for us to say "whether Napoleon has an idea of placing on his head the imperial crown," or whether he is planning an invasion of this country." Time will show.

JAMES PENROSE.—The minie rifle is not yet sold in England; but rifles made on the same principle may be obtained of the best London gunmakers.

A WELL WISHER'S first question, respecting a passage in Dr. Ferguson's History of England, shall be answered next week. The spots which appear on kid gloves arise from the imperfect dressing of the leather, or from damp. There is no way of removing them that we are aware of.

L'HOMME FRANÇOIS.—The literary trade of France is carried on principally in Paris, Lyons, and Croves, but where a directory of the manufacturers can be obtained we are not aware. Apply to Messrs Gnetzen and Hermann, of Huggin-lane Cheapside, the agents of the principal French manufacturers. We reply to our correspondent's [illegible] in the order in which he asks them. He should read the Manual of the French Language, and he will find all he requires. Its price is 2s. 2. *Tong*, but not so nasal as this would sound in English, something between *tong* and *ton*. 3 *Heureux*, is pronounced *kurw*, giving the *u* the peculiar French sound, as explained in the French [illegible]. 4 *Aujourd'hui* is pronounced *zhoord-hwe*. 5. *Habit* is *habee*. The *h* is but slightly heard, and the accent on the last syllable. 6 *Manang*, but shorter, something between *mang* and *maung*. 7. Brah. 8. As the English [illegible]. Lastly *pauvre* sounds pove, the [illegible] being very slightly sounded, and the [illegible] number of the History of France [illegible] include the present series of John Cassell's Library.

C. B.—SLEEPING AFTER DINNER.—Dr Combe, a high authority on all matters of hygiene, says—Sleeping after dinner is a bad practice. On awakening from such indulgence there is, generally, some degree of febrile excitement, in consequence of the latter stages of digestion being hurried on, it is only useful in old people, and in some cases of disease. Sleep becomes wholesome only to the healthy when taken at those hours pointed out by nature; an excess of it produces lassitude and corpulency, and utterly debases and stupifies the mind. Corpulent people should sleep little, and upon hard beds, while they should take abundance of exercise and live abstemiously, that their unhealthy bulk may be reduced.

THE ISLAND OF JERSEY.

...r to a traveller approaching from England, Jersey presents an uninviting aspect as he sees the bare rocks that fringe the shore, it is because he is advancing towards it at *low* water. It is the contrary when he reaches it at *high* water, for the rise and fall of the tide along the southern shore of the island is upwards of forty-five feet. No one at such a time can sail round Noirmont Point and pass across the mouth of St. Aubin's Bay, towards the harbour of St. Helier's, without the most lively admiration of the scene. The noble brim-full bay, stretching a fine curve of many miles, its sloping shores charmingly diversified with wood and cultivated fields, and thickly dotted with villas and cottages, open before the eye; on the left, close to the vessel as she sails by, is the gay and imposing fortress called Elizabeth Castle, having for its base a huge sea-girt rock, while in front

MOUNT ORGUEIL CASTLE.

s the town of St. Helier's, commanded by its lofty old, and backed by a fine range of wooded and cultivated heights.

Jersey, with the other Channel islands, are within sight of the French shores. As part of the duchy of Normandy, they became connected with England when the Duke of Normandy obtained possession of the English crown. They were held independently of this country when the conquerer's son Robert reigned as Duke of Normandy, but were again united to England when Henry I. obtained possession of the duchy. They suffered in the reign of Edward III. when, for some years, they were partially possessed by the French. Other troubles were experienced during the struggle between the houses of York and Lancaster, as well as in the civil wars. In an address presented to William and Mary, the inhabitants of Jersey expressed a hope that their majesties would believe that, though their "tongues were French their hearts and swords were truly English." Yet it is only of late that the people had any considerable and particular acquaintance with ours.

Jersey, in form an irregular parallelogram, is about ten miles long and five broad. Its greatest length from south east to north-west is about twelve miles. Its circumference, taking in all the sinuosities and windings, is nearly fifty miles. Its superficies contains about 40,000 acres. The surface of the island slopes from north to south; the whole of the northern coast, with the eastern and western shoulders, being composed of lofty, precipitous cliffs, while the southern shore, though fringed with crags and beds of rock, lies low, and has a considerable portion of sandy beach. Bays, caves, and inlets indent the whole circumference of the island.

According to Dr. Hooper, Jersey enjoys an early spring and a lengthened autumn, vegetation being usually active and forward in March, and the landscape far from naked at the end of December. Spring is marked, however, by unsteadiness of temperature, and harsh variable weather, with a prevalence of east winds; and this disadvantage is felt particularly in May, which often fails to bring with it the expected enjoyments. Yet March is mild, and October still milder.

A sight of the scene presented by one of the eminences, Mr. Inglis says, "immediately begets a desire to range over the island, to penetrate into the valleys and ravines, ... der through the fields, pastures, orchards, and gardens, and to descend to the bays and creeks, which one pictures full of quiet and beauty; and for my own part, I was not long in yielding to the desire.

(Continued on page

THE WORKING MEN OF ENGLAND, AND AN ORGANISED MILITIA.

It is now becoming every day more evident that the chief danger of the world is from standing armies. We have again and again been told that soldiers and sailors are the bulwarks of nations; but in the same breath we are called upon to arm; and for what purpose? Not against the women or children of France and other countries. Not against the kings, the emperors, the presidents, the mechanics, the tradesmen, the merchants, scholars, and philanthopists of the various kingdoms. These excite no alarm. Were the world inhabited by none but these, we might immediately, all of us, join "The Peace Society," and "beat our swords into ploughshares, and our spears into pruning-hooks." But the terror of the world is its armies. If France had no armies, England would have no panic; and if England had no armies, then every Frenchman might sleep in peace; so that the nations are actually spending millions a year to frighten one another. Wherever we look, there is nothing to create alarm but the troops. There is nothing in Russia, Austria, or Prussia to disturb other countries but the armed men, so that the boasted security of the world is its sole insecurity.

It seems also that no amount of armed force can at present free the nations from the dread they have of each other. But for the want of money, there would be no end of soldiers, because each would be vieing with the other in the multiplication of these slaughtermen. It has as yet scarcely occurred to princes and rulers that to diminish the number of their troops would answer the purpose as well as to increase them, because if twenty thousand are equal to twenty thousand, then ten thousand are equal to ten thousand, five to five, one to one, and none to none. There was a time when England had no standing army, when all her enemies were semi-barbarians, and nearly all neighbouring nations were her enemies, and yet she was not then so much alarmed as now. At present we are said to have among us the greatest commander in the world, the bravest officers and troops under heaven, ships of war and marines that surpass those of all other countries, and we annually spend, on the preparation for aggressions, from sixteen to twenty millions a year, and yet we are told, the French are told, and all the world is told, that England is now almost entirely in a defenceless state.

It is well known that the effort to produce a panic comes from the army and navy, or persons who have a monetary interest in the increase of our troops, and therefore we have always wondered that these gentlemen have not had a little more modesty and self-respect. For the government to tell us that we are defenceless, is not only to invite the French to attack us, but also to inform us that our chancellors of the exchequer and others have most notoriously wasted our revenues. For they have taken millions a year out of our pockets and spent them upon soldiers, sailors, ships, ammunition, forts, &c. &c., and now they assure us that all has been so badly laid out that we are defenceless, and may have Louis-Napoleon in London before the end of March! Never has there been so bare-faced an example of an unfaithful steward proclaiming his own wickedness and inefficiency, and appealing to his master to countenance his delinquencies. For our generals, admirals, soldiers, sailors, &c., to set up this cry, is to proclaim their own inadequacy, indolence, and cowardice. We have thousands upon thousands of tall muscular men, all of a certain height, every one of whom has been stripped and examined by medical physiologists, who have measured him, weighed him, inquired into his history, felt him all over, made him cough, sounded his chest, and sent him to drill that his physical energies may be perfected, and now we are told that notwithstanding all these thousands of strong men armed "*cap a pie*," we are every moment in danger of seeing the French in London. We have often heard our soldiers in former years sing most courageously the old chorus—

> "For there is no rebel Frenchman, sans culottes,
>
> Shall conquer the English, the Irish, or Scots,
> 'Or land upon our coasts'

But so thoroughly are our military men debased in these days that they are the first to create a panic; and were they to have a chorus made for their sweet voices in our times, it would be—

> "For ANY rebel Frenchman, sans culottes,
> * * * *
> MAY conquer the English, the Irish, the Scots,
> *And land upon our coasts*"

And the only remedy for this vaunted inadequacy, inefficiency, and cowardice, is to call out a host of irregular militia. We use no exaggerated language when we say that in former years our countrymen would sooner have cut out their tongues with their own knives or swords than have proclaimed to France and all the world that Great Britain, with all its valiant generals, admirals, and thousands upon thousands of hardy common soldiers, was in danger every minute of being invaded by the French! What a proof of the degradation to which the love of place and money will sink a people.

While all persons are interested to put down this war-cry, "THE WORKING MEN" above all others ought to exert themselves against it; because the calling out of the militia will inflict a greater injury on them than on any other class of her majesty's subjects: for, of course, they will especially be called upon to serve in very large numbers. Constituting, as they do, the largest portion of the community, the greatest number would be drawn from their ranks, so that while the hardship and injustice will press heavily upon many of the middle classes, the operative and labourer will be the greatest sufferers, and thus self-defence, which is said by some to be the first law of nature, should induce them to protest against this attempt to burden them with an additional political injury. We have often shown that our present system of taxation and several other instances of national injustice are particularly oppressive to the sons and daughters of labour, and this militia act will be more so than any. In fact there is no view we can take of the subject but shows its extreme impolicy and wickedness.

We are doing all we can to induce the French to attack us. We are telling them in so many words that we have no faith in them. That we believe that they have neither honour, honesty, nor humanity, and that we are obliged to watch them as we would a band of savages. We need not say that it is very provoking to our neighbours to hear continually that we are thus suspicious of their integrity, and must be more calculated than any thing else we could do to induce them to assail us. Or if they should abstain from invading us, yet our conduct must excite in them every sort of bad feeling; and as a consequence, our friendly intercourse and trade and commerce with them will suffer, and therefore the employment of the people will be injured. We feel persuaded that the Liberal party change in the government of France is not the work of the great mass of the French nation. The ambitious president, the military, and the priesthood, have been the principal actors. There is still a large body of citizens who know something of the sweets of trade with England, and that it is more profitable to buy and sell than to fight. And we believe that though public opinion is suppressed, yet there is a deep mass of patriotism remaining, and it is of the utmost importance that the trading and peaceable portion of our own community should keep on good terms with the merchants, tradesmen, and operatives of France, and therefore we should do all we can to put down the cry for arms. Our country is now beginning to reap some of the advantages of free trade. Bread is cheap, employment is increased, wages are higher, poor rates are decreasing, and crime diminishing, and all these advantages may be traced to the abolition of our corn-laws and other imposts, which fettered the industry of the country and limited our commerce with foreigners; and nothing but the greatest madness could induce us to raise suspicions which would in any way injure our trade with France or any other nation.

We are afraid that in this war-cry there is more craft than at first appears. The most corrupt designs have often been concealed under the name of patriotism. We have among us some thousands who prophesied that free trade would be the ruin of the country, and who now feel that their credit is at stake if their predictions are not verified. All these friends of protection long for dear bread and restricted trade, and know full well that a war would work wonders in accomplish-

ng their wishes. Not a few of these persons long to let loose the dogs of war; and would hail a rupture with England and France. For the strife once commenced, no one can say where it would end. And what so likely to bring on the collision as to increase our armaments and call out the militia. In our boyish days we attended many country fairs and wakes, and these generally were celebrated by several pitched battles, which were generally brought on by two or three bullies walking about in a pugnacious attitude, and shaking their fists in the faces of other people. Now, what is this call for arms and demand for a militia, but England shaking her fist in the faces of the French to provoke them to assail us? especially when we tell them with the same breath that our regular troops are no longer fit to compete with them, and our country is so defenceless that Louis Napoleon may any morning he likes put on his head the crown of Queen Victoria, for nearly all the papers assure us that we are lying at the entire mercy of the French president. To every working man and woman we would say, "If you value full employment, good wages, cheap bread, and diminished taxation, then resolve not to be led astray by the cry of 'wolf,' and demand for

II. The means to be adopted are a gross infraction of the liberties of free citizens. We well remember when a young man could not walk the street for fear of the barbarous *pressgang;* but what is drawing for the militia but the exercise of the very same iniquitous power? Every person drawn will be compelled to serve, or be sent to prison. Hence, no young man of good health, proper age, and firm muscle, will be safe. Liberty is, therefore, at an end, if the Militia Act should become the law of the land From that day Englishmen are slaves. The principle, therefore, is one which ought to be opposed. To tear a man from his home, his wife, his children, his occupation, his trade, for a certain portion of the year, and doom him to all the demoralisation of a soldier's life, partakes so much of the despotism of continental tyranny, that first that the working classes and other ranks of the community will rise, and with one voice denounce it as a flagrant violation of the rights of British subjects.

We have more to say on this subject, but must defer our remarks till next week.

THE FUNERAL OF A MOTH

A CHILD'S VISION.

A LITTLE child has been amusing itself at the feet of its mother, kicking and rolling about, and playing all sorts of antics, when it espied a moth disengage itself from the fibre of the carpet, and poise its small wing with a short, wavering flight. The child stopped its noisy song, rolled over upon all fours, and commenced a scramble for the poor insect, slapping its clumsy hand upon the carpet in the hope of striking it down. It did so at last—the moth fell upon its side, quivered slightly, and was still.

The child would have taken it in his hand, but suddenly there was a sound as of innumerable tiny bells tolling, and very low, sad music. He laid his cheek upon his arm, the bright curls falling all about the carpet, and his little feet stretched out, and crossed one over the other, the disarranged tunic revealing liberally his round white limbs, indolently exposed. Thus the child lay, listening to the music, that seemed to say—

"Alas, for death is amongst us"

It could not tell what was meant, [illegible] moth stirred not, and it felt something very sad must have happened. At length a large black beetle was seen to move slowly along, and look at the little insect, and then, while the eyes of the child were fixed intently to see what would become of it, the beetle seemed a little old woman, much wrinkled, and dressed in black. She moved about quite briskly, and the child could scarce forbear a smile to see such an alert, diminutive thing. His mother's little gold thimble had fallen from her basket, and now stood upon the carpet beside the dead moth, and the child observed that the little woman in black was not as tall as the thimble. She took a robe, made of the fibres of a rose-leaf, from her pocket, and shrouded the moth, singing all the time,

"Alas, for the gladsome wing
Shall never more be spread—
When cheerful you[illegible]ring,
That may not wake the dead."

Then a grasshopper came in with a slow, sepulchral tread, bearing upon his thigh the several pericarp of the balsam (impatiens), lined with gossamer, and having tassals hanging from the pall. He had no sooner approached the dead moth, than he appeared a grave and venerable undertaker, bearing the coffin, into which he and the little old woman put the poor insect, and covered it with the pall of gossamer, singing all the time in a sweet, sad voice.

Then an immense procession of moths (they were of that kind called death's-head, undoubtedly a class designed to officiate exclusively at funerals), followed the undertaker as he bore out the body—but as they moved on, they were all little men and women, dressed in drab, each with a sad, pale face, and now and then one of the younger with a handkerchief pressed to the eyes; while all sang in chorus the following words—

"Rest thee, rest thee, blighted one,
Sunshine may not come to thee,
When our joyous wings are spread,
Thine in death shall folded be
Rest thee, sad and early call'd,
From our pleasant haunts away,
Where we met in sunset revels
At the close of summer day"

The child heard the hum of their voices when he had ceased to distinguish the words. Then he arose, and laying his head upon his mother's lap, wept bitterly, telling her what he had heard and seen, and asking what death meant. She talked long upon the sad but pleasant subject, telling of that land where death is not, till the heart of the little boy grew joyous within him, and he called that land his home Had the child been less young or less innocent, the visions of the moth's funeral had not been vouchsafed But he never, from that time, wantonly destroyed the humblest creature made by the wisdom, the goodness, and love of our heavenly Father. He saw there was room enough in the great world, and in the pleasant sunshine for him and them, and he remembered that a better mind had been promised to man only; therefore he would not abridge the few days of happiness granted to the little insect The child daily grew gentle and loving, for the exercise of kindness even in one simple instance, had fixed the principle in his young heart, till it expanded so that it embraced all the creatures made by our great and good Parent It was thus that he learned, not only to love worthily the good and loving, but even those in whom the image of God, stamped upon the human soul, had become marred and effaced by sin He loved and prayed even for these, and the blessedness of such prayers returned upon his own head Thus did the child learn a lesson of wisdom, and of goodness, from the Funeral of the Moth.

LOVE OF FRIENDSHIP.—Women are generally more devoted to their friends than men, and display an indefatigable activity in serving them Whoever has gained the affections of [illegible] by enterprise wherein she assists him, men draw back much sooner in such cases Frequently in my life have I had occasion to admire in females the most generous zeal in behalf of their friends Who is not astonished at the courage by a woman, when her husband, whose misconduct has perhaps a thousand times offended her, is threatened with imminent danger? Who does not know many instances of the most heroic devotedness on the part of the sex? A woman spares no effort to serve her friends When it is a question of saving her brother, her husband, her father, she penetrates into prisons—she throws herself at the feet of her sovereign. Such are the women of our day, and such has history represented those of antiquity

SORROW.—Sorrow is the night of the mind What would be a day without its night? The day reveals one sun only; the night brings to light the whole of the universe The analogy is complete. Sorrow is the firmament of thought and the school of intellig[illegible]

(Continued from page 385.)

'Every place has its lions, every district in every travelled country under the sun has its accustomed drives; and the traveller who visits Jersey for a few days, for the purpose of seeing the island, will be placed in a jaunting car, and carried across the island, or taken the great round and the little round, and be told he has seen Jersey. But there are many valleys up which the jaunting car never travels, many deep dells where there are no roads for cars, many a tiny rivulet that waters into fertility green meadows dotted with cattle that seldom raise their heads to look at the stranger, many little roads, inlets, and creeks, to which there is no trodden path; and therefore the traveller who seats himself in the vehicle gains but a very imperfect knowledge of the outward aspect and natural beauties of Jersey." No doubt the pedestrian has peculiar advantages in traversing any part of the earth; but assuredly it is better to have a hasty glance of this island than none at all, while a few days will give a stranger a sufficient knowledge of it for all ordinary purposes.

A large portion of the cultivable land is occupied by apple trees, and of this fruit and cyder there is a considerable export. The pride of the island is the Chaumontelle pear, which is said to be often a pound in weight. Other fruits are also produced; peach-apricots, melons, and strawberries are abundant, and they are noted for their size and flavour. Timber trees, growing in the hedge-rows, unite with the fruit trees in giving to the scenery a peculiar softness and richness. Jersey, indeed, appears like an extensive pleasure-ground,—one immense park, thickly studded with trees, beautifully undulating, and dotted with cottages.

The Jersey, usually called in England the "Alderney cow," has a fine curved tapering horn, slender nose, fine skin, and deer-like form. It materially differs from that of Guernsey, which is larger, and resembles the short-horned Devonshire breed.

It has been mentioned as one advantage of a visitor to Jersey, and which the traveller to various parts of the continent will not fail to appreciate, that he may, if he please, take his carpet-bag in his hand, without asking leave of a custom-house officer, and have the satisfaction of seeing his trunks carried before him to the hotel, without the tedious delays incident to revenue regulations.

St. Helier's, the capital of the island, stands on the east side of St. Aubin's Bay, on a slope facing the shore between two rocky heights, on one of which is the citadel, Fort Regent, overlooking the harbour, as may be seen in the engraving. It was erected in 1806, at the cost of £800,000, and possesses all the usual defences of a regular fortress; yet strange to say, it has little accommodation for troops. In the old and central parts of the town, the streets are narrow and irregular; but in the out-skirts they are regular, well-built, and ornamented with garden-grounds in front. The chief open space within the town is the Royal-square. The market-place is inclosed by a wall with iron palisades, and on Saturdays there is a very rich display of vegetables, fruit, and flowers, besides poultry and game from France, all at very moderate charges.

In the centre of the bay, within about three-quarters of a mile from the pier of St. Helier, is a large rock not less than a mile in circumference, the surface of which is covered with the buildings and fortifications of Elizabeth Castle. Its name is derived from the sovereign in whose reign it was partly built; but the parts below the iron gates were afterwards added, and many additions were made to the castle in the time of Charles I. There is a tradition that, in order to defray the original expense of this erection, all the bells of the churches and chapels of Jersey were seized and shipped for St. Malo to be sold, but that the vessel which carried them foundered in a storm, to the satisfaction of those who regarded the seizure as an act of sacrilege. Another statement is that an order in council directed that one bell should be left in every church, the remainder sold, and the money applied to the building of the castle. "I was surprised," says Mr. Inglis, "on passing through the gateway, to find a wide grassy level, terminated by extensive barracks and their appurtenances. In war time this fortress was an important place, and, no doubt, presented to the eye and ears of the traveller a very different scene from that which it now presents. Decay seems now to be creeping over it; and, although a solitary sentinel is still to be seen pacing to and fro, and although pyramids of shot still occupy their accustomed places, grass and weeds have forced their way through the interstices, and the rows of dismounted cannon show the stirring days of war have gone by. May the weeds long grow, and the rust continue to creep over the engines of death!" is a wish of this interesting traveller that we may breathe in reference to them, wherever they are found on the face of the earth.

Quitting St. Helier's, and passing St. Saviour's, the visitor may proceed to Mount Orgueil Castle, of which we give an engraving, and its neighbour, the little town or village of Gorey, the seat of the Jersey oyster fishery. Mount Orgueil Castle is the most ancient fortification in the island. It stands on a rocky headland, whose lofty appearance gave rise to its name, which juts out into the sea, separating the Bay of Grouville from that of St. Catherine, which occupies the greater part of the eastern side of Jersey. No one knows how long it existed prior to the reign of John; but at that time it was enlarged and strengthened. It is now entitled, whether seen from land or sea, to be called an imposing ruin. In many parts the walls are yet entire; but in other places, massive as they are, they have yielded to the pressure of time; and the mantle of ivy which in most parts hangs from their very summits, is in fine unison with the grey tint of age which is seen here and there above the walls, which are bare, and with the loop holes and rents of passing years. A magnificent prospect is enjoyed from the summit, embracing several of the bays which lie on either side the richly-wooded range of heights that girds the central parts of the island, and the village of Gorey, far below, with its harbour and shipping, the whole expanse of sea, and the distant coast of France.

In this castle the celebrated William Prynne was for some time imprisoned, one of the many victims of intolerance in the reigns of the Stuarts; and here, too, one of that family lived during some of the days of his wandering, before he rose to the throne of England as Charles II. It is also worthy of remembrance that in Elizabeth Castle Lord Clarendon resided for two years, while engaged in writing his history of "The Rebellion."

ELIZABETH CASTLE.

LECTURES TO WORKING MEN.

ON THE MODE OF OCCURRENCE OF METALS IN NATURE.

On Monday evening, March 8, Professor Warrington Smyth delivered a lecture at the Museum of Practical Geology on the above subject.

The lecturer commenced by stating that the subject was one which required far more time than one hour to do it justice He should, therefore, chiefly confine his attention to some observations illustrative of the mode of arrangement of metals in the Museum, with some remarks on the mode of the occurrence in nature, with the view of encouraging his audience to visit and study the collection at their leisure, feeling fully assured they would add much to their stock of useful information by so doing

The general term, ores, is applied to those mineral substances which contain metals in union or associated with other substances, and it is the business of the smelter to separate those substances, and to obtain the metals in a state of purity.

A collection of specimens of ores of various kinds may be regarded in a three-fold point of view—first, as objects of natural history, in the same way as animals, plants, &c (in this way they are grouped and arranged in the British museum); secondly, as regards their mining and metallurgical value, dependent upon the per centage of metal they contain, and their value in the arts (it is with this view that the specimens of ores have been arranged in the Museum of Practical Geology); and, thirdly, with regard to the mode of the occurrence in nature, whether in beds, veins, or superficial deposits.

Professor Smyth then entered into a detailed explanation of the mode in which the minerals were arranged in the museum of the institution, having before him a sketch illustrating the situation of the various cases of ores, and explaining the nature of the contents of such cases, some being appropriated to British, others to foreign, and a third to ores the produce of the British colonies, whilst another contained specimens illustrative of the mode of their occurrence in nature.

The lecturer then proceeded to notice the ores of iron, as they are found in various parts of the world These were illustrated by means of the following diagram —

Ores of Iron.

Magnetic Iron Ore

Iron	72 4
Oxygen	27 6
	100 0

Specular Iron Ore (peroxide)

Iron	70 0
Oxygen	30 0
	100 0

Brown Iron Ore (hydrous oxide).

Iron	60 0
Oxygen	26 0
Water	14 0
	100

Sparry Iron

Protoxide of Iron	
Carbonic Acid..	
	100

The magnetic iron ore is found in Russia, Sweden, Elba, &c., but not much in this country.

The specular iron ore is very rich in metal, and is carried often to a considerable distance to be mixed with poorer iron ores, and smelted together.

The brown iron ore, though not so rich in metal, has the property of smelting "kindly."

The sparry iron ore is chiefly obtained in Styria, Carinthia, &c., and the iron and steel obtained from it is exceedingly well adapted for the manufacture of cutting instruments, as scythes, sickles, &c. There is another ore, that is called the clay iron ore, which abounds throughout our coal-beds, and forms the chief source of British iron.

The ores of lead next came under review, the principal of which, and their composition, was made apparent by the following diagram :—

Ores of Lead.

Galena (sulphide of lead).

Lead	86 7
Sulphur	13 3
	100 0

White Lead Ore (carbonate of lead).

Oxide of lead	83 6
Carbonic acid	16·4
	100 0

Of these ores the galena is by far the most common; occurring in beds and veins in conjunction with more or less silver; the general rule being that in proportion to the quantity of silver contained in the ore, the productiveness of the vein decreases The carbonate of lead ore would appear to be galena which has undergone some chemical action. Galena is the lead ore found in greatest abundance in this country.

The next metal which came under the lecturer's review was copper.—

Ores of Copper.

NATIVE COPPER

Red Copper Ore (oxide).

Copper	88 9
Oxygen	11 1
	100 0

Redruthite Ore (sulphide of copper).

Copper	79 8
Sulphur	20 2
	100 0

Copper Pyrites.

Copper	34 0
Iron	30 5
Sulphur	35 0
	100 0

The native copper is pure copper; it usually occurs of a dendriform shape, like the branches of a small tree or large piece of moss, and has a crystalline structure. The red copper ore is a very valuable ore, now being worked to some extent in the Pl[illegible] mine in Cornwall. The Redruthite ore, so called from its occurrence in mines near the town of Redruth in Cornwall, is another of these copper ores. About 100 years since, the Cornish miners were in the habit of throwing thousands of tons of this valuable ore into the Atlantic every year, not being aware of its real value. The copper ore of most frequent occurrence is the copper pyrites, which is conveyed from Cornwall, Cuba, and other places to Swansea to be smelted, although the analysis of good copper pyrites would indicate the quantity of copper mentioned in the diagram, yet the average of the copper pyrites ores does not run higher than from 4 to 10 per cent. Another ore of copper is the malachite, or green carbonate, which the visitor of the Exhibition will never forget, who found his way into the Russian department. The lecturer exhibited a specimen of malachite from the Burra Burra mines of Australia.

The ores of tin next claimed attention.

Ores of Tin.

Tinstone (oxide of tin).

Tin	79
Oxygen	21
	100

Tin Pyrites (bell-metal ore).

Tin	29
Copper	30
Sulphur	30
Zinc and iron	11
	100

The tinstone is the only ore of tin of any importance; it is very difficult to extract the ore from the bell-metal ore.

The ORES OF ZINC are as follows:—

Zinc Blende (sulphide of zinc).

Zinc	66 8
Sulphur	33 2
	100 0

Calamine (carbonate of zinc)

Oxide of Zinc	64 65
Carbonic Acid	35 15
	100 00

The lecturer then proceeded to speak more particularly of the mode of occurrence of minerals in nature. After referring to the information furnished by Professor Ramsay in the preceding lecture, with regard to the various strata, &c., composing the crust of the globe, the lecturer called the attention of his audience to the mode of occurrence of nodules or lumps of iron ore, occurring between beds or layers of shell, sandstone, &c., these nodules being in dispersed through the strata, it does not answer to sink a shaft to work them, in this case therefore an open cutting or quarry is formed, like that of a stone quarry, and the nodules of argillaceous or clayey iron ores are thus readily got at and removed. In another case, that in which iron ore occurs in the lower beds of the oolite, a discovery of but a few years, shafts are sunk for the underground working of this ore. Professor Smyth here remarked that this source of iron ore is one of great importance and value, it was first found in the Yorkshire oolite and has from thence been traced into Lincolnshire and Northamptonshire, producing many thousand tons to the acre. The supply of iron ore from this source enables us to look with less regret at the gradually decreasing supplies of ore from our coal fields.

Another mode of occurrence is that of thin beds extending [illegible] surface of more than a thousand square miles, as exemplified in the copper slate deposit of Prussian Saxony, Hesse, &c.

The alluvial deposits next came under notice, as illustrated by the tin ore, resembling gravel, found in Cornwall, and the gold of Siberia, California, and Australia [illegible] rocks containing these metals had gradually suffered from the decomposing action of the atmosphere and other causes, and the accumulated detritus or waste from this source had filled ravines and mountain passes in which the gold was now found in pieces, varying from small grains up to large lumps. On the lecture table was a lump of Californian gold weighing upwards of eighteen pounds, obtained from this alluvial deposit. In Siberia, a lump of gold was found of the weight of ninety pounds. In all these cases the angles of the lumps of metal are rounded off or worn away like gravel, by the continued rolling action and friction to which they have been subjected. Platinum and other metals usually associated with it are always found in the shape of small grains in deposits of this character.

The gold found in Wicklow at the close of the last century, of the value of more than £10,000, agreed in its mode of occurrence with the Siberian, Californian, and Australian gold.

Another mode in which minerals occur in nature is that of lodes or veins; in this case, a crack or fissure in the earth having been first formed, it has subsequently been filled with mineral substance, usually of a crystalline form, and apparently deposited from an aqueous solution. A good illustration of a simple vein may be seen in the case of a piece of black marble, traversed with a white vein, in this case the crack or fissure must have at one time been formed in the [illegible]le, into which a solution of carbonate of lime obtain[illegible] access, and there became crystallised. In the case of veins of granite and porphyry, these, no doubt, were produced by igneous causes, being in a melted condition when they f[illegible] their way into the cracks or fissures existing in other strata above them. In the case of metals, however, we have no evidence of igneo[illegible]

The difficult task of the miner, in his researches, may be imagined from the circumstance that there occur no less than 600 species of minerals, and many varieties of each species. The utility, therefore, of a school of mines, and of a good collection of mineral specimens open for the inspection of the miner, is thus obvious. A knowledge of the mode of occurrence of these minerals in nature is also of great importance. This is especially illustrated by the fact, that in some cases the mineral deposit takes place from above downwards, and in others from below upwards. In the former case the vein or lode gradually decreases *downwards*; in the other case it gradually increases *upwards*. An acquaintance with these facts is useful in determining the miner where to sink a shaft, so as to get at the thickest and most productive part of the vein or lode.

The lecturer then noticed those curious mineral deposits called *Nucleated*, in which a nodule has assumed a solid crystalline form under such a degree of pressure, that when the miner breaks it with his pickaxe, the confined air escapes with so much force as to rend the nodule into a thousand fragments, to the great danger of the miner, who is often injured by the violence of the explosion.

In conclusion, Professor Smyth expressed the hope that his audience would avail themselves of every opportunity they could obtain of inspecting the collection of minerals in the museum, assuring them that both he and his fellow-professors would at all times feel much pleasure in rendering them assistance in those examinations.

OLD MR. THEY-SAY

Who has not heard of the world-renowned They-say? His name is familiar with all men everywhere? The high and low, rich and poor, bond and free, honoured and despised, civilised and barbarian, Jew and Gentile, Mussulman and Christian, all nations, kindreds, tribes, and tongues, have heard of Mr. They-say. His name is almost a household word. But who has ever given the world a history of this eminent personage? Numerous as biographies are, no one has ever yet written and published the life of Mr. They-say. Pardon us if we undertake the task of writing a brief history of h[illegible]

HIS PARENTAGE.—His father's name is Slander, his mother's, Tattle; of his genealogy nothing more is known. He was born in the town of Evil-Report, in the kingdom of Sin.

HIS AGE.—It is not known in what precise age of the world Mr. They-say was born. It is the opinion of many that he was born soon after Adam and Eve were expelled from the garden of Eden. If they are correct in this opinion, he must be very far advanced in life, and we should naturally expect to witness in him all the evidences of feeble old age—grey hairs, sunken eyes, and palsied limbs. But he is really as strong and active, as fresh and [illegible]ump as hale and hearty, as he ever was. Remarkable old creature!

HIS EDUCATION.—Mr. They-say's education is very limited. What knowledge he has obtained is principally from hearsay; hence he does not get any correct knowledge of anything.—His deficient education has ever been a serious embarrassment to him, for he never dares to make a positive assertion, but guesses it is so, hopes it is so, and so on.

HIS PERSONAL APPEARANCE.—We have spoken of him as being as strong, as active, &c., as he ever was. But who has ever seen Mr. They-say? Have you? Has any one? If any one has, we know not the man. In our opinion he is as intangible as a phantom, which we can neither see, handle, analyse, nor describe. But we know he exists, because everybody is talking about him. And we have come to the paradoxical conclusion that he exists and does not exist, is everywhere and nowhere; is responsible and irresponsible—a sort of "will-o'-the-wisp, jack-o'-lantern" kind of being, whose personal appearance can never be described.

HIS CHARACTER.—He is distinguished for wickedness. He is a deceiver. A liar. A peace-breaker. Everything that is bad, without possessing one redeeming quality.

Reader, is Mr. They-say in your family? If he be, drive him [illegible]. Harbour him not a moment. Listen not to his vile slanders. He will involve you in trouble, and make his escape in the midst of it.

Christian brother, has he visited your little community? Beware of him. He will cause "divisions to spring up among you." Let him influence you, and your once prosperous society will be destroyed.

THE COALWHIPPER.

THE river-side from the Tower to Blackwall, on the southern shore, is lined with wharves at which coals are transhipped from the colliers to the barges. Above bridge—that is, between London and Westminster bridges—similar wharves exist, but they are simply for the reception of barges, from which the coals are carted away to various parts of the town. Above bridge, the men employed about the wharves and barges are coal *porters;* below, they are coal *whippers* or *heavers*—and the distinction is this; the latter class of men, of whom there are in the port of London about two thousand, are employed solely in hoisting, or "whipping," as it is termed, the sea-brought coal from the colliers to the barges; while the business of the former is to land the mineral from the barges to the carts in waiting. The former are generally paid by the

SOBER, AND IN FULL EMPLOY.

piece for their labour—one penny per ton per man—while the latter are simply hired weekly servants who, when not engaged at the wharves, are employed in delivering the sacks at the houses of the customers.

The coalwhippers are a harmless, simple, hard-working class of men, of whom we see little in the city, and of whom the world of London readers knows next to nothing. They live in the dark dirty streets and courts of Wapping, Shadwell, Ratcliffe, and Limehouse; and if any curious adventurer chooses to take a walk along the river side on Sunday morning, the chances are that he will meet some score of dusky men occupied in manner similar to our friend at the head of this paper. For coalwhippers are a domestic kind of people, whose chief pleasures—on Sundays at least—seem bound up in their children and their own white stockings. This is the brightest side of the picture, and as the coalwhipper is not one of the "heads of the people" very commonly "taken off," we propose to somewhat enlighten the world on the subject of his habits, manners, and occupation.

The visitor to Gravesend has no doubt noticed lying afloat off the southern shore of the Thames between Woolwich and the cockney watering-place numerous groups of black, low-lying, heavily-laden vessels. These are the colliers which bring the coals from the north for the use of the great metropolis. All the shore is marked out in tiers; and as the coal ships arrive in the river, the captains send up to the factors, through whom all the sales of coal take place, an account of the quantity and description of their cargo, and each vessel is then ordered to lie in one or other of the tiers in the Pool till she is allowed by the harbour-master to discharge her cargo at the wharves in London. Meanwhile, the factor at the Exchange in Tower-street has disposed of the coals. The fleet of colliers lying in the Thames sometimes—in severe winter weather, for instance, when the good folk of London require large fires—consists of upwards of 300 vessels.

We will suppose the collier—after having lain in the Pool for several days, or weeks, just as it may happen that the supply is greater or less than the demand—has arrived opposite Stepney church, and is about to discharge her cargo. A coal-meter or measurer is sent on board, by order of the city corporation, whose duty it is to see that each purchaser has his right quantity, and a gang of coalwhippers is engaged to land the cargo. Let us take a glance at the operation.

The collier being moored in the stream, with a barge fastened alongside, the labour of the coalwhipper begins. Everything is black about a collier. The vessel itself is as black as coal-dust can make it, the sails and cordage are of

WAITING TO BE HELD.

the same hue, and the men engaged are as dark as Africans. No matter what the original complexion of the labourers may have been—no matter what the colour of their hair or the hue of their garments, a few hours' work among the coals effectually removes all distinction between them, and the only whitish spots about them are in their eyes and their finger-nails.

To work a coal-ship properly, a gang of nine coalwhippers is necessary. The depth of coal in the hold of the vessel averages, from the deck to the timbers, about 16 feet; so that the height which the coals have to be lifted, including the "basket-man's boom," is not less than from 20 to 25 feet. The gang of whippers are thus distributed: in the hold four men are employed in filling the basket, relieving each other at regular intervals. Only one basket is used, which holds about 1¼ cwt. As soon as the basket is filled below, it is "whipped

up" to the deck by four other men, seized by the "basket-man" and tilted into the weighing-machine; the coals are then weighed by the coal-meter, and finally discharged into the barge below. These several operations are performed with extraordinary quickness and dexterity and in perfect silence. Sailors when they pull at a rope accompany their work with a not unmusical "Yo-heave-ho!" which, they say, helps them considerably; but the coalwhipper works in silence His labour is severe, and he goes at it as if he meant it.

Thousands of persons passing up and down the river (on business or pleasure), must have witnessed the operation we have just referred to, and have noticed the kind of half-apathetic, half-busy, and wholly-dirty air which pervades the colliers and the coal-barges, but few of the many understand precisely how coals are "whipped," though they may be familiar enough with the term coal "whippers." We will endeavour to explain this process, which may be said to be one of manual labour slightly aided by mechanical means

The basket having been filled below with coals, four whippers draw it up. They stand on deck at the foot of what is called "a way." This "way" resembles a rude short ladder, four or five feet in length, usually formed of four broken oars, and having four steps, about a foot from each other. The "way" is attached to a pair of upright spars called a "derrick," at the top of which is a "gin," which is a revolving wheel to which the ropes holding the basket of coals are attached. Knowing about the moment that the basket is full—for they never look down into the hold—the whippers skip up the "way," holding the ropes attached to the basket and the gin; and, pulling the ropes at two ships simultaneously as they ascend, they then hoist the loaded basket some height out of the hold; when hoisted so far, they jump down all together, keeping exact time in their jumps, from the topmost beam of the "way" on to the deck, so giving the momentum of their bodily weight to the motion communicated to the basket. While the basket is influenced by this motion and momentum, the "basket man" who is stationed on a plank laid across the hold, seizes it dexterously, runs it on, with the gin revolving, to the "boom," and rapidly reversing the basket, shoots the contents into the weighing machine. This is not only a very clever, but a very dangerous operation; for if the man did not seize the right moment for taking hold of the basket he would not be able to carry it forward, or would probably be precipitated into the hold The machine is something like a large wooden coal-scuttle, which holds about 2½ cwt. It has the proper weights attached, and the duty of the meter, who stands beside the machine, which hangs over the side of the ship, is to weigh the coals, and by pulling a rope discharge the contents of the machine into the barge. This, then—the filling the basket, "whipping" it on deck, tilting it into the machine, and emptying the coals into the barge beneath—is the whole art and mystery of "coal-whipping;" and a very curious and laborious, but not very ingenious, process it is

The usual amount of work performed by the whippers in a day is about 98 tons—when they are at work, which is not every day, owing to the supply of labourers being, except at very busy seasons, considerably greater than the demand for labour. To whip 1 ton, 16 baskets-full are required, so that the men employed pump up and down for each ton no fewer than 144 feet, and for a day's work of 98 tons, they jump up and down 13,088 feet! In some large ships the "way" has five steps, and ten men are employed. A single basket of coal, in a day's work such as we have described, is hoisted not less than four miles high—about twice as high as a balloon ordinarily ascends Sometimes 150, and even 200 tons are "whipped" in a single day. So much for the labour, now of the men themselves.

There are in the port of London upwards of 200 gangs of coalwhippers; so that, supernumeraries included, there must be upwards of 2,000 labourers employed in this kind of labour, about two-thirds only of whom are kept in regular work. Previously to the passing of the Coalwhippers' act in 1843, these men were employed and paid by the keepers of public-houses and beer-shops along the river side. The effect of this system was, that the man who spent most in drink—in fact, the greatest drunkard—earned the most money. Such a system was productive of the greatest evil; for, notwithstanding that these labourers generally earned good wages the demands of the publican masters were so great that the man was seldom enabled to take home to his family more than six or seven shillings at the week's end. There

that time no fewer than seventy public-houses on the north side of the river, below bridge, employing coalwhippers. The fruits of this mischievous plan of hiring are ably described by a recent writer. "When a ship came to be made up," says he, "that is, for the hands to be hired, these men assemble in crowds round the bar of the tavern, and began calling for drink, outbidding each other in the extent of their orders, so as to induce the landlord to give them employment. After being taken on, their first care was to 'put up a score' at the public house, so as to please their employer, the publican. In the morning, before going to work, they would invariably call at the house for a quartern of gin or rum, and they were obliged to take off with them to the ship a bottle holding nine pints of beer!—and that of the worst quality, for it was the invariable practice of the publicans to supply the coalwhippers with the very worst articles at the highest possible price When the men returned from their work, they went back to the public-house, and there remained drinking the greater part of the night. He must have been a very steady man indeed who could manage to return home sober to his wife and family. The consequence of this was, that the men used to pass the chief part of their days and nights in the public house, and it frequently happened that on the men settling with the publican on the clearance of the ship, it was found that instead of having anything to receive, they were brought in several shillings in debt instead." It would not be easy to describe the wretched condition of the besotted men, as the hour after hour in the tap-room waiting to be hired. The face of such a one the artist has drawn. Fancy a fine brawny fellow like that being obliged to waste his strength and lose his time in the loaded filthy atmosphere of a public-house. Some of these *publican* masters—who were no doubt *sometimes* as well—owned fifteen or even more colliers, and nearly all of them were the owners of at least two vessels. The children of the coalwhippers were almost reared in the tap-room; their wives were either made miserable drunkards like themselves, wasted away through poverty and grief, then sons turned out thieves and vagabonds, and were transported at the expense of the community, and the only persons who prospered were the promoters of all this mischief, who frequently retired, after seeing them houses for large sums, with immense fortunes. What any wonder that the coalwhippers of the port of London were reckoned among the dangerous classes? Was it any wonder that under such a horribly debasing system they were considered the most drunken, noisy, ill-behaved, miserable creatures? Was it any wonder that the men themselves, awaking at last to a right sense of their own degradation, met together and earnestly petitioned the government to step between them and their cruel taskmasters. That help, so long in coming came at last

In 1843, through the efforts of three coalwhippers, the attention of the government was called to the state of this ill-used class of men, and an act was passed which took away, at once and for ever, all power from the publican of injuring the labourer. Under this act, every man then following the calling of a coalwhipper was to be registered. For this registration 1d was to be paid, and every man desirous of entering upon the same business had to pay the same sum, and have his name registered. The employment is open to every labouring man, but every new hand, after registering himself, must work for twenty-one days on half-pay before he is considered to be "broken in," and entitled to take rank and receive pay as a regular coalwhipper. All the coalwhippers are arranged in gangs of eight whippers, with a basket-man or foreman. These gangs are numbered from 1 to 218, which is the highest number at the present time. The basket-men or foremen, enter their names in a rotation-book kept in the office, and as their names stand in that book, so do they take their turn to clean the next ship that is offered. On a ship being offered, a printed form of application, kept in the office is filled up by the captain, in which he states the number of tons, the price, and time in which she is to be delivered to the gang whose turn of work it is, before the ship at the

offered, then it is offered to all the gangs; and if accepted by any other gang, the next in rotation may claim it as their right before all others. In connexion with the office there is a long hall, extending from the street to the water-side, where the men wait to take their turns. There is also a room called the basket-men's room, where the foremen of the gang remain in attendance. There is likewise a floating pier called a dépôt, which is used as a receptacle for the tackle with which the colliers are unloaded. This floating pier is fitted up with seats, where the men wait in the summer. The usual price at present for delivering the colliers is 8d. per ton, but, in case of a less price being offered, and the gangs all refusing it, then the captain is at liberty to employ any hands he pleases.

According to the custom of the trade, the rate at which a ship is to be delivered is 49 tons per day, and if the ship cannot be delivered at that rate, owing to the merchant failing to send craft to receive the coals, then the coalwhippers are entitled to receive pay at the rate of 49 tons per day for each day they are kept in the ship over and above the time allowed by the custom of the trade for the delivery of the coals. The merchants, however, if they should have failed to send craft, and so kept the men idle on the first days of the contract, can, by the by-laws of the commissioners, compel the coalwhippers to deliver the ship at the rate of 98 tons per day. This appears to be a gross injustice to the men; for if they can be compelled to make up for the merchants' loss of time at the rate of 98 tons per day, the merchants surely should be made to pay for the loss of time to the men at the same rate. The wrong done by this practice is rendered more apparent by the conduct of the merchants during the brisk and slack seasons. When there is a slack time the merchants are all anxious to get their vessels delivered as fast as they can, because coals are wanting, and are consequently at a high price; then the men are taxed beyond their power, and are frequently made to deliver from 150 to 200 tons per day, or to do four days' work in one. On the contrary, when there is a glut of ships, and the merchants are not particularly anxious about the delivery of their coals, the men are left to idle away their time upon the decks for the first two or three days of the contract, and then forced to the same extra exertion for the last two or three days, in order to make up for the lost time of the merchant, and so save him from being put to extra expense by his own neglect. The cause of the injustice of these by-laws may be fairly traced to the fact of there being several coal-merchants among the commissioners who are entrusted with the formation of by-laws and regulations of the trade. The coal-factors are generally shipowners, and occasionally ship-owners, and when a glut of ships comes in, they combine together to keep up the prices, especially in the winter time, for they keep back the cargoes, and only offer such a number of ships as will not influence the market. Since the passing of the act establishing the coalwhippers'-office, and thus taking the employment and pay of the men out of the hands of the publicans, so visible has been the improvement in the whole character of the labourers, that they have raised themselves in the respect of all who know them.

Within the last few years they have established a benefit society; and they expended in the year 1847, according to the last account, above £646 in the relief of their sick and the burial of their dead. They have also established a superannuation fund, out of which they allow 5s. per week to each member who is incapacitated from old age or accident. They are at the present time paying such pensions to twenty members.

Further than this, they have established a school, with accommodation for 600 scholars, out of their small earnings. On one occasion as much as £80 was collected among the men for the erection of this institution.

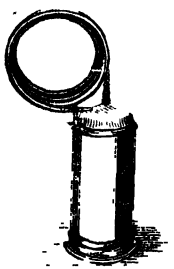
From the above slight sketch it will be seen that the "coalwhipper," far from being naturally the drunken, careless fellow he was under the rule of the publicans, is, in fact, a hard-working industrious labourer, whose occupation becomes respectable by just so much as he learns to respect himself. The coalwhipper, emancipated from the thraldom of strong drink, is a loyal man—as the spontaneous offer of himself and his fellows as special constables on a certain celebrated occasion sufficiently proves; he is a careful and provident man, as the above paragraphs testify, and he is an affectionate and domestic man—if we may believe the artist, who no doubt drew from the life. Mark how carefully he carries the gaily-dressed, laughing, healthy little fellow in his arms; observe the look of grateful pleasure on his face, and the rude yet touching attempts to make the most of his poor garments. Surely none who look at the picture can pronounce the coalwhipper in the picture to be a careless father or a bad man.

We are informed that the ballast-heavers labour under similar disabilities, with regard to their employment by publicans, to those we have described above. We shall inform ourselves of the facts before we speak further on the subject.

SUPPLY OF WATER TO THE METROPOLIS

The impurity of the water supplied to the metropolis has been the subject of discussion and complaint for the last thirty years. The Thames, from which much of this supply is drawn, is one of the most impure streams in the world below the London bridges, however pure it may be at its source. Many laudable attempts have been made by the water companies to improve the quality of the supply, but with very variable success. The river water is still muddy in appearance and putrid in odour, even after time has been allowed for the grosser impurities to subside, it also abounds in insects and animalculum, which no ordinary method of filtration can remove. To the use of this foul and disagreeable diluent in food, may be traced, as an approximate cause, many diseases which are common in the metropolis, as flatulency, indigestion, impurity of blood, dysentery, and cholera. To the exhalations arising from this water, when allowed to stand in cisterns, water-tubs, reservoirs, &c, may be traced malaria or miasma, the fruitful source of the low and intermittent fevers peculiar to marshy localities, and abundant in London whenever the water with which it is supplied is surcharged with an unusual quantity of vegetable matter in a state of decomposition.

It is well known that pure water is absolutely necessary for the preservation of health, not merely as an article of diet, but in all culinary preparations, and it is very evident that unless this beverage be supplied more effectually than it has hitherto been done all the sanitary regulations of the legislature will be unavailing. As to the spring water supplied by the wells in London and its vicinity, it is so impregnated with mineral and earthy substances, that it is quite hard and unfit for cleansing or dietetic purposes, and by no means so well adapted to the human constitution as the fine soft water of the river when carefully filtered and freed from all its impurities. Moreover, this water cannot possibly be obtained in sufficient quantity for general supply, and it is now well ascertained that the scheme of supplying the metropolis with water by means of artesian wells is a complete failure.



The ordinary method of boiling the river water, in order to free it from its impurities, can never be systematically effected for all useful purposes, on account of the expenditure of time, fuel, and apparatus, which it would require. Besides, when this water is boiled, the impurities are boiled with it, and it is rendered quite as disagreeable to the palate as before, if not more so, while it remains as unfit as ever for the more important culinary preparations. Boiling makes the water lose that fine, brisk, and sparkling appearance which it naturally possesses, by depriving it of the atmospheric air and other useful gases with which it is impregnated. It also destroys very soon all kitchen utensils and boilers employed in the process, by the "fur" which it collects on their bottoms and sides, and the process itself becomes at last so slow, in consequence of this defect, that the common proverb is truly verified, "The kettle won't boil, there is surely a stone in it!"

The only effectual remedy for this state of things is the *process of filtration* conducted on a plan adapted to the general convenience of the public, and imitative of nature herself in the construction of her "crystal fountains." A filtering apparatus which will accomplish this most desirable end must be made of a substance both cheap and durable, easily obtained in large quantities, clean in its nature, and not liable to injury by water or the action of the atmosphere. It must also contain a filtering

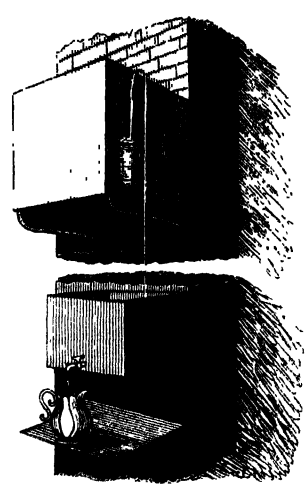
medium free from organic deposits and excrementitious matter, such as are found in sponge and other filtering media commonly used It must perform the process of filtration with such rapidity as to supply the wants of the public in the shortest possible time, and be capable of such a compact and convenient form of construction as to be easily handled and applied without the employment of mechanics or workmen. It must, in fine, be capable of instant adaptation to any cistern, water-tub, reservoir, pond or fountain, in private houses, public buildings, manufactories, mills, &c.; and its construction must be such that it can be cleaned, repaired, and replaced in its position for immediate action with ease, expedition, and certainty.

An apparatus possessing most of these requisites has been invented by Mr. Alfred Bird, of Birmingham. It was exhibited in the Crystal Palace by the Wenham Lake Ice Company, Strand, where it may be always seen in operation, and is called the "Hydrostatic Syphon Water Purifier.' It consists of a small cylindrical metallic vessel, furnished with a tube and stop-cock, in the interior are two inverted cones and filtering media, through which the water ascends, when, by exhausting the tube of its air, it becomes a syphon As soon as the vacuum is formed, which may be done in a few seconds by drawing the air out of the tube by the mouth, the filtered water begins to flow freely, and may be drawn off for immediate use The simplicity of the action of this instrument, depending merely on the pressure of the atmosphere, is such as to recommend it at once to universal adoption It is made of a pure white metal, as brilliant and more durable than silver, and the size of the cylinder for common purposes is only four inches in diameter and seven inches in height, the tube, of course, may be made of any length to suit the cistern to which it is applied it will filter from one to two hundred gallons per day To set it in action, it only requires to be dropped into the water, however impure, the pipe being allowed to hang outside the cistern or water-tub Fig 1 represents the filter with the tube coiled up for convenience of packing Fig 2. represent the filter in operation, applied to a common rain water tub. When the pipe is carefully uncoiled, it may be bent and hung over the tub without injury to the apparatus If the cistern be deep, the filter can be suspended by the bend of the pipe over its edge, taking care that the cylindric l part is always under the surface of the water. If the cistern be shallow, the filter should be made to stand on two bricks at the bottom, to keep it free of the sediment If the stream in the pipe should become small, the filter wants cleaning, this is done by taking it out of the cistern, and blowing through the pipe till all the water is forced out at the bottom of the cylinder, this will carry off the impurities; and it may be replaced whenever it is found that air only is blown through at the bottom, the stream will then be as full as ever.

Fig 1.

BIRD'S SYPHON FILTER

To complete the application of this ingenious, scientific, and valuable filter, the company above mentioned have introduced the use of wrought iron enamelled cisterns It is well known that besides the injurious effects arising from the impurities of the water supplied to the public, others arise from the use of lead or zinc cisterns; the fact, indeed, is acknowledged by all chemists and scientific men, that the purer the water is, the more readily is it affected by the lead, and rendered injurious to the consumer It will be in the recollection of our readers, that the ex-royal family of France, when living at Clermont, were in danger of being poisoned by the water from the cisterns in that royal residence. The new cisterns are made of wrought iron, and are completely cased by a *glass enamel* fused by great heat, which resists the strongest blow; it never chips off, and there is no deleterious article in its composition like the ordinary enamel, which is known to contain arsenic. Fig. 3 represents the patent glass enamelled reservoir receiving the water from the syphon filter, which is in operation in a common cistern.



These two inventions are evidently perfectly calculated to supply the grand desideratum of pure water, and they may be immediately applied to domestic use by every householder in the metropolis.

Fig. 2.

FOR CISTERN AS

Fig

ENAMELLED CISTERN AND FILTER.

WHILST men remain the slaves of appetite or the sport of incident, as long as their aims and purposes centre in self-interest, and pleasure rather than purity constitutes the summit of their ambition, they are strangers to true dignity of character—they are capable of brighter honours than they have ever sought, and of nobler triumphs than they have ever won.

THE SEAMSTRESS.

"'Tis a lesson you should heed—
Try, try again;
If at last you would succeed—
Try, try again"—

Sang the little Laurie Amslie, as, interrupting herself in her song, she jumped up from the low ottoman upon which she had been seated, and ran lightly to her mother, sitting near the window.

"Only see, my darling mother, how nicely I have sewed this. Ah! you may turn it over, all is safe *this* time. Not *one* pucker—not *one* false *stitch!* Now, mother, have you not some hopes of me? Praise me, I beg you; for I am dying for a few words from your lips."

"You will not give me a chance to slip in a word edgeways, chatter-box," laughed her mother. "But I will say, your piece of work looks very nice for a little seamstress of twelve. It is essentially necessary that every woman should learn to sew; and 'what is worth doing at *all*, is worth doing well.'"

Thank you, mother; let me kiss you for that. And now you must not forget the promise you made me. See!" and she held back the curtains from the window, "only see how beautifully fast the snow is falling. Old Mother Goose is picking her chickens finely this afternoon; and there will certainly be no papa to-night. This is the very time, mother, for—but look how sweetly little Eddy is sleeping in his crib! Dear, dear baby!" and she kissed his chubby hand, extended on the coverlet.

"Don't wake him, Laurie, but bring me my knitting-basket, and I will tell you a story. But what must it be about?"

Something about yourself, I hope. Do you know, mother, I had rather hear about yourself and papa than any other persons in the world. So please think about something concerning your young days to tell me."

"I have told you, I believe, everything I can recollect about myself; but as it is a reward for careful and neat sewing, I will tell you a story about a seamstress, who lived with my mother, when I was a child."

"Oh! that will be delightful. Here, mother, put your feet on my ottoman, I have plenty of room, and now you are so nicely fixed, you can begin at once."

"Well, once upon a time," said Mrs. Amslie, smiling.

"Oh, mother, you are doing that to tease me, when you don't wish to tell it good. Don't begin—'*once upon a time*'"

"Ah! I see my little daughter is out-growing that pretty commencement to my nursery stories. I shall soon have you criticising my manner also. Well, to commence anew. My mother, whose health was very delicate, was obliged, from that circumstance, to keep a seamstress to do all the making and mending incidental to a family of which I was the eldest daughter. By the way, I may as well add, in speaking of myself, that it seemed from my earliest childhood, that I was wedded to books, and above all other books, were novels. My mother allowed me to read whatever I wished; trusting to her own excellent precept and example to counteract whatever of evil tendency they might inculcate. This I mention as a warning to you; for my passion for that kind of reading prevented me from employing what leisure time I had in learning to sew, and other useful employments, which might be of service to me in time to come. A piece of work like that which you have executed this afternoon so neatly, would have seemed as impossible to me as the most difficult of the problems of Euclid.

About this time, there came as seamstress for my mother, the prettiest, most gentle, and most lady-eyed young person I ever met with. I was about your age when she came; and my heart was taken instantly captive by the dove-like Susie Lee—for so she was named. She lived with us as one of our family; going home once a month to see her widowed mother, who lived five miles from our residence. Everybody's good opinion seemed won by her gentleness as well as mine—for a sweet creature was Susie Lee, and one who had undoubtedly seen trouble. Sometimes I would be sitting in the room, reading, when she was employed at her work, and I would be startle at the sobbing sigh which often escaped her lips.

"One day I had been reading a story, in which the heroi was, to us a common expression, '*in a peck of trouble*' about lover, to whom her father was much opposed. At last lo conquered; and I closed the book with the expression, u tered aloud, of 'How glad I am she married him!'

"'Who, Miss Laurie?' said Susie Lee.

"'A young gentleman and lady, about whom I have bee reading. But let me tell you all the story.' And I accordingly in my child-like language, gave her the substance of the tal Susie's head, as I spoke of the young girl's grief, bent lowe and still more low over her sewing. Finally, I brought m narrative to a close, by the question, 'Wouldn't you hav acted as she did, Susie, if you loved any one?'

"She lifted her face, and I was surprised to see the mi eyes full of tears, and the generally pale face now flushed a stained by the drops which had been falling plenteously.

"'What is the matter?' questioned I, sympathisingly; n own eyes filling at her apparent grief.

"'Nothing—nothing now. Forget that I have been fooli enough to cry, for I was only low-spirited. You asked m what I would do if I loved any one, as the lady you we speaking of—I should *not* act as she did, my dear child; f the first duty, after our love and obedience to God, is that our parents. No man truly loves a girl if he wishes her to a in disobedience to their commands. No, no—never!' Sh spoke lower and more agitated, as if communing with her ov heart—'impossible to love her, and yet try and make her a in direct contradiction to her Maker's will. It is hard to what is right in this world; very, very hard, when one's *o heart* is pleading and urging you on to disobey. But then t Father will strengthen the weak ones who know their fault and will call on *him*.'

"Her face was like the face of an angel in its expression, she finished her communings, as I may term them, by an u ward glance, full of hope, yet humble. Child as I was I watch her; for this show of feeling from the meek seamstress was i teresting to me. But, except the trembling of her fingers, she threaded her needle, or arranged her work, she gave n further evidence of it.

"April, that month which always reminds me of child hood, with its sunny smiles and tears, had come; and m mother, always indulgent in every way, had promised that should accompany Susie Lee home the next time she paid visit to her mother. The Friday—the day of our promis visit—was looked forward to by me with all the glad antic pation with which a child ever dreams of something new. Th carriage was to convey us there, and, moreover, my entreati and Susie's own good deeds had obtained a week's holiday f our visit—a whole week, think of that. Even her rather s face became almost gladsome at the prospect. As for myse I bounded here and there over the house till I am sure my po mother congratulated herself when I was gone.

"We rode on chatting, or rather, I questioning and my com panion answering and describing, till we arrived within a m of the village, or the remnant of what had once been a villag I proposed to Susie to get out and walk to her mother's. A cordingly, out we got; and I began scampering along li something wild, for the mild, clear atmosphere appeared have infected everything with a spirit of frolic and joy. Lig fleecy clouds were in the blue expanse; and on the still eve ing air came the delicious perfume of the crab-apple, yello jessamine, coral honey suckle, and numerous other odours, i mingling together and pervading our senses with their exquis aroma. Soon we came into the village, which, like anoth Talmûd of the desert, was thickly spread with its ruin dismantled cottages, while here and there an old chimn showed where families had once dwelt, who were now, pe haps, resting in the cold and silent tomb, or had moved f away.

"'Are we almost at your home, Susie?'

"'Yes. Do you see that little white house, with the garde in front? Well, that is it. Drive there, Uncle John, and p down my trunk and Miss Laurie's band-box, and I will m mother we are close behind.'

"The last house in the *one* street was Mrs. Lee's—and v quickened our pace as we drew nearer to the end of our jou

ney. The remembrance of that simple visit is as fresh in my memory now as if it chanced but yesterday.

"We passed through the little garden, in which grew some simple flowers, such as roses, crocus, &c. Susie sprung eagerly forward to embrace her mother, who was standing in the doorway to welcome us. How she must have loved that old mother, for her face was beautiful with its tender expression. Mrs. Lee was a neat body, tall and straight, and dressed tidily in a purple calico gown, and thin muslin cap. She shook my hand warmly as she invited me in. In the centre of the room stood the round-table, already spread, with its snow-white cloth, blue plates, and brightly flowered tea-tray.

"'I thought, Susie, that you and the little Miss might be hungry after your ride—and so I got tea ready. After you have rested a bit, sit up to the table and eat.'

"And whilst the old lady stirred about actively, finishing her hospitable arrangements, I glanced around. The floor was as white as soap and labour could ever get boards, and the room, though poorly furnished, certainly had the charm of neatness. On one side of the apartment was an old-fashioned mahogany table, black with age, and whose legs looked so thin as to render it doubtful how long they would be able to support the body. Around the room were arranged a half-dozen of chairs, gorgeous in flowers, and gilt, as when first brought from the cabinet-shop; and before the fire a large and comfortable-looking rocking-chair, with a cane-seat, and which Mrs Lee afterward told me was a present from Susie. A piece of home-made carpeting served as a hearthrug, and burning on the newly painted hearth was a cosy fire, before which, to keep warm, was the *cunning-looking* little black teapot, and two covered plates. On the mantle-shelf were brightly burnished brass candlesticks and a little flower-pot filled with spring's early blossoms. A large family Bible lay on the table, above which hung profiles of the family, in small gilt frames.

"'Come, sit up, Miss Laurie, to our plain fare. Susie, take that seat, and help the young lady to a piece of ham, if she will choose a bit.'

"What a delicious little supper that was! I am sure I never enjoyed such another one—for I was very hungry, and everything looked so clean and inviting. Mrs Lee, too, was so hospitably pressing, which, as every one knows, is pleasant to a child; and, for the first time, also, I drank *real* tea, not hot water.

"'Take another bit of this toast—'tis so thin, you can eat more than one slice. You will not? Then Susie, hand that plate of cake, and saucer of preserves. you must try them.'

"I know that all these details, simple though they be, are pleasing to you, my daughter; but any one else would be heartily tired by this time. I learned from the conversation between mother and daughter, that Mrs Lee had a son called John, at that time at sea; and 'twas through him, aided by Susie's simple earnings, that she derived her support. The little house in which she lived also belonged to her, and she concluded, raising her eyes in thankfulness—

I am sure I ought to be grateful to God for his blessings. I owe nobody anything; and though I am not rich, yet I have health, and two of the best children on earth. Yes, Miss Laurie, that child washing up the tea-things, I w even before her face, is the best daughter in the world. I could not tell, and if I did, *you* would hardly be able to understand, all that she has done for me. May Heaven bless her!'

"The tea equipage being washed and put away, and Mrs Lee having retired to the kitchen, Susie and I seated ourselves on the door-steps, as it was twilight, and the room warm from the fire.

"'Good evening, Miss Susie,' said a young man, who stood on the outside of the gate. 'I saw you go by, and so I thought I would call to inquire how you were getting on.'

"This salutation was most commonplace, as well as Susie Lee's answer; but the voice of the young man was agitated, and my companion visibly trembling and blushing as she replied.

'I have not heard from you, or of you scarcely,' continued she, 'for the last two months. Was this right, Susie? Was doing as you would be done by? God knows that *we* had no quarrel, and yet I must suffer *all*. Yes, I will repeat it, *all*; for you surely never loved me, to treat me in this manner.'

"'How unkind of you, Robert, to speak thus. Never loved you! You *men*,' continued she, speaking indignantly, 'can never understand *us* thoroughly. It is *you* that never really loved *me*, or you would not reproach me for doing my duty, but would encourage me. Oh, Robert—'

"She had advanced to the gate, and seemed, in her grief, to be forgetful of my presence, and thus I listened to a *real* love scene.

'Why do you drive me, then, to it, after all that we have been to each other for the last two years. You are a free woman, as I *am* a *free* man; and will you let the quarrel of two old women part *us* for life? You have never had cause to find fault with *me*, and but for some meddling fool, who had to repeat to you and your mother what mine uttered in a moment of anger, all this had never happened. But I can stand it no longer. I have followed your footsteps for the last six months, though unchecked by you, and frowned on I your mother, content to steal, like a thief in the dark, round your house, so I could but catch a glimpse of you, or a chance word from your lips. And then you left here, and my life has had no comfort since. But, as I said, I cannot stand this any longer, and I have determined that *you* shall decide for me to-night. Now, Susie, if you *ever* loved me, or do *now*, listen to my proposal. Marry me at once, dear Susie, and the old people will be obliged to make it up. Do not answer now, but take till to-morrow to think of it.'

"'I *do* love you, Robert, *that* you well know, though you talk as you do. But my answer will be to-morrow as it is now—as it will *ever* be. I cannot marry you without the consent of your mother and my own. Let us wait patiently and lovingly, and God will yet bring all right.'

"'No, 'tis no use for me to wait any longer. I am losing the best years of my life in this hoping, dreaming state. Well, you will *not* marry me, you say. Well, here for the sea, and may I never see this cursed place again. Good bye!' and the excited young man held out his hand to her.

"Meekly she took it, but her feelings overcame her self-command, and she laid her weeping face upon it, whilst her heart-anguish wrung forth the cry of

"'Oh, Robert!'

"The young man was softened, his voice trembled, and he passed the other hand across his eyes, as he said—

"'Then consent, Susie. Why will you make both yourself and me miserable?'

"'No, Robert—my answer is still the same, and though if you will go my heart *must* break, still, if I cannot induce you to stay without swerving from my duty, then I must say fare well!' and may God help us both!'

"At this moment Mrs Lee came to the door, and the young man turned off. Susie, weeping, passed her mother and myself, and went up stairs, and from thence we could hear her convulsive sobs.

"'Poor thing!' poor thing!' said her mother, as she rocked to and fro; 'twill be the death of her yet, I am sure.' She questioned me closely about all I had heard. I told her, and begged her to comfort Susie by granting her consent.

"'No, my child, she is seeking comfort from *One* who can give it to her better than I can. Most gladly would I give *my* consent if that would insure her happiness, but 'tis not mine she needs—'tis *his* mother's, who not only withholds it, but utters harsh words against my daughter. Of e not go into any one's family against their will, for Susie Lee, though poor, is well-born. Mrs Murray, Robert's mother, is as good-conditioned a woman as you would meet anywhere; but some wretch has been poisoning her mind against Susie, and we cannot come to an understanding. When it first took place, I advised my child to run over to Mrs. Murray, and ask her what she had heard. She did so, but Mrs Murray would give her no satisfaction, but insulted her. Since then we have had no intercourse at all, and I hear she says she would rather see Robert a corpse in her house, than to marry my child. Robert, poor fellow! will keep hanging about when Susie is here; but I can give him no encouragement. But it will all come out, one of these days, mind my word, who is to blame."

"I have told you, my daughter, that I was naturally romantic, and that novel-reading had increased this tendency. And

lay awake that night, and listened to Susie's sighs—for she slept in bed with her mother, and shared the same chamber as myself—I resolved to act the part of a heroine, and to smooth the path of Susie Lee's true love. And with this resolution I sank into a sweet slumber.

"The morning sun, beaming on my eyes through the undraped windows, awakened me. The first object that my eyes fell upon was the still paler and more sad-looking face of Susie Lee, as she sat near the window sewing. When she found that I was regarding her, she endeavoured to smile and speak cheerfully. My heroic resolutions still continued in full force; and so, after breakfast, whilst the old lady was engaged in her household duties, and her daughter arranging the room up stairs, I took my bonnet, and slipped out on my proposed jaunt.

"I inquired the way to Mrs. Murray's. A white-headed, dirty-faced little fellow, who was rolling in the sunshine, and scratching with his naked toes in the dirt, jumped up, and very willingly agreed to show me. On I started, with a courageous heart, after my little dirty guide. When I arrived at the house, and had knocked, I found my courage oozing out. It was by far the most respectable looking mansion in the village, and everything around showed that the owners were in comfortable circumstances.

"I heard a quick step in the passage a moment, and an old lady, with an open, pleasant countenance came to the door. How my heart beat as she said, 'Good morning,' and glanced at me inquiringly. But she looked so staid and good-humoured that I took 'heart of grace,' and when she asked me, with a smile —' What do you wish, my little daughter?'

"'I wish to see Mrs. Murray, ma'am,' I stammered out, and again my little heart went *pit-a-pat*, for I knew not what to say next.

"'I am Mrs. Murray, my dear. Come in, and tell me your business, for it is as cheap sitting as standing.' Come in—as she opened another door, and ushered me into a neat little room nicely furnished, and looking as bright as a new pin.

"'Now, tell me what you wish.'

"'You must not get angry with me, Mrs. Murray, but I must tell you about Susie Lee. She sews for my mother, and is so good and so gentle that we all love her, at home, very much. Mother allowed me to come with her, and I am to stay a week, and although she always looks sad, as if in trouble, we never heard her complain; but I thought it was because she was poor, and was obliged to sew for her living, and was forced to leave her mother and stay among strangers. But I found out myself last night what caused her sad looks. Do listen, and don't get angry now, please ma'am,' said I, approaching her, for I noticed an ominous frown and a pout on the pucker of her mouth.

"'Why, bless me, child! but you are mighty young to talk about such matters. Did the girl or her mother send you?'

"'Neither, Mrs. Murray,' said I proudly and boldly, for I was indignant. 'I tell you that *I* both *saw* and *heard myself*. And, last night, when she sobbed, and prayed so earnestly for help to do her duty—and that when she thought we did not hear her—I determined to come and tell you. For I had heard Mrs. Lee say you were a good woman, but that some mischief-maker had set you against Susie.'

"'Did she really say *that*?' asked Mrs Murray. 'Well! I must say, it was neighbourly and Christian-like after what had passed. Perhaps I have been too hasty. And the poor girl herself I always loved, with her nice, tidy affectionate ways. My boy, too, has never been like himself since this trouble began. Tell me all about it, my dear, I will promise to listen.'

"And I did tell all, exactly as it occurred. The best orator surely could not have received a greater compliment than myself when I finished, for Mrs. Murray, with tears streaming from her eyes, said

'Bless your pretty little mouth! I must kiss you, for you speak like an angel. And you will be blessed, my child, depend on it, for God himself says. "Blessed are the peacemakers, for they shall be called the children of God." Wait, till I change my cap, and I will round with you to widow Lee's, and it shall not be my fault if we don't make everything straight between our families.' Mrs. Murray brought me a plate of nice cake to refresh myself whilst she completed her toilette.

"What a glad heart and light step had I, as I walked through the village beside Mrs. Murray. I knocked at Mrs. Lee's door, which was opened by Susie, whose pale cheeks became beautifully crimsoned as she saw my companion.

"'Forgive me Susie,' said Mrs. Murray, as she held out her hand. Susie Lee extended her hand most readily, but tears choked the words she attempted to utter. Mrs. Murray embraced her, and then turning to Mrs Lee, who had risen, said: 'Forgive me also, old neighbour, and let me explain it all. I am sure you will not blame me so much.'

"It is not needful, my dear, to enter into this explanation; at least, as it was given by Mrs. Murray, for I assure you it was a lengthy one. I must tell you, however, that mischief-making tongues had been busy with these loving hearts. A girl, not much older than Susie, who it was believed had a fancy for Robert, had whispered to the old lady, his mother, many a speech as to her future daughter in law; Mrs. Murray, not being blessed with the patience of Job, returned them with interest, and proceeded to active measures, such as had caused the sorrow of those young and attached hearts.

"'Good bye, Susie. I will send Robert here as soon as I get home,' said Mrs Murray, to the smiling, blushing girl, as she parted with her. 'You two must make it all up between you, and make haste, too, and come home to us, for that wilt keep mischief from brewing again.'

'Let me say to you here, my Laurie," said Mrs Ainslie, in conclusion, "always to avoid gossips as you would a snake, for they are quite as dangerous."

'And now but little remains to be told. I stayed the week, the old lady amusing me with tales of her own young days. Susie and Robert, though very grateful, had then time fully taken up with each other. Susie returned with me, but she gave notice to my mother of her marriage. My kind parents, whom I had told them of my share in the romance, kissed and praised me, and allowed me to purchase presents for Susie Lee's marriage. I was at the wedding, and afterward used often to go to see them, and I never beheld a more loving couple, or a family that enjoyed more domestic peace.

'And now, love, if you will be as good a daughter to me as Susie Lee was to her mother, I shall not think my time lost in having told you her love story."

LITERARY NOTICES.

THE First Volume of the present series of the WORKING MAN'S FRIEND will be ready April 1st containing the HISTORY of CHINA and the CHINESE; and also the HISTORY of HUNGARY complete, profusely illustrated with Engravings, price 2s. 6d., neatly bound in cloth and lettered. Cases for binding the Volume (1s each) will also be ready at the same time.

JOHN CASSELL'S SYSTEM OF NATIONAL EDUCATION, which he proposes to establish without asking for any special Act of Parliament. He only asks that he intends to seek from the Legislature is, the repeal of the iniquitous and obnoxious tax upon the medium through which he proposes to convey his system of Education to the people, namely *Paper*. On Saturday April 3 John Cassell's System of National Education will be inaugurated by the publication of *the first number of the* POPULAR EDUCATOR, in sixteen pages of double crown octavo price ONE PENNY. The whole system will be developed through the medium of *Weekly Numbers*, one penny each, or in Monthly Parts, 5d each, according to the number of weeks in each month. This System of National Education will include English Grammar, French, German, and Latin, Mathematics, Geometry, Arithmetic, and Algebra, Astronomy, Geography, Geology, Natural History, Botany, Physiology, Chemistry, Mechanics, History, Biography, Political Economy, Music, &c &c. Every section of the system will be explained in the most clear and comprehensive manner, and, where it is necessary illustrated with suitable diagrams. The whole will be written in a style sufficiently familiar to be perfectly understood by any child or youth who has merely learned to read, and which will at the same time interest and instruct both parents and children, and tend to promote universal education upon sound principles, and by an expeditious method of first-rate attainments are engaged to develop

John Cassell's system of National Education, under the editorship of Professor WALLACE, A.M., of the University of Glasgow, Collegiate Tutor at the University of London, and author of various popular and scientific works. THE POPULAR EDUCATOR can be ordered through

MISCELLANEA.

the peace of our spirit, the stillness of our thoughts, the evenness of our recollections, the seat of meditation, the rest of our cares, and the calm of our tempest: prayer is the issue of a quiet mind, of untroubled thoughts; it is the daughter of charity, and the sister of meekness.

TRIFLES NOT TO BE DESPISED.—The nerve of a tooth, not so large as the finest cambric needle, will sometimes drive a strong man to distraction. A musquito can make an elephant absolutely mad. The coral rock, which causes a navy to founder, is the work of worms. The warrior that withstood death in a thousand forms may be killed by an insect.

ENAMELLED VISITING CARDS.—We believe it to be correct to state that 7 years is the almost ephemeral average of existence in the trade for applying the poisonous surface to the petty token of pride—a visiting card. Is such slow and steady sacrifice to the Juggernaut of fashion more commendable, or less shocking, than a lottery of danger, in which some draw the prize of competency, and others the terrible blank of annihilation?

BLOOMERISM IN CAPITALS.

And not to compare with coats-pet-T

BRILLIANCY OF BILLY VICKERS.—At a school examination previous to the holidays, the master determined to give a finishing stroke to show off the proficiency of the scholars, as well as to give the parents and visitors a touch of his quality—as a superfine professor of penmanship shows the "copperplate style." Propounding and expounding the questions to his dear scholars, he concluded (not very grammatically) with this grand question and key to the art of writing—"What's the three first requisites of penmanship?"—A shockheaded and auburn genius, with a decided touch of the vermillion, burning to be distinguished as a prize-holder, shrieks out, "Easiness, legibilities, and dispatchitiveness!"—"Who's that?" says the Professor.—"I, Billy Vickers!"—Old Mr. Vickers, with a tear of pride at the achievements of his son Billy, exclaimed, "Well, Billy, after that, you must go to college and learn algebragy."

THE MISSISSIPPI.—The navigable rivers of the Mississippi alone show a navigation of 20,000 miles, while their entire length is 51,000 miles. Thus—Mississippi and tributaries, not including those given below, aggregate length, 14,385 miles; Red and all tributaries, aggregate length, 4,125, Arkansas ditto, ditto, 5,540, White ditto, 1,650; Ohio ditto, ditto, 10,730; Missouri ditto, ditto, 12,170; Illinois ditto, ditto, 1,270; Wisconsin, 675. Total—Mississippi, with all its inlets, 60,645; outlets or bayous (in all), 456. Total length of "The Great River," with all its parts, 51,000 miles.

ANSWERS TO CORRESPONDENTS.

[illegible] intestate, the next of kin takes the property.

A READER is anxious to know how gold leaf may be applied to leather? We believe great pressure in moulds of metal to be the plan commonly pursued, but of course gold leaf may be applied to leather as it is to paper, wood, &c., by simple application over a weak solution of size.

MARY should learn the following guide for [illegible] ears and but a single tongue, by [illegible] to man belong; the lesson she would teach is clear: repeat but half of what [illegible]

[illegible] CLARK complains of annoyance from [illegible]. A plant which grows in abundance in every field, the Dog's Tongue (the *Cynoglossum Officinale* of Linnæus), has been found by Mr. Boreaux to possess a very valuable quality. If gathered at the period when its sap [illegible] laid in a house, barn, or granary, or any other place frequented by rats and mice, these destructive animals immediately shift their quarters.

W. LAW.—The process of softening water by means of caustic lime has been tried and found perfectly practicable at the Chelsea Water-works. One pound of chalk, when calcined, will produce [illegible] istic lime, which [illegible] of lime-water, and be sufficient to mix with 560 gallons of ordinary London pipe-water. We [illegible] [illegible] ch this method [illegible] regularly and successfully adopted in household practice—of course on a small scale.

J. R.—Jean Paul says "Love one human being purely and warmly, and you will love all. The heart in this heaven, like the wandering sun sees nothing, from the dew-dre[illegible] but a mirror, which it warms and fills [illegible] writer) lives seventy years. The first [illegible] his human years, and pass swiftly by; he is healthy and happy—he labours cheerfully, rejoices in his existence. The eighteen yea[illegible] the ass come next, and burden after burden is heaped upon him; he carries the corn that feed others, and blows and kicks are the [illegible] of his faithful service. The twelve years o[illegible] dog follow, and he loses his teeth, and is [illegible] corner and growls. Wh[illegible] [illegible] form the conclusion. The weak and sick, becomes the sport of children.

THOMAS SWINDLEHURST.—The population of Manchester, according to the last census, taken in June, 1851, was 228,137, being an increase, since 1841, of 30,014 persons. The population of Leeds is 101,331, while in 1841 it was 88 741, th[illegible] 109,011, and that of Glasgow is 333,657, and the port of Glasgow, 47,951. To the population of all these places, however, must be added the numbers of males serving in her Majesty's forces, and all those engaged in seafaring or other occupations who were not actually sleeping at home the night of Sunday, March the 31st. The population of Manchester proper only is given, while that of Salford (87,714) and the towns in the neighbourhood of Manchester, and which may be said, as it were, to belong to it, are separately enumerated. The rate of increase during the last half-century, 1801—1851, has been, for the whole of England and Wales, 101·04 per cent.; for the London division (which includes the City proper, and parts of Middlesex, Surrey, and Kent), 95·67; for the North-Western division (which includes Cheshire and Lancashire), 98·67; and for the York division (which includes the East, West, and North Ridings, and comprises no fewer than 54 large towns and cities), 109·76 per cent. In Scotland the increase in the population during the same period of fifty years has been 78 per cent., while for Lanarkshire (which includes Lanark, Airdrie, Glasgow, Hamilton, and Rutherglen) the increase has been 260 per cent. From a study of the results of the last census much important information may be obtained.

COROLUS.—With No. 26 will be issued a title and index to the present volume of *The Working Man's Friend*.

JAMES SMITH.—The word felucca is often used by Captain Maryatt and other naval writers. It is the name of a small vessel used in the Mediterranean for coasting voyages. It carries two masts, main, fore and lateen sails, and is propelled by oars when the calms in the Mediterranean render the sails unavailable.

C. G. wishes to be informed which is the best work on Scripture metaphors. The most *complete* is that by Benjamin Keach, but a cheap 8vo. volume on the same subject, called "Brown's Tropology," will be found to answer every purpose.

J. W. SMITH.—"Hungary, its People and its History," will probably be issued in a separate form.

ASPIRANT would like to know what learning is requisite in a timber merchant's office?—Now this is a question which we are hardly able to answer, seeing that we are not aware of the routine in the office of such a merchant. We should imagine, however, that a good knowledge of mensuration and bookkeeping would be indispensable.

J. P.—The cuirass of the ancients was a [illegible] of defensive armour, made of metal, which cover[illegible] the breast and part of the neck; occasionall[illegible] was made to come down over the back as w[illegible] but among that people it consisted simply of thick folds of linen. After having been adopted by the Romans and Grecians, it was laid aside for [illegible] [illegible] andred y[illegible] the fourteenth century. In the English service the cuirass was disused after the reign of George II. till after the battle of Waterloo, at which battle it was worn by the French soldiers. Since 1830 it has formed in the British army part of the defensive armour of the Guards.

J. J.—Province oils are obtained from bones and other animal matter, and explain their fluidity at extremely low temperatures, and are used for lubricating machinery. Most of the ordinary oils become partially concreted at low temperatures. This is due to the separation of the crystalline from the oleine particles. The latter forms the oil in question, the separation being effected by the combined means of cold and pressure.

H. PARKER wants to know the meaning of wattle-gum. It is the gum of the wattle-tree (*acacia mollissima*), a native of Van Diemen's Land. It exudes from the tree during the summer, and soon hardens [illegible] sizes. It is similar to, and is used for the same purposes as the gum-arabic of commerce.

EDWARD EDWARDS.—In Bohemia are made nearly half of the looking-glasses and mirrors used on the continent of Europe.

RICHARD HART.—The invention of clocks has been ascribed to Boethius, A.D. 510, but clocks like those now in use are of a later invention. The first clock on record is the one made at Bologna, in 1356. Henry de Wyck, a German, made clocks about the year 1364, the principle of which is yet preserved. Clocks were probably introduced into England about 1368, by Edward III., and became common in the fourteenth century. Pendulum clocks were invented in 1641, by Richard Harris, of London. They were at first called night-dials, in contradistinction to sun-dials.

HENRY DAVIS, Edinbro'.—The art of embossing paper was invented by the Germans. Subsequent improvements have enabled us to present in relief all the prominent features of a piece of sculpture. The Swiss maps, in which the inequalities of the surface of the country are preserved, are produced by means of embossed paper.

TYRO would have us give an opinion on the effectiveness of "Pulvermacher's Electric Chains" in removing rheumatic pains from the limbs, &c. Now, never having been subject to pains in the limbs, and never having worn an electric chain, or even a galvanic-ring, and having fallen into a somewhat loose way of thinking that there was more of quackery than truth in the professions of the advertising "professors," and being, moreover, by no means well informed as to any actual cure by the use of the electric chain—why, we are scarcely the right person to apply to for information on the subject.

A. S. is anxious to know if *The Working Man's Friend* will publish the history of Poland after that of Hungary. The subject chosen for vol. iv., in which to illustrate "Glimpses of the People of all Nations," will be shortly determined on.

All Communications to be addressed to the Editor at the Office, 335, Strand, London.

ANDERNACH ON THE RHINE.

"THE RHINE! the Rhine! a blessing on the Rhine!" sing the students as they travel, knapsack at back, along the banks of that lordly river. The pride of the great German heart is this single stream; and rightly so, for of all the rivers of this beautiful earth, there are none so beautiful as this. "And oh!" says Longfellow, in his Hyperion—one of the most delightful romances in the English language,—"if I were a German I should be proud of it too. There is hardly a league of its whole course, from its cradle in the snowy Alps to its grave in the sands of Holland, which boasts not its peculiar charms." To describe the Rhine—and as we, the present writer, have never seen the storied river, we quote, from memory, the sentiments, rather than the words, of the transatlantic poet—to describe the Rhine, and describe it well, we should write like a king, with a style flowing royally onwards, without breaks and dashes, like the waters of that regal stream, and antique, quaint, and Gothic times should be reflected in our words as tesselated castle, and crowning vine-

ANDERNACH ON THE LOWER RHINE.

yard, and slippery hill-side, and strange beautiful forms, are reflected through the vapours of morning in its ever-moving current.

Ruins of lordly castles and wide spread domains are reflected, as of old, in the bosom of the silver waters. The everlasting hills, as in the youth-time of creation, still mirror their proud forms in the glancing waves. Onward flows the Rhine, and, like the stream of Time, it flows amid the ruins of the Past. What a picture of human life may be read in those restless waves. Down from the distant Alps, out into the wide world, it bursts away like a youth from the house of its fathers. Broad-breasted and strong, and with an earnest endeavour, like manhood, it makes itself a way through difficult mountain passes and apparently choked-up gorges. And at length, in its old age, with weary steps and slow, it sinks through the sand, which is its grave, and passes onwards to its great eternity, the ocean.

Oh, how many noble thoughts arise when we think of this great river. Thoughts which like the stream flow on unchecked, and beat upon their breasts the legends and the glory of the Past How majestically through the distance and the gloom walk the Great Ones of history, some like the sun, bearing their brightness around them, while others, wrapped in dim memories, shine yet through the mist and the darkness like the stars of night. Through the silence of the Past the spirit hears their slow and solemn footsteps, and they of the Present are edified and chastened by their t[illegible] And yet on earth these men were [illegible] in the outward circumstances of their lives They were in want, and in pain, and familiar with prison bars, and the damp weeping walls of dungeons! even the dungeons beneath the castle keeps which yet, in ruins, look down on the eternal waters of the Rhine But their sufferings, it would seem, were endured but to sanctify their memories, and teach the men of after times As if crosses and trials, and painful disease, had but nerved them for a fiercer conflict and a more glorious victory And, as during the sun's eclipse, we can behold the great stars shining in the heavens, so in this life's eclipse have these men beheld the lights of the great eternity burning bright and solemnly!

The evening bells of Andernach are ringing, even as they rang three hundred years ago, from out the many-pointed steeple of the quaint old church, and the old round tower in the river looks down upon its second self in the clear depths, even as it did when, in the twelfth century, it was newly built and finished by the archbishop Frederick of Cologne It was an old town with old legends pertaining to it even then. Andernach, like most of the Rhenish towns, has its true histories, and its false ones, too, though the last are to the full as interesting as the first. It stands on the left bank of the river, about fourteen miles below Coblentz, and its four thousand inhabitants are esteemed an industrious and trade-loving race. It belongs to the department of the Rhine and Moselle, in the circle of the lower Rhine and the electorate of Cologne: It was formerly an imperial city, and exacted a toll from all vessels passing its walls for the support of its institutions. Andernach was one of the fortresses which Drusus erected to keep the Germans in awe; for then, as now, the wealthy and proud were fearful of the too great influence of free-thought and liberty among the people. In one of the angles of the town-wall there still stands an ancient tower said to have been built at that early age

In 1632, Andernach was besieged by the Swedes. The fight was short but bloody; and in three days the garrison, consisting of about a thousand men, was forced to yield In 1702, it was again taken by the prince of Hesse, and annexed to the kingdom of France. Previous to this time it had been a custom in Andernach to preach a sermon in the market-place on St. Bartholomew's day against the inhabitants of Lintz, a town some sixteen miles further down the Rhine. If on this day any of the inhabitants of the latter town entered Andernach, a riot was the certain consequence, and mischief, if not death, was almost certain to ensue. The cause of the quarrel is said to have been this: In an engagement under the emperor Charles IV, the people of Lantz massacred those of Rheineck and Andernach, except some few whom they sent home minus their ears. So deep was the hatred existing between the inhabitants of the several towns in consequence of this insult that to this day the quarrel has not been altogether made up The trade of Andernach at the present day consists principally of tiles timber, and millstones, which are conveyed to the places of sale in boats upon the river. In the neighbourhood of the town are three medicinal springs, for which it is visited by travellers even now. It is the first town of any importance which the Rhine tourist visits. It is full of historical remains, and abounds—as what ancient town upon the Rhine does not?—with legends and curious histories. The Christ of Andernach, which is said to have descended nightly from its pedestal for the purpose of repairing the houses and mills of the pious, is one of the stock stories which every voyager up the celebrated river is sure to hear With the beautiful episode of the "Richest Prince," from the German of Kerner, we conclude our gossip.

Once, in Andernach's old tower,
Many a German monarch sate—
Of his riches each one vaunting,
And the glories of his state

"Rich," outspoke the lordly Saxon,
"Is that glorious land of mine,
Many a vein among her mountains
Bright with silver ore doth shine."

"On the Rhine is ever plenty,"
Cried the County Palatine,
"In the valleys corn fields waving,
On the hills the noble vine"

"Mighty cities, wealthy convents,"
Louis said, Bavaria's lord,
"These are mine, I fear no rival
While my land can these afford"

Answered Eberhard the Bearded—
Wirtemberg's loved lord was he—
"Small my cities, and my mountains
Void of silver hoards may be,

"Yet one priceless gem his hidden
Deep amid my forests grey,
On the breast of every [illegible]
Fearless, I my [illegible]

Cried Bavarian then, and Saxon,
And the Palsgrave of the Rhine,
"Bearded count! that land is peerless
Which has jewels such as thine!"

How to Make the Best of It.—Robinet, a peasant of Lorraine, after a hard day's work at the next market town, was returning home with his basket in his hand "What a delicious supper shall I have," said he to himself "This piece of kid stewed down, with onions sliced, thickened with meal, and seasoned with my salt and pepper, will make a dish fit for the bishop of the diocese Then I have a good piece of barley loaf at home to finish with How I long to be at it" A noise in the hedge now attracted his notice He spied a squirrel nimbly running round a tree, and [illegible] "Ha!" [illegible] "what a delicate repast my kid's flesh will be to my friends! I'll try if I can get it!" Upon this, he set down his basket in the road, and began to climb up the tree He had half ascended, when casting a look at his basket, he saw a dog with his [illegible] forcing out the piece of kid's flesh He made all possible speed down, but the dog was too quick for him, and ran off with the meat in his mouth Robinet looked after him, "Well, then, I must be content with soup meagre—and no bad thing neither" He travelled on and came to a little public-house by the road side, where an acquaintance of his was sitting, drinking. He invited Robinet to have a draught. Robinet seated himself by his friend, and set his basket on a bench close by him A tame raven, which was kept in the house, came slowly behind him, and stole away the bag in which the meal was tied up, and hopped off with it to his hole Robinet did not perceive the theft until he had got on his way again. He returned to search for his bag, but he could hear no tidings of it "Well," says he, "my soup will be thinner, but I will boil a slice of bread in it, and that will do some good, at least." He went on again, and arrived at a little brook, over which was laid a narrow plank A young woman coming to pass at the same time, Robinet gallantly offered her his hand. As soon as she got to the middle, either through fear or sport she shrieked out, and cried that she was falling Robinet, hastening to support her with his other hand, let his basket drop into the stream. As soon as she was safe over, he jumped in and recovered it, but when he took it out, he perceived that the salt was melted, and the pepper was washed away Nothing was now left but the onions. "Well!" says Robinet, "then I must sup to-night on roasted onions and barley bread Last night I had bread alone. To morrow morning it will not signify what I had." So saying, he trudged on, singing as before.

FIRST AMBITION.

I believe that sooner or later there come to every man dreams of ambition. They may be covered with the sloth of habit, or with a pretence of humility; they may come only in dim, shadowy visions, that feed the eye, like the glories of an ocean sun-rise; but you may be sure that they will come: even before one is aware, the bold, adventurous goddess, whose name is Ambition, and whose dower is Fame, will be toying with the feeble heart. And she pushes her ventures with a bold hand. she makes timidity strong, and weakness valiant.

The way of a man's heart will be foreshadowed by what goodness lies in him—coming from above, and from around, but a way foreshadowed, is not a way made. And the making of a man's way comes only from that quickening of resolve which we call ambition. It is the spur that makes man struggle with destiny, it is heaven's own incentive to make purpose great, and achievement greater.

It would be strange if you, in that cloister-life of a college, did not sometimes feel a dawning of new resolves. They grapple you, indeed, oftener than you dare to speak of. Here you dream first of that very sweet, but very shadowy success, called reputation.

You think of the delight and astonishment it would give your mother and father, and most of all, little Nelly, if you were winning such honours as now escape you. You measure your capacities by those about you, and watch their habit of study, you gaze for half-an-hour together, upon some successful man who has won his prizes, and wonder by what secret action he has done it. And when, in time, you come to be a [illegible] society [illegible]

You spend hours at your theme. You write and re-write, and when it is at length complete, and out of your hands, you are harassed by a thousand doubts. At times, as you recall your hours of toil, you question if so much labour is not upon any other, you feel almost certain of success. You repeat to yourself some passages of special eloquence at most. You fancy the admiration of the professors at meeting with such a wonderful performance. You have a shrewd fear that its superior goodness may awaken the suspicion that some one out of the college—some superior man, may have written it. But this fear dies away.

The eventful day is a great one in your calendar. You hardly sleep the night previous. You tremble a little when it comes, you profess to be very indifferent as to the reading and the prize. close, you even stoop to take up your theme as if you had entirely overlooked the fact that the old professor was at the desk for the express purpose of declaiming the successful names. You listen heavily to the [illegible] and painfully distinct enumeration. You [illegible] shame.

They all pass out with a hush murmur, along the aisles, and through the door-ways. It would be well if there were no disappointments in life more terrible than this. It is consoling, however, to express very deprecating opinions of the faculty in general, and very contemptuous ones of that particular officer who decided upon the merit of the prize themes.

You grow up however, unfortunately, as the college years fly by, into a very exaggerated sense of your own capacities. Even the good old white-haired squire, for whom you had once entertained so much respect, seems to your crazy, classic fancy, a very hum-drum sort of personage. Frank, although as noble a fellow as ever sat a horse, is yet—you cannot help thinking—very ignorant of Euripides, even the English master at Dr. Bidlow's school, you feel sure would baulk at a dozen problems you could give him.

You get an exalted idea of that uncertain quality, which turns the heads of a vast many of your fellows, called—Genius. An odd notion seems to be inherent in the atmosphere of the college chambers, that there is a certain faculty of mind—little developed as would seem in colleges—which accomplishes whatever it chooses without any special painstaking. For a time, you fall yourself into this very [illegible] you cultivate it, after the usual college fashion, by [illegible] a vast deal of strong coffee—by writing a little poor verse in the Byronic temper, and by studying very late at night, with closed blinds.

It costs you, however, more anxiety and hypocrisy than you could possibly have believed.

You will learn at last, oh, ingenius youth, when the autumn has rounded your hopeful summer, if not before, that there is no genius in life like the genius of energy and industry.

You will learn that all the traditions so current of very young men, that certain great characters have wrought their greatness by an inspiration, as it were, grow out of a sad mistake.

And you will further find, when you come to measure yourself with men, that there are no rivals so formidable as those earnest, determined minds, which reckon the value of every [illegible], and which achieve eminence by persistant application.

[illegible] may inflame you at certain periods, and a touch of some great names will flash like a spark into the mine of your purposes, you dream till midnight over books you set up shadows, and chase them down—other shadows, and they fly. Dreaming will never catch them. Nothing makes the "scent be well," in the hunt after distinction, but labour.

And it is a glorious thing, when once you are weary of the dissipation and the ennui of your own aimless thought, to take up some glowing page of an earnest thinker, and read—deep and long, until you feel the metal [illegible] on your brain, and sinking out from [illegible] flashes of ideas that give the mind light and heat. And away you go in the chase of what the soul within is creating on the instant, and you wonder at the fecundity of what seemed so barren, and at the ripeness of what seemed so crude. The glow of toil wakes you to the consciousness of your real capacities, you feel sure that they have taken a new step toward final development. In such mood it is that one feels grateful to the [illegible] that other hours stand like curiosity-making mummies, with no warmth and no vitality. Now they grow into the affections like new found friends, and gain a hold upon the heart and light a fire in the brain, that the years and the mould cannot cover nor quench.

AN EVENING WALK FROM MILE-END TO WHITECHAPEL.

I have set myself a stranger to the neighbourhood, at once one of the best and the worst roads out of London. This day is Saturday, and the time is evening. The first thing that strikes you is the multiplicity of lights, and the next is the world and throng of people passing to and fro upon the footway. Life and activity everywhere, but no apparent bustle or confusion. Everybody intent upon his own particular business, and everybody busy, and, except for an occasional row and the presence of the police, who are pretty numerous here, you would take it to be rather a quiet neighbourhood—considering the crowd.

Starting from the turnpike which ought to be very well known in the city—at the omnibus conductors' cry of "Whitechapel, Mile-gate, Mile-end," by any direction—we will walk leisurely westward for a mile or so, and jot down our conclusions by the way. And the first is, that they must be very hungry people hereabouts, for almost every other shop on the right-hand side of the way sells something to eat. And the next is, that the inhabitants are nomade in their habits, for, on the opposite side, every fourth or fifth shop is a furniture broker's. We look in vain for the same description of shops we notice everywhere else; and, with the exception of the pawnbroker's, of which there are a great number, there are very few retails for the sale of articles of luxury. No jeweller, print-sellers, watch-makers, or booksellers, only a single dealer in second-hand literature, and but one shop where newspapers, cheap books, and popular periodicals [illegible] sale. There was another, but the proprietor did not find the business answer, so he sold off his stock and resumed his old occupation—that of bookbinder *for the trade*.

The neighbourhood teems with grocers', butchers', bakers'-pie, and gun-shops—there are about three of the last every one of the first, however, all in all the windows flaming testimonials announce the *cheapness* of the commodities sale within. Of course, there is no lack of quack [illegible] though very few doctor's shops, but charlatanism confined to one profession, for every grocer sells better articles than his neighbour—and at one large drapery establishment

they regularly sell off a bankrupt stock of I can't tell you how many thousand pounds' value, once a fortnight!—if you may believe their own announcements. Whitechapel is a great place for cheap tailors; and, as you pass along, you cannot but be reminded of the fact by having a bill of Messrs. Levi and Sons, thrust into your hand by a smart little workhouse boy dressed as a page. Here, according to the announcement, you can have a splendid waterproof top coat for 25s., and be completely *suited* for about two guineas and a half.

The streets are full, and so are the shops—the gin-shops

particularly—round the doors of which are gathered little knots of noisy people, whom, as the hour grows later, the policeman endeavours in vain to "move on." Take a peep into one of them, and you will be pained to note how full they are, and to think what vast sums of money are absolutely wasted in the vile compounds distributed to the motley applicants. But a more painful thing is to notice among the crowd of foul-mouthed, blear-eyed, besotted men and women, some half-dozen well-dressed young fellows—scarce eighteen—lolling negligently upon the polished bar-front, smoking short pipes, and talking slang to the girls behind. And even more painful still it is to see how many women are continually passing in and out, lost apparently to every sense of decency and shame. But, perhaps, the most painful thing of all is to glance in at the railed-off portion called the "bottle department," and to watch the entrance of a respectable-looking mechanic and his wife—neat, clean, even pretty, the wife is, and the husband is a treat to look at, in his youth and strength—with their basket and their baby, who go directly to the counter and call for a "quartern of gin." Verily, the woman,

young and pretty as she is, drinks off her portion as if she were used to it; and, as for the husband, he tosses his off with a smack and calls for more. And the "baby must have a little drop," and the glass is lifted up to the infant's mouth without the hesitation of an instant. You may well leave the place in disgust, and ponder what can come of such habits.

Returning to the street—on each side of which, upon the wide open space which lies between the footway and the road, are long rows of stalls closely packed and crowding on each

other, except where the shopkeepers appropriate the space to themselves—you make your way slowly through the increasing mass of pedestrians. Before proceeding, however, pause an instant and look down upon the street. You are dazzled with the flickering light, glittering far away upon the road in long lines of dusky brilliance, gas from the street lamps, gas lamps in countless numbers and variety from the shop windows, and candles and lamps, and a newly introduced adaptation of naphtha flaring and sputtering from every stall in all the crowded way, a most astonishing illumination. These, with the half-yard of flaring light from every butcher's shop, and the dozens of lamps from the public-houses, produce a most strange and remarkable effect.

WHITECHAPEL.—"APPLE

From every turning, right and left—and they are extremely ...erve a continually increasing stream of people, all thronging into the broad highway, till at last th... crowd on the right-hand side of the road is too great to allow of more than a slow walking pace. It is composed principally of mechanics and their wives, clerks wending homewards from the city—for a respectable neighbourhood called Bow lies beyond—a heterogeneous mass of labourers, bricklayers, brewers' dray-

Irish hod-men, cigar-makers—principally young Jews, who all smoke tobacco, in one shape or another—costermongers, and thieves. There are supposed to be two known thieves to every twenty pedestrians in Whitechapel. These with the keepers of the stalls on the road-side and the vehicles in the road itself, form a pretty numerous assemblage; and as the hour grows later, the noise and bustle increase to a rather bewildering extent, and you are puzzled to think where all the people come from.

But the stalls, the stalls are, every one of them, a study. Here are fishes upon boards; rows of second-hand boots and shoes polished up to the last degree of brightness; fruit stalls, ginger-beer stalls, oyster stalls, old iron stalls, greengrocery stalls, and toy stalls, in endless variety, each with its two, three, or four flaring lamps, and amid the more modern of the street stalls, we notice our ever constant and old acquaintance the old Irish apple woman, who sits beside her scanty stock and smokes her pipe, with the one unvarying cry, "Apples a penny a lot—a penny a lot." She is a study that the artist has taken from the life, but in all this long bazaar of cheap commodities, there is only *one* stall for the sale of books, though nearer the city, outside the walls of the workhouse, there are two or three little tables where wretched colourless prints in common yellow frames are exposed for sale. If you're curious in literature, you will linger at the bookstall, but you will not be much edified, for the kind of reading that is patronised hereabouts is entirely of the Jack Sheppard school. An enterprising genius once tried the effect of an al-fresco book auction here. We watched him night after night for about three weeks, as he stood on the top of his little board and offered his treasures to the surrounding crowd in a loud voice;

the fellow was not without wit, but neither wit nor learning could put food upon his table; so, after having tried it as long as he thought there was a chance of earning a crust, he packed up his box one evening and bade the neighbourhood good-bye. He always stood in one place, just opposite the London Hospital, and we have often lingered and listened to him; and once or twice bought, at sixpence a volume, several copies of the old London Magazine. We were sorry when he left, but there was really no love of reading in Whitechapel.

But if literature is not patronised here, gambling is, most extensively, for about every half-dozen yards or so (and opposite the workhouse much more numerously still), are stalls set up for the encouragement of this fashionable vice. They consist of ordinary costermongers' barrows, lighted by a flaring lamp, sometimes two, of naphtha, and the front part filled with nuts. At the back is erected a large board painted in circles with rings or figures, and the manner of playing the game is this: the player hires a feathered needle from a small gun, the impetus being given to the barb by the explosion of a percussion cap, and into whichever ring or number it is forced, he receives a certain quantity of nuts, which are afterwards bought by the vendor at about half-price. At these stalls there is usually a pretty large crowd of youths of both sexes, and the keeper, it would appear, drives a roaring trade—for the love of gambling is inherent in nearly all men. The police never interfere. The pea and thimble game, and the ectotum, are also occasionally seen, but these are not openly allowed. The "gun trick" decidedly draws the greatest number of customers.

Beside these are singers of vulgar ballads, sellers of infamous pamphlets, men who have sham sovereigns to dispose of for a bit of a thousand pounds between two celebrated noblemen, players on the violin, ragged children with lucifer matches or "five onions for a penny," and beggars innumerable—from the respectable sham in a white apron and four clean borrowed babes, to the wretched woman who stands shivering by the way-side and starves—all of whom, except the beggars, draw considerable audiences, and shout out their various pretensions with no lack of lungs. One tall fellow we have known for many years always stands about midway between Whitechapel church and the turnpike. Sometimes he sells wonderful corn-plaister, sometimes cat's-meat for coughs, colds, and cholera, and sometimes a mixture of Paris glue, or a lump of Castile soap, for the cleaning of old chimney-pots or the cleansing of grease spots from old garments. He is quite an original in his way, and it is really a treat to listen to him. In a loud and pompous voice he proclaims the virtues of his nostrums somewhat after this fashion—"Ladies and gentlemen, you have here the most surprising invention for the removal of all spots and stains, from silks, satins, bombazeens, crapes, linens, shawls, gowns, or broadcloth: it will remove all fruit stains, ink stains, grease spots, tar stains, oil stains, blood stains, or [illegible] it will remove all kinds of stains and imperfections upon all kinds of articles, except stains upon the character and imperfections of temper. Come here, my little boy. Observe now, ladies and gentlemen, the large spot of grease upon this lad's collar. You see, I merely damp the mixture, apply it to the stain, give it two or three rubs up and down, wipe it off with a wet flannel, brush the place, and the grease has altogether vanished. There, my little boy, go home and tell your mother you have got a new jacket. Only a penny: only a penny." In this way he will continue to hold forth for five hours together; and a tolerably good living he makes, no doubt. Close by, is a maker of pins, who pursues his calling in a methodical manner, and never stops except to sell a "aporth," but goes on talking and working all the evening; and at a little distance is a stout man propounding riddles to a gaping crowd, or a blind old fellow who plays a set of bells with his hands, and scrapes an old violoncello with the action of his feet.

"Now, then, my customers, here's an infallible remedy for warts, corns, and bunions. The slightest application of this famous salve will remove, in a short space of time, the most inveterate corn with which you may be troubled. It is equally good for hard corns, soft corns, corns between the toes, on the heels, or on the instep, and it has never been known to fail in removing bunions of many years' growth. The late lamented Sir Robert Peel was greatly troubled with corns, for which he had been operated on several times, but, happening to pass through the Tottenham-court road, where I then was, he was induced to purchase a packet, and so immediate was the relief obtained, that he sent his servant the next night with a sovereign, so that he might purchase a stock for his friends. With my salve there is no necessity for cutting and paring—no danger from the incautious use of the razor or penknife before you go out, all that is necessary to do is to wash your feet clean overnight, dry them well, and apply the salve to the place affected. In the morning you will find your corn so much better that you will walk half-a-dozen miles just to prove to yourself that you have none worth speaking of. Only a penny a packet! Now, if I were to set up a handsome shop, and write the word 'chiropodist' over the door, you would come and give me half-a-crown a piece for having your corns pared down close with a lancet, but because I stand in the street, and offer you a certain remedy for a penny, you pass on, and think you will be imposed on. My salve will draw the corns from your feet as surely as the sun draws the plant from the ground, without the slightest pain, confinement, or impediment to business. Only a penny! only a penny!"

WHITECHAPEL.—THE PAVEMENT QUACK.

On any evening in the week, from five o'clock till ten, in [illegible] neighbourhood, you may hear some such [illegible] stairs, it will cost to fetch, or possibly the street-[illegible] packet' is the cry that may hold forth on the virtues of razor-paste, which is warranted infallible for rendering razors and penknives much sharper than any other known application—a fact made apparent by the seller dividing a hair from end to end by one cut of the instrument. Or, perhaps, he may extol the virtues of the famous "Kilenlum" for mending cracked and broken china, glass, or earthenware, illustrating at the same time its efficacy in the most practical of all methods, by first breaking a piece of porcelain, and then

cementing the broken edges together. At another time, perhaps, he sells the "patent plate paste, for restoring the edges of all plated goods, and making copper wares look as bright and new as silver." Or, which is most likely of all, he is pattering in favour of a never-failing remedy for coughs, colds, heats, and fevers, when he holds forth in some such strain as this, though not, perhaps, in such good language:—"Ladies and gentlemen, I offer to your notice a most famous remedy for all manner of coughs, colds, and asthmas. A few of my celebrated cough drops will remove the most inveterate cold in a few hours, and it is equally good for hooping-cough, croup, sore throat, and pains in the limbs. The wonderful Arabian cough-drop is composed entirely of harmless herbs, and such is its efficacy, that I most unhesitatingly and confidently offer it to all who suffer from those disa[illegible] ints. It may be safely administered to the youngest babe, and is equally efficacious in removing the most obstinate lung disease. It warms the stomach, imparts heat and comfort to the nervous system, renders the breathing and expectoration free and easy, and is, in fact, the most simple and unfailing remedy hitherto sold in the public streets. I offer it at the low charge of a penny a box—one penny a box!"

You can scarcely walk through Whitechapel, the Commercial-road, High street, Southwark, Holborn, or the Tottenham-court-road without encountering one or other of these street "patterers." That the articles they sell are next to useless as remedies, need scarcely be said, but, strange as it may appear, there are never wanting people who not only buy, but actually put faith in their nostrums, and will continue to deal with the same men for years. It is a highly curious study to stand and listen for a few minutes to the discourse of these street quacks. They are, as a body, by no means deficient of oratorical powers, and Charles Mathews, in his most favourite parts, does not "patter" faster or produce a greater effect on his audience than does the pavement quack on his. Indeed it has been proved that some of them have moved in very respectable society, and one at least was born a gentleman, and is a classical scholar. How he came to the streets for a living is perhaps useless to speculate, but certain it is, that having once fallen into a wandering kind of life, it is almost impossible to rise from out of it. The pavement quack is by no means an idle man. He is to be found at his post night after night and day after day for months together. The writer has been in the habit for many years of passing to and from a particular street, and ever since he can remember the old fellow who is always to be found there at night telling the same tale over and over again in favour of the "real Jamaky snake-root for toothache and rheumatism."

How do they live? What do they earn? The first question would be difficult to answer, though the miserable lodging-houses in the back streets and courts of St. Giles and Whitechapel might possibly tell of their whereabouts. Of their earnings no one in the reply can be given. "Sometimes," said one man, "I manage to clean a couple a shillings a day, at another time I don't take tenpence. Wet weather ruins us, for people wont stand to listen to you. At such times, I either go round to the public-houses and sell a nigle, or I lays in bed till evening." It must be a miserable life, as, indeed, must be the lives of nearly all those who get their livings in the streets, though possibly the successor of the last century quack doctor is as successful as most of the street "patterers"—for his of them, mechanics and middle class people, confessedly the most easily-imposed-on people in the world. Whether it is possible to lift such folks as the pavement quack—who have many of them a positive love for the life they lead—out of their present miserable condition, is very [illegible]

Side by side with the stalls are numerous vendors of fish, baskets of which, with a lighted candle stuck in the midst, with the grease dropping among them in the most impartial manner, may be seen at almost every step. This is a noisy trade, and "mackerel six a shilling," rings in your ears for half a mile or so.

Near the workhouse, and on the open space by the turnpike, [illegible] nt is commonly exhibited in a show upon wh[illegible] "wonderful spotted Indian from China is to be seen alive, for the small charge of one penny." But, under the walls of the church a strange sight is to be seen. The pavement here is raised some three feet above the roadway, and on the edge are to be discovered, all hours of the day, some dozen bricklayers' labourers waiting to be hired. Summer or winter, rain or sunshine, they are always there, and a very curious chapter in labour's economics their appearance makes. We once heard an omnibus-driver say they must be an orthodox lot, for they were very fond of the establishment.

But we must end our walk, and it is with saddened feelings we retrace our steps. The shops are open still, and full as ever, the streets are crowded and a trifle noisier, the pickpockets ply their busy trade without detection, the ballad-mongers squall their ditties in the same cracked voices; the costermongers bawl still louder than before, the crowd is pouring out and into the Pavilion Theatre, beset by clamorous orange boys and play-bill sellers, the street-fishmongers pursue their noisy trade, the gin-shops are crowded almost to suffocation, the cigar-shops are busy, and the drapers have their hands full, the lights are shining and the rain begins to fall; the beggars get more numerous and the vehicles more rare, the oaths of the women and the execrations of the men are louder and more profane as the liquor begins to operate, the illuminated clock of the church tells us it is almost midnight, and, as we hail a cab to hasten home to supper, the thin shrill voice of a miserable woman, who might once have been innocent and beautiful, comes wafted on the night air, and we recognise the faint echo of a song we heard in a [illegible] a long years ago.

Why, when in Whitechapel on a Saturday night is a painful thing to a thoughtful man

OUR WORKING MEN AND THE MILITIA

Some people are the victims of their fears. They are always in a panic, and therefore cannot do anything, for nothing so entirely unnerves body and mind as fear. Many persons have been frightened to death, and it is the opinion of some that this is to be the end of poor John Bull, and that *France* is to be the bug-bear that will kill him.

From the time of William the Conqueror until now, a period of *eight hundred years*, poor John has been terrified out of his wits by the French, so that to-day he is as much a trembling [illegible] bishops, chancellors, generals, capitalists, &c., have every now and then occupied themselves in dressing up the Gallic cock into a Cock-Lane ghost, and the consternation has been dreadful. We well remember the time when hundreds wished themselves dead and [illegible] graves, that they might avoid being sabred and shot by [illegible] Napoleon!

Napoleon! Bugaboo! What a name! England has often been frightened at it, and now in this very month of March, 1859 [illegible] is most active. It must be minutely flattering [illegible] Napoleon [illegible] that he embodies in himself all the frightful characteristics of his uncle. It is thought by many that the man does not want to be loved, he only desires to be feared, if so, France bristling with bayonets and all England with every man and woman's hand standing on end for fear of him, must be an unutterable gratification to this spring of a Bonaparte. Some ask, "What is there in a name?" But the question, though not easily answered, receives some light if we only look at the alarm of John Bull at the very whisper of [illegible] Napoleon," or cast a momentary glance at the millions which this name has cost him. In 1793, our national debt was [illegible] about 230 millions sterling, but at the peace of 1815 [illegible]s, thus our dread of France and of Napoleon [illegible] a years of hundreds of millions of pound

It has been asserted that in our war against Bonaparte we expended in twelve years 1,459 millions! Here then we have at least a partial answer to the question, "What is there in a name?" We have heard of a pirate whose name was so dreadful that mothers used to repeat it to their children to make them give up crying and go to sleep, but the name of "Napoleon" drives every wink of repose from John Bull, and the large [illegible]

[illegible] before us no correct record of the millions which have from year to year been wheedled out of the purse of

John Bull, while under his periodical paroxysm of French terror. It has been to him a kind of Gallic ague, coming on at almost fixed intervals, or rather brought on him by a race of men who laugh in their sleeves most heartily at his folly. If *Punch* were to take up the subject of John Bull's horror of the French, he might keep the country in a roar of laughter for the next twelve months.

The poor old gentleman is said to be very fond of his money, and utters the most dismal complaints respecting the Chancellor and others, who have been robbing him for the last six or seven hundred years; but still only mention "*France*" and "*Napoleon*," and his pockets and coffers fly open in a minute. Indeed he has been terrified into such madness by these magic names, that he has plunged himself over head and ears in debt, has actually pawned Great Britain and the colonies, and all the fortunes of his children and children's children for several generations to come

It is now known to every designing trafficker in the land, that he can enrich himself at the national expense by only uttering those talismanic words, "*French Invasion*" These cabalistic syllables throw all the tricks and wonders of "*Hocus Pocus*," "*Presto Jack*," "*Fly Jack and be gone*," &c. &c., into the shade. Has a man any gunpowder lying on hand, it is only for him to cry out "*French Invasion*," and John Bull begs him to let him have every grain at any price. And the same may be said of accoutrements, fire-arms, preserved meats (!), steamers, in fact, any article that is good for nothing can obtain a ready sale under a French panic. Should the offspring of the nobility and gentry increase faster than places, pensions, and sinecures, only utter the words "*Napoleon Bonaparte*," and the army and navy find plenty of situations and salaries for them all

Should half-pay prove insufficient to supply the wants of certain profligate officers, so that creditors are rather clamorous, the shout of "*French Invasion*" will soon double their incomes, and enable them to gratify their tastes and appetites at the expense of the country Or if there be a complaint of bad government, or a demand for reform in the state, and the ministry for the time become alarmed for its safety, the cry "*French Invasion*" puts all the people on a new scent, and national and financial reform may go to the dogs. Alas! alas! what good will liberty, the suffrage, the ballot, cheap government, or cheap bread do us, if the French should come over and eat us all up?

When will the working men and tradesmen of this country learn that the war-cry, especially the dread of the Franks, has been one of the stratagems employed by statesmen for keeping up taxation, has put millions into the pockets of certain classes, and kept back the real reform of national abuses for centuries? What large fortunes have "heroes" made out of these French alarms! Were the French as malignant as we say they are, then they have already amply revenged themselves on Old England. Our national debt is a standing scourge which our dread of our neighbours has inflicted on us and on our children, and it is only for Louis Napoleon to keep up the terror of his name and he may justly calculate that our fo[illegible] war expenses will bring us to beggary Poor John is perhaps doomed to die of French fevers or French chills He is literally frightened out of his wits, as to the stake. He is said to be a dear lover of liberty, economical government, and reform, but the paralysis of a French invasion acts worse than an electric shock, so that he drops all from his grasp; and, in his anxiety to escape, allows freedom, reform, trade, economy, and every thing else to lie in the dust How the French must laugh at these tremors of the English braggadocio and his British lion, in one breath singing,

> "Britannia rules the waves,
> For Britons never, never will be slaves,"

and in the next making the land ring with the most frightful cry, that, unless we raise a militia of eighty thousand raw recruits, the crown of Victoria may be on the head of Louis Napoleon in the course of a few days.

When we think of the millions of treasure and blood that our Gallic fears and panics have cost us, what a monument we have of our national folly! Only think what it would have been the glorious result if, instead of thus mistrusting and provoking our neighbours, we had treated them in an open, generous, and friendly way! What if, instead of deeming them savages, we had allowed them to be men. It is a good old saying that "kindness is the key to the human heart," and Solomon has told us that "a soft answer turneth away wrath," and surely it would have been worth while for us to have tried whether justice, patience, humanity, kindness, and benevolence, would not have worked as well as powder and shot. Killing Frenchmen and Englishmen without mercy, and thus beggaring ourselves, has done no one any good. We have lost, and the French have lost, incalculably by this folly. If, instead of being enemies to each other, these countries, linked together by a narrow channel, had been friends, and sought each other's welfare, our mutual prosperity and greatness would have surpassed anything that the most sanguine mind can imagine. It is, therefore, high time that, as a *brave* people, we cease to fear the French, that, as a *generous* people, we treat them with confidence; and that, as a *prudent* people, we do nothing to irritate and provoke them. Having tried everything but kindness, it will be wise for the next few years to see what the pacific and fraternal spirit of christianity can do. This will cost us nothing, and will vastly improve our tempers and characters.

A war with France, though attended with victory on our part, will leave behind a debt almost equal to a French invasion. And nothing will be more likely to produce hostilities than this calling out of the militia, so that every one would suffer by it. The French would be scourged sadly by such an occurrence. Their trade would be injured, their debt increased, and thousands of useful citizens laid dead on the field England also would be a tremendous loser by such an event War with France offers us nothing but a dead lo every possible way. Why, then, do anything to provoke it and, consequently, why call out the militia?

Our WORKING MEN must set their faces against this national folly, knowing that they themselves will be the greatest sufferers. The expense will fall most heavily on them The injury to trade will chiefly rob them of work, and therefore lower wages. They will have to be dragged from home for a certain portion of the year, and be doomed to live on the paltry wages that the state gives its soldiers In this military bondage they will be ruled over by the iron rod of martial despots All the corruption of the barracks will pollute their morals, and hundreds will return from duty ruined for life. Let, then, this mad proposal receive from our operatives, labourers, and their wives and parents, and, indeed, from all humane citizens, that condemnation which it deserves, and our rulers will hesitate to insult England and irritate the French by such folly and wickedness.

From a pamphlet which has lately appeared on this important subject, we extract a few hints, which the WORKING MEN of Great Britain will do well to take to heart. The introduction of a militia bill, it emphatically declares, "puts the country on a war-footing in a time of peace. It has a direct tendency to spread among the population a pernicious and demoralising war-spirit. Surely no man can have watched the improved tone of feeling which has been growing in this country towards other nations without pleasure and satisfaction. But should this system come into operation, it will revive the old spirit, so utterly at variance with the Christian temper—the spirit which breathes threatening and slaughter against our neighbours, which scorns the quiet pursuits of industry and the arts of peace, and covets martial distinction, though purchased at the cost of human blood. It will be found extremely oppressive to those who come under its operation. It proposes to lay its hand upon seventy thousand young men, between the ages of twenty and twenty-three, to take them away from their occupations and homes for twenty-eight days, and subject them to military discipline, without the possibility of procuring a substitute. Just at the time when they are embarking in life, does this proposed law step in, and insist upon their giving up their time, their labours, and their prospects for *a remuneration of one shilling per day!* It will prevent them from obtaining many situations, which might otherwise be open to them, and lead to their losing those they hold; for who will like to employ a person liable, at a moment's notice, to be called away from his business, for 14 or 28 days, to go playing at soldiers? It will exert a most deleterious influence on public morality. Let parents who have sons of that age ponder well what it involves At a time when they are most open to temptation,

they are drawn away from parental superintendence and the hallowed influences of home, and compelled to associate with a promiscuous crowd of men of every character, among whom beyond all doubt will be found many of the lowest and most immoral of the population. It is full of ominous indications that something more is meant than meets the ear,—it sets at utter defiance the rights of conscience."

What then remains? Working men of Great Britain, If you would not "have these evils inflicted, you must be up and stirring. You must hold your meetings, and pour in your petitions at once. You must address individually your members of parliament, and tell them that there must be no mistake in this matter, that he who is not with you is against you, and that the man who, by speech or vote, supports the war measures of the government, must henceforth look for no aid from you at the hustings and the polling-booth. Act then at once, and show to your rulers, by peaceful but vigorous and united demonstration, that a system so utterly at variance with the spirit of the Gospel, and so adverse to your dearest rights and interests, shall never, with your consent, be resuscitated in England."

LECTURES TO WORKING MEN.

ON IRON.

On Monday evening, March 15th, a lecture on iron was delivered by Professor Percy, M.D. at the Museum of Practical Geology, Jermyn-street. The lecturer commenced by stating that although he had no brilliant showy specimens to exhibit to his audience, yet the rude specimens of iron ores before him formed one of the chief sources of the wealth of this country, and were of far more value than all the gold of California and Australia. Dr. Percy then proceeded to state that iron is occasionally found in the metallic state, in which case it is found with other metals as an alloy, meteoric iron is an example of this kind, which has been found in masses of many tons' weight. The source of this meteoric ore are unacquainted with. Pure iron is found only in the laboratory of the chemist. In ordinary language we apply the term pure iron to wrought or malleable iron. As regards its physical qualities, iron possesses great malleability, and may therefore be rolled into thin sheets. The specimens of *paper iron*, from Austria, shown at the Exhibition, carried off a council medal. It is very ductile, and can therefore be drawn out into fine. Iron also possesses great tenacity, and a small iron wire is capable of sustaining a great weight. It is about eight times heavier than water.

The various kinds of iron are, chemically speaking, compounds of iron with carbon or pure charcoal, thus wrought-iron contains about a quarter per cent. of carbon, and if deprived of this carbon it becomes converted into what is termed burnt iron; if the quantity of carbon be increased to a half per cent., it becomes a kind of soft steel, whilst above that, up to two per cent., it forms the various qualities of steel. If the proportion of carbon be still further increased, as from two to four per cent., cast-iron is formed. The presence of carbon cannot be detected by the eye any more than the separate presence of copper or zinc in brass, because there is a chemical combination; but in the case of cast-iron, portions of carbon may often be seen by the aid of the microscope.

The ores of iron are for the most part compounds of that metal with oxygen, as illustrated in the following diagram —

ORES OF IRON.

Magnetic Iron Ore.

Iron	72·4
Oxygen	27·6

Specular Iron Ore (protoxide)

Iron	70 0
Oxygen	30 0

Brown Iron Ore (hydrous oxide).

Iron	60 0
Oxygen	26 0
Water	14 0
	100 0

Sparry Iron Ore (carbonate of iron).

Protoxide of Iron	62 0
Carbonic Acid	38 0
	100 0

Oxygen, which is one of the constituents of the atmosphere, forming the vital part of the air we breathe, is readily attracted by iron, and the union produces an oxide of iron, or rust. If iron be exposed to the action of *dry* oxygen, the effect takes place, and it remains bright for an indefinite period, but if moisture be admitted, then the absorption of oxygen or oxidation is readily effected, which goes on at an increasing rate. If iron be heated, it also takes oxygen readily, as is shown by the iron scales of the smith's forge. Now the great object of all iron-smelting processes is to get rid of this oxygen, which in the ores of iron is combined with the metal. To effect this, blast furnaces of various forms are used. The theory of the smelting process is as follows: A layer of charcoal, coke, or coal, is placed in a furnace heated red hot, above the charcoal is a layer of iron ore, air is admitted by means of a bellows or blast, the oxygen of the air combines with a portion of the charcoal to form carbonic acid; this carbonic acid unites with a further portion of carbon, forming carbonic oxide—the true reducing agent—which, at the high temperature of the furnace, acts on the iron ore, and by combining with the oxygen of the latter, reduces it to the metallic state, whilst the carbonic acid formed by the union of the oxygen of the ore with the carbonic oxide, passes off into the air at the top of the furnace. By the addition of limestone, the iron assumes a liquid form, and is separated from the earthy particles (with which it is more or less associated) which float on its surface and is called the *slag*, this limestone is called *flux* from its property of enabling the melted iron to flow or become fluid.

The lecturer then proceeded to describe some of the methods adopted in practice to separate the iron from its ores. In the ancient British iron furnaces, as also in those of Africa, India, and the Pyrenees at the present day, the iron was converted direct from the ore into the state of wrought-iron. Dr. Percy then described the Catalan blast furnace as adopted in the Pyrenees, in which the blast is obtained by the pressure exerted by the fall of a column of water, and that of India, where a goat-skin bellows worked by manual labour, day and night unremittingly, is the source of the supply of air to the furnace. As the blast furnace of our own country and of our own day is the most interesting, we will now give the lecturer's description of it.

Blast furnaces are from 40 to 50 feet high, built of stone or of brick, and lined internally with fire brick and cement, capable of standing a high heat, they are about 11 feet wide (internal) at the *hearth*, the lower part of the furnace, and about 15 feet wide at the *boshes*. Into the top of these furnaces, barrowsful of iron ore, limestone, and fuel, in weighed proportions, are thrown, the furnaces being usually built against the side of a hill so that ready access is obtained to the upper part. The ore is first roasted or calcined, by being placed between layers of coal which are set on fire, by this means the ore is brought into a state to be more readily acted on in the furnace. The proportions are about 30 cwt. of calcined ore and 9 cwt. of limestone, and from this is produced 15 cwt. of pig-iron. These charges of ore, limestone, and fuel, are kept on three or four times in an hour, day and night uninterruptedly. Near the lower part of the furnace are three openings, one at each side, and one at the back, through each of which a constant and powerful current of air is forced by a powerful engine, this is called the blast. The blast of air is conveyed into the furnace through tubes called *tuyeres*, resembling the nose of a bellows. These *tuyeres* are connected with a large reservoir, such as an iron cylinder, filled with compressed air, driven into it by a powerful steam-engine acting on the principle of a force-pump. This reservoir is often capable of containing 2,000 cubical feet of air. Were it not for this reservoir or blast regulator, the air, if forced by the engine at once into

the furnace, would produce an intermitting irregular blast, by which the operation of the furnace would be much impeded. In some furnaces *cold* blast is used, and in others hot blast, in the former case the air is used of the temperature of the surrounding atmosphere; in the case of the hot blast the air is made to traverse a series of pipes or tubes placed in a furnace, by which means it becomes heated to 600 deg. Fahrenheit before it enters the furnace.

The melted iron, which is obtained by the aid of heat kept up by this powerful blast, is allowed to accumulate at the lower part of the hearth, whence it is *tapped* or drawn off twelve hours, through a small hole at the bottom of the furnace, which is filled with clay after each tapping, and is broken open when the next tapping is necessary. The liquid metal is run out into moulds of sand made on the ground in front of the furnace, and the masses of iron thus obtained are termed "pigs" and are in this state sent into the market.

Through another opening, higher up than the one just alluded to, the *scoria* (slag), or melted impurities contained in the ore, the flux, and the fuel, flow off into cast-iron boxes placed to receive them. Some idea of the quantity of iron thus made may be ascertained from the fact that one furnace alone has yielded, for 52 consecutive weeks, 209 tons of cast-iron per week.

Such is the process adopted for the manufacture of *cast*-iron. Reference was then made by the lecturer to the discovery of this manufacture. It has already been stated that in the ancient furnaces wrought-iron was produced, and we have no precise information as to the time cast-iron was first made in this country. In the manufacture of cast-iron, charcoal was the only fuel formerly employed, and we are deeply indebted to Dudley, who, in the reign of Charles the First, discovered the method of using coal as a substitute for charcoal - a discovery of paramount importance to this country, especially as the supply of wood requisite for the manufacture of the charcoal was fast diminishing. Dudley, like many other men who have benefited the world by their discoveries, had many difficulties and prejudices to overcome in the introduction of this great improvement. Many persons endeavoured to get his secret from him, and it is stated that even Cromwell employed an agent in this underhand affair. Dudley, however, was too wide awake for all of his opponents, and in 1665 he obtained his patent. At that time cast-iron made with charcoal cost from £7 to £10 of the money of that period, whereas Dudley was able to sell his coal-made iron at £4 per ton, although he made but *three tons a week*. Since that period the manufacture of cast-iron has made rapid progress, and become a chief source of the wealth and naval power of the country.*

When Dudley began using coal in the manufacture of iron, the great landed proprietors of the day used all their influence to oppose the introduction of the new process. They wished to keep up the *high price of wood*, regardless of the influence of such a proceeding on the welfare of the community at large. Had these attempts been allowed to prevail, the consequences would have been highly detrimental to the manufacturers of the country.†

* We append the following statistical account of the number of furnaces in blast, and the number of tons of iron produced by the respective periods:

In the year	1615	300 furnaces	produced	180,000 tons of iron
—	1710	59	—	1,500 —
—	1806	121	—	250,000 —
	1827	284		
—	1839	511	—	

of the produce of the year 1849

In France
The for
4,570,000 acres—of which [illegible] are [illegible] and lower [illegible] which [illegible] of iron [illegible] and [illegible] would be possible [illegible] [illegible] [illegible]

Seen through gold-bound glasses, however, Adam appeared no more the worthless wretch Matilda formerly considered him. As the youngest of unmarried daughters, in whose maiden footsteps she was following fast, the proud Matilda was pretty well qualified to judge of Adam's newly-discovered merits. She judged indeed, and when the stupid fellow, believing every woman true, once more offered her his hand, she graciously accepted it. Adam almost burst with joy. He firmly believed himself the most fortunate fellow in the world, and would not have exchanged his happiness with any individual alive.

But while Adam was so happy, somebody was very miserable. To every laugh of his, somebody echoed a sigh. While the balance of his happiness was full, that of another kicked the beam.

That other was his foster sister—the fair Rose—who had loved him ever, from his youth upward, with an unaltered affection. She was a gentle, winning creature, and it was a wonder that Adam had never fallen in love with her. She was fairer than Matilda Moore, and it must have been a silly pride which caused Adam to prefer the *position* of the latter to the *character* of Rose.

Adam, in effect, was blind. He did not appreciate Rose. He did not understand her. Could he have known how well she loved him, the startling truth might have brought him to his senses. But he was like a bat, he could not see the light. Often, after his return, he discovered tears in the soft eyes of Rose.

"My dear sister," he would say, "what is the matter?" kissing her fondly, and playfully blowing the tears off from her long eyelashes—"what is the matter?"

Fool, not to see! fool, not to discover, in her evasive answers, the grief which was breaking her heart. Blind, indeed! he appeared to see nothing except the charms of Matilda and the glitter of his gold, which he kept locked up in a stout oaken chest, previously to investing it in a farm for "self and wife."

Now Adam had many old friends, who warned him against Matilda, and whose wise counsel was despised. His father and elder brother begged him to make a different choice, endeavouring to convince him that it was only his money that Matilda loved.

"Do you think I'm a baby?" cried Adam, once in Rose's presence. "Can I read a woman's heart. If Matilda didn't love me, do you suppose I would be fool enough not to secure her? She'd have me if I hadn't a penny in the world."

"She wouldn't look at you!" exclaimed his father.

Upon which, both left the house in different directions, Rose, trembling and weeping, remained alone.

It is a rather singular coincidence, that on the very next morning, Adam opened his eyes considerably wider than usual, on first getting up, at the strange, startling sight, which made him tremble and grow faint. The lid of the oak chest was lifted. The gold was gone! and in its place lay his bowie knife and revolver, which he always placed under his pillow on going to bed, as security against thieves.

Speechless, and pale as death, Adam stood gazing with a look of despair and rage at the rifled chest. It was evident that the robbers, on entering the room, had first taken possession of his weapons, and finally left them in place of the gold. At all events, the gold was gone—Adam was penniless. The fruit of many months of painful toil had vanished in a night-time. The truth was too terrible to be realised—the misfortune too great to bear.

In a hoarse voice, Adam called his father, and communicated to him the fearful intelligence. It is hard to say which was the most angry of the two. They discovered how the robber might have entered and left the house, and they raised the alarm at once. In an hour all Muddybrook rang with the report of the robbery, and officers were in pursuit of the thieves.

In vain!

No gold was to be recovered—no thieves were caught.

The fever of excitement into which Adam was thrown by his misfortune caused him a fit of sickness. For a week he lay groaning on a bed of pain and despair. All this time his affianced—the false Matilda never visited him—but Rose, the faithful, devoted Rose, was always by his side, to soothe and console him.

Immediately on his recovery, Adam betook himself to Mr Moore's house. Still unwilling to believe Matilda faithless, he went to pour out his sorrow in her sympathising ear, and to assure her of his much-injured love.

Matilda forbidding gaoler could heal his heart: she regarded him as if he had been some one else—a porter, whom she had seen somewhere, and of whom she retained some very disagreeable recollections. Adam's eyes were now opened to his folly, and he reproached her bitterly.

"Not another word, sir!" cried Matilda, haughtily interrupting his complaint. "If you have been deceived in me—*I* have been deceived in *you*. It is best for us never to meet again.—Good-bye."

Adam staggered home. He threw himself groaning upon a seat. Poor Rose—scarcely less afflicted than himself—knelt down by his side, and begged him to tell "his sister" what had happened.

Adam pressed her head to his bosom, and his tears fell on her glossy tresses, while to that one sympathising heart he offered his own, and laid bare all his grief.

Meantime poor Rose wept, but she could not speak; and, withdrawing from his embrace, she hastened to her chamber.

That night Adam slept soundly, and awoke in the morning, more nearly reconciled to his lot than he had been before. He rubbed his eyes, smiled, as, recalling a dream he had had, he made a resolution to regret his gold no more, to forget the false Matilda—and, moreover, to be a man again.

He rubbed his eyes, we say, but as soon as he got them fairly open, the smile vanished from his lips, and he started [illegible] on the lid of his chest. Eager [illegible] he seized it—he pressed it to his [illegible]—and his countenance gleamed with joy, for that his gold was in his grasp!

And pinned to the precious bag was a slip of paper, on which, in a well known hand, were written the following words:

"Forgive me, dear Adam—my dear brother! I am the cause of your sorrow—I took the gold. I thought I was acting solely for your good. Now if you wish to marry Matilda, you can, for she will accept you. I know I have acted unwisely—wrongly—but forgive your poor sister, whom you will never see again!"

Adam was too much overjoyed to read more than half of the note.

"Forgive you—you darling!" he cried, almost out of his senses. "Forgive you—my guardian angel! Yes, and bless you too!" he muttered, rushing from his room. "Where's Rose?" he demanded of the housekeeper.

Rose had not yet appeared. Burning with impatience, Adam sent the old lady to call her. In a minute she came back, pale and with consternation, declared that Rose was gone.

Adam, recovering from the shock this intelligence occasioned him, flew back to his room, locked up the gold, and set out immediately in pursuit of Rose, who, he felt sure, had taken refuge with some of the friends of the family in Maplegrove.

On the way, also, Adam had plenty of time to reflect; and, on arriving at Maplegrove, his mind was fairly made up with regard to what he ought to do.

Rose's friends could not deny that she had that day arrived at their house. Adam demanded to see her, and his request was not to be refused.

And poor Rose, with swollen eyes, and a face that was deadly pale, at length made her appearance, trembling with apprehension.

"Say you are not angry with me!" she faltered, raising her eyes timidly to Ad[illegible].

"Angry with you! my good angel! No, indeed!" cried Adam, folding her in his arms.—"And yet it is my duty to make you a prisoner—now don't tremble!—a prisoner for life, I mean. Not for stealing my gold—you rogue!—but for stealing your stupid Adam's heart!"

And Rose—poor, silly, blushing Rose—yielded herself without a struggle, and Adam took her home in triumph.

And not long after he took her to another home, purchased with his gold, and prepared for the dearest little wife in the world a happy home, which was the envy of all Muddybrook, and an eye-sore to Miss Matilda Moore for ever and ever.

MISCELLANEA.

SLEEP.—No person of active mind should try to prevent sleep, which, in such persons, only comes when rest is indispensable to the continuance of health. In fact, sleep once in the twenty-four hours is as essential to the existence of the mammalia as the momentary respiration of fresh air. The most unfavourable conditions for sleep cannot prevent its approach. Coachmen slumber on their coaches, and couriers on their horses, whilst soldiers fall asleep on the field of battle, amidst all the noise of artillery and the tumult of war. During the retreat of Sir John Moore, several of the British soldiers were reported to have fallen asleep upon the march, and yet they continued walking onwards. The most violent passions and excitement of mind cannot preserve even powerful minds from sleep; thus Alexander the Great slept on the field of Arbela, and Napoleon upon that of Austerlitz. Even stripes and torture cannot keep off sleep, as criminals have been known to slumber on the rack. Noises which serve at first to dr[ive] sleep, soon become indispensable to its existence, thus a stage coach stopping to change horses, wakes all th[e] The proprietor of an iron forge, who[se] close to the din of hammers, [and] blast furnaces, would awake if there was any interruption to them during the night, and a sick miller, who had his mill stopped on that account, passed sleepless nights until the mill resumed its usual noise. Homer, in the Iliad, elegantly repr[esents] sleep as overcoming all men and even the gods, excepting Jupiter alone. The length of time passed in sleep is not the same for all men, it varies in different individuals and at different ages, but nothing can be determined, from the time past in sleep, relative to the strength or energy of the functions of the body or mind. From six to nine hours is the average proportion; yet the Roman Emperor, Caligula, slept only three hours, Frederick of Prussia and Dr John Hunter consumed only four or five hours in repose. Napoleon slept during eight. A rich and lazy citizen will slumber from ten to twelve hours daily. It is during infancy that sleep is longest and most profound. Women also sleep longer than men, and young men longer than old. Sleep is driven away during convalescence, after a long sickness, by a continued fasting and the abuse of coffee. The sleepless nights of old age are almost proverbial. It would appear that carnivorous animals sleep in general longer than the herbivorous, as the superior activity of the muscles and senses of the former seem more especially to require repair. A witty writer says women require more sleep than men, and farmers less than those engaged in almost any other occupation. Editors, reporters, and doctors, need no sleep at all. Lawyers can sleep as much as they please, and thus keep out of mischief. Clergymen can sleep twelve hours out of twenty-four, and put their parishioners to sleep once a week!

"A BAD EXCUSE BETTER THAN NONE"—The following are a few of the stereotyped excuses for not attending public worship:—Overslept myself, and could not dress in time. Too hot, too cold, too windy, too wet, too damp, too sunny, too cloudy. Don't feel disposed. No other time to myself. Look over my [illegible] Put my pence to right. Letters to write to my friends. Taken a dose of physic. Been bled this morning. Mean to walk to the bridge. Going to take a ride. Tied to the shop six days in the week. No fresh air but on a Sunday. Can't breathe in the church, always so full. Feel a little feverish. Feel a little chilly. Feel very lazy. Expect company to dinner.

CURIOUS CIRCUMSTANCE.—It is something singular that Washington drew his *last* breath in the *last* hour of the *last* day of the *last* week of the *last* month of the *last* year of the *last* century. He died on Saturday night, twelve o'clock, December 31, 1799.

'IN VINO VERITAS.'—A clergyman and a magistrate residing not very far from the shores of the Solway, were recently returning home one evening, after having worshipped largely at the shrine of Bacchus. His reverence's onward course was, as may be imagined, somewhat tortuous, but he was greatly assisted by the considerate endeavours of one of his parishioners. After a long silence the following dialogue ensued:—Clergyman. You're a very decent fellow, George, bu[t]

Parishioner. Indeed, Mr — I'm sor[ry] to hear you say so; pray what is [the] don't come to church on a Sunday quite so regularly as you should do, George. Parishioner. Well perhaps not; but then, [Mr] — — I'd church rates and Easter dues the very da[y] they become due. Clergyman. Well well, George you do—you do. And, after all, the—*the principal pa[rt] of the business*.

MEDICAL USES OF SALT.—The fo[l]lowing remedies are not intended to supersede medical advice, but may be used till [a]ch, a te[r] day, is a certain cure. In the violent internal aching termed cholic, add a handful of salt to a pint of cold water, drink it, and go to bed. It is one of the [fi]rst be[st] lone on the first symptoms of dead from a heavy fall, &c. In an apoplectic fit, no time should be lost in put[ting] salt and water down the throat, if sufficient sensibility remain to allow swallowing, if not, the head must be sponged with cold water until the senses return, when salt and water will completely restore the patient from the lethargy. In the fit the feet should be placed in warm water, with mustard added, and the legs briskly rubbed, all bandages removed from the neck, &c, and a cool apartment procured, if possible. In many cases of severe bleeding [from] the lungs, when other remedies fa[il] Dr. Rush found two teaspoonfuls of salt completely stay the flow of blood. In cases of bite from a mad dog, wash the part with strong brine for an hour, and bind on some salt with a rag. This pre[vents] all consequences, and cures. In toothache, warm salt and water held to the part, and renewed two or three times, will relieve in most cases. In scorbutic habits, use salt plentifully, and vegetable diet, if the gums be affected, wash the mouth with brine, if the teeth be covered with tartar, brush them twice a day with salt and water. In swelled neck wash the part with brine, and drink it also twice a day until cured. Salt will expel worms, if used in the food in moderate degree, and aids digestion, but salt meat is injurious, if much used.

ANSWERS TO CORRESPONDENTS.

ARTHUR.—The native tribes of North America are called *Indians* from the simple fact that when Columbus discovered the Islands of America they were called *West* Indies, in contradistinction to the *East* Indies.

JAMES ASHLEY, *sen.*, St Helen's.—The author of the "Wonders of the Heavens" thinks that the work referred to is one written by Rev E. Henderson LL D. In the appendix to that volume an estimate of the relative distances of the planets is given, but many such have appeared. The delay in this reply has arisen from the fact that Mr A was written to by post but the letter has been returned from the Dead-letter Office, the address being insufficient.

J. L.—In the reign of Queen Margaret of Scotland, the Parliament passed an act that any maiden lady, of high or low degree, should have the liberty to choose for a husband the man on whom she set her fancy. If a man refused to marry her, he was heavily fined, according to the value of his worldly possessions. The only ground of exemption was previous betrothal.

J. H. P. and several other correspondents wish us to recommend particular books, with the publishers' names, prices, &c. Were we to do this we should be liable to the adv[antage] of undue partiality.

[The] apparatus for photography may be obtained of almost any philosophical instrument maker, the prices vary from £1 10s upwards.

ROSE PERRY.—The true test of love is, the [de]sire to seek the happiness [of] I this feeling, and the true happi[ness] [ex]actly.

C. H. and two other correspondents.—*Coins*.—Sir H. Da[vy] [in] ode of suicide ladies is to wear thick boots, and lace with a wrench and rope. By this means they may kill themselves without being suspe[cted] brought to London in 1611. [No]thing more of the science of geology, and almost doubts the truth many things advanced in favour of it. Let him learn, in the words of a learned writer, that gre[at] dead, but the[y] had that upon their stone tablets we may read, we will but observe, the story of the earth [and] its, the history of creations which [ex]isted during those vast ages when the earth was undergoing the changes necessary to the realization of that garden in which was created reasoning man.

R. ADAMS has mistaken us. We did not say that a lad could be a journeyman before he was twenty-one years of age, but that a knowledge of most trades might be acquired in two or three years. [A] Popular Education will enable a careful student of its pages thoroughly to understand and master the various objects you have named.

JOSEPH K. wishes to know how a pencil is to be held while drawing.—It must be held in the possible direction, according to the nature of the object.

MARIANNE should be more tolerant in her strictures. Let her think over the following anecdote.—"Two cardinals found fault with Raphael for having, in one of his pictures, given to St Peter and St. Paul 'Gentlemen,' replied the artist, 'I pleased with the criticism; 'don't be surprised; I print that just as they look in heaven. They are blushing with shame to see the church below so badly governed.'"

THE

WORKING MAN'S FRIEND

AND

FAMILY INSTRUCTOR.

VOLUME THE SECOND—NEW SERIES.

"Uncultivated, wild, and rankly filled
With weeds obnoxious to the growth of good
Are countless minds among the multitude,
Who weave, and mine, and by whom earth is tilled.
Yea, further up, in classes nobly skilled
In arts mechanic rarely understood,
Are those high aims that warm a patriot's blood,
Or thoughts, with which full many a harp has thrilled
Let printed pages, like to winged seeds,
Go forth and light upon such barren soil,
And bear a frontage of ennobling deeds
To elevate the million sons of toil,
Till knowledge blessing them, exclaims at last,
'Behold a garden, where there grew but weeds!'"

1852

TO OUR READERS.

THE completion of another Volume of the WORKING MAN'S FRIEND AND FAMILY INSTRUCTOR enables us to address a few words to our readers. When, nearly three years ago, we issued our first Number, we could scarcely anticipate, or dare to hope, for the great success which attended our experiment. Before then, no publication had appeared which professed to devote itself entirely to the working classes; and, though several have since followed, in some sort, in the path we led, we are proud to say that THE WORKING MAN'S FRIEND AND FAMILY INSTRUCTOR still stands alone in the peculiar character which we ventured to give it. Times have changed, indeed, since the "Penny Magazine, of the Society for the Diffusion of Useful Knowledge," first engaged public attention. The readers of 1852 are a different class from those of 1832, and the twenty years which have elapsed have been fraught with reforms as important in the moral and educational, as in the social and political world. Thus it is that literature of a higher and more enduring character than was common among us is demanded by the readers and thinkers of the present day; thus it is that from mine and forge, and factory and warehouse, and humble cot and quiet fireside, a cry has gone forth for "More light!" Thus it is that that cry has reached up, through all classes of society, even to the throne itself, and that the Working Men of 1852 have won from the high and noble a consideration and respect of which their fathers had no thought or knowledge. Shall we not profit by a state of things so promising—a state of things brought about by no violence or loud talking, no brawling in the market-place or complaining in the streets—but by virtue of true courage, reason, knowledge, and self-respect? The first step in compelling others to respect us, is to respect ourselves.

To assist in promoting that high and self-dependent character, which we believe to be the peculiar characteristic of the working classes of Great Britain, has been our constant and most earnest endeavour; and, as the formation of every man's mind is, more or less, in his own hands, we have been careful that nothing should appear in these pages but that which should possess an upward and improving tendency. In our first Number we promised that History and Biography, Social Economy, and Moral Teaching should form the leading features of our Magazine; and we considered, that in assuming such responsible titles as Friend and Instructor, we in no wise went beyond the limits of strict propriety, because we were assured of the goodness of our cause and the sincerity of our intentions. Having been all our life among the people, shoulder to shoulder with the living crowd, we believed that we understood their peculiar wants, feelings,—aye, and prejudices too. The success which has attended our efforts has fully justified that belief. The path in which we set out we still pursue; and, if we may dare to make promises for the future, we doubt not but that the next Volume of this Magazine will be as worthy the support of the million as those which have preceded it. To make it more so, and to introduce various new features in its pages, will demand care and liberal expenditure. We promise that it shall have both; and that our literary staff shall be enlarged, and, in return, we ask of our readers—the working men and working women of Great Britain—that they render their own Magazine a commercially safe speculation by their earnest support and cordial recommendation. Let every individual subscriber pledge himself to obtain one other, and the WORKING MAN'S FRIEND AND FAMILY INSTRUCTOR will be at once the best read and most popular publication in the kingdom.

La Belle Savage Yard, Ludgate Hill, September 15, 1852.

EGYPT: ITS EDIFICES AND ITS PEOPLE.

THE CITY OF ALEXANDRIA.

"EGYPT," says the justly celebrated John Foster, "has monuments of antiquity surpassing all others on the globe. History cannot tell when the most stupendous of them was constructed, and it would be no improbable prophecy that they are destined to remain to the end of time. Those enormous constructions—assuming to rank with nature's ancient works on the planet, and raised, as if to defy the powers of man and the elements and time to demolish them, by a generation that retired into the impenetrable darkness of antiquity when their work was done—stand on the surface in solemn relation to the subterraneous mansions of death A shade of mystery rests on the whole economy to which all these objects belonged. Add to this our associations with the region from those memorable transactions and phenomena recorded in its sacred history, by which the imagination has been, so to speak, permanently located in it, as a field crowded with primeval interests and wonders." Such, then, is the country on the contemplation of which we now enter, yielding us it does a rich and abundant reward to the most careful and persevering researches.

MODERN ALEXANDRIA.

On landing at Alexandria, the scene is unique to a European eye. The steamer is surrounded by fifty or a hundred boats, containing a motley collection of dark-skinned, turbaned, half-naked, and half-savage looking beings, each one shouting and gesticulating with all his might, and calling aloud to any one and every one in a medley of tongues, partly in English, a little in French, with a few words of Italian or German, or something else. To a spectator unacquainted with the habits of these people, it would appear that they were quarrelling very furiously, and liable at any moment to come to blows, so eager are they, so active and energetic in endeavouring to recommend their boats, and so full of liveliness and noisy good humour in pushing and jumping about and getting hold of the luggage of travellers. Such a Babel of tongues, such a chaos of luggage strewed over the steamer's deck, such fuming and fretting, such running hither and thither, hunting up stray carpet-bags or small parcels, calling out almost in frenzy for a missing trunk or portmanteau, rousing the ire of the French sailors and servants, seizing hold of some bare-legged Arab who is making off with part of the luggage, and at last giving up all in desperation, determined to take one's chance and let bags and baggage go as they may—such an odd scene of confusion can very rarely be witnessed After a while, however, a way is made through the noisy crowd, and depositing themselves in the midst of a boat, the travellers are rowed along at a slow pace, through the merchant vessels, a large number of which are lying at anchor in the harbour; and in fifteen minutes' time they are in front of a dirty white-coloured building termed the Custom-house. Their luggage is placed in very large baskets, and these put on the heads of women, who act as porters in Alexandria, and indeed throughout Egypt perform labour of a kind and severity which would appear incredible to females in our more favoured land. The examination of luggage is really quite a farce, since a few piastres serve at once as a convincing proof to the officers that nothing contraband is possessed.

Alexandria, or as the Arabs term it, *El-Iskandireh*, as it now exists, is not a very large city. It has gone through many and great changes since the period when the son of

either in extent or beauty; and, while it owes very much of its present importance and improvement on former days to the genius and policy of Mohammed Ali, it still appears as a mere remnant of departed glory and grandeur, and, as it were, in a condition than which nothing could well be worse. It is

curious to contrast the language of the ancient geographer Strabo with the representations of modern travellers: the former, in his great work on Geography, says: "The site of the city has the form of a (Macedonian) mantle, whose two longest sides are bathed by water to the extent of nearly thirty stadia (*i. e.* 3½ miles), and its breadth is seven or eight stadia (*i. e.* a mile), with the sea on one side, and the lake (Mareotis) on the other. The whole is intersected by spacious streets, through which horses and chariots pass freely; but two are of greater breadth than the rest, being upwards of a *plethrum* =101 feet) wide, and these intersect each other at right angles. Its temples, grand public buildings, and palaces, occupy a third or a fourth of the whole extent, for every successive king, aspiring to the honour of embellishing these consecrated monuments, added something of his own to what already existed. All these parts are not only connected with each other, but likewise with the port and the buildings that stand outside of it."

Under the Ptolemies, to whom Egypt fell on the demise of Alexander the Great, it became the metropolis of their empire, and one of the most flourishing cities of antiquity When it was annexed by Augustus to the empire of Rome, it is said to have occupied a circumference of thirteen miles, and to have had 300,000 free inhabitants, besides slaves, who were probably equally numerous. It was regularly and magnificently built, was the principal entrepôt of the trade of antiquity, being, in fact, the market where the silk, spices, ivory, slaves, and other products of India, Arabia, and Ethiopia, and the corn of Egypt, were exchanged for the gold, silver, and other products of the western world The inhabitants were distinguished by their industry, either sex and every age were engaged in laborious occupations, and even the lame and the blind had appointments suited to their condition Under Roman emperors Egypt became a principal granary for the supply of Italy, and its provision was reckoned of the utmost importance, and watched over with peculiar care Various privileges and immunities were conferred on Alexandria, many of her inhabitants were admitted to the rights of Roman citizens, and her wealth and prosperity continued undiminished

But Alexandria was still more distinguished by her eminence in literature and philosophy than by her commercial riches. The schools of geometry, astronomy, physic, and other branches of science maintained their reputation till A D. 640, when, after a siege of fourteen months, Alexandria was taken by Amrou, general of the Caliph Omar. The conquerors were astonished by the greatness of the prize, and Amrou, acquainting the Caliph with its capture, say, "We have taken the great city of the west. It is impossible for me to enumerate the variety of its riches and beauty; and I shall content myself with observing that it contains 4,000 palaces, 4,000 baths, 400 theatres or places of amusement, 12,000 shops for the sale of vegetable food, and 40,000 tributary Jews. The town has been subdued by force of arms, without treaty or capitulation."

Few of those who have visited Alexandria within the last twenty years, can bring themselves to imagine that it once deserved such high epithets, or was really the great and magnificent city which the ancients would lead us to suppose. Hardly one but what speaks of it in terms of deep disappointment, and probably, among the places of which we read, and concerning which the imagination becomes excited and aroused, by pondering over the glory and renown of other days, there is none which more effectually damps, if not destroys, all enthusiasm, than the present city of Alexandria.

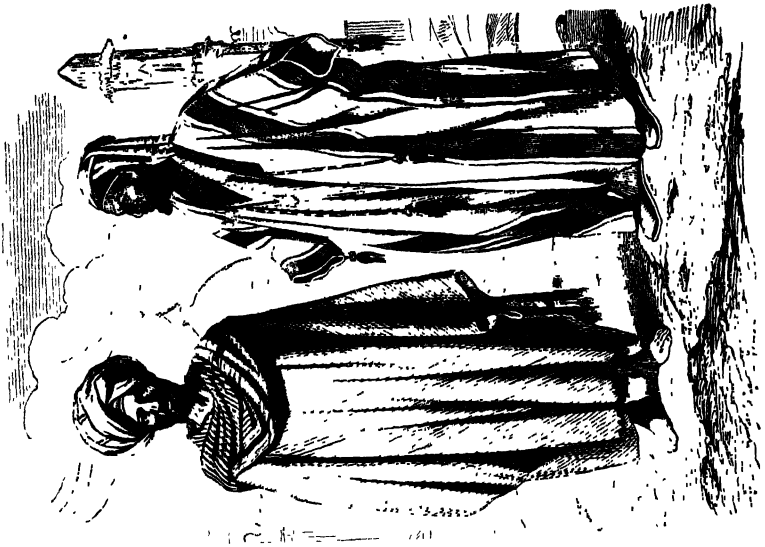
In many respects Alexandria has lost its oriental aspect, and can hardly be said to give a very good idea of an Eastern city. The influence of European habits and customs, and the effects produced by intercourse with the French and English, are quite evident; and it is not unlikely that in the course of time, and by the force of that almost necessity of a free and uninterrupted passage for England to her East India possessions, by way of Alexandria, Suez, and the Red Sea, the change will become still more marked, and according to our ideas the improvement in the city still more important. But as it now is, there is something very melancholy and unpleasant to one accustomed to clean and paved streets, to broad avenues regularly swept and washed, and lighted at night with gas, to elegant edifices for both private and public use, and to the numerous conveniences which mark the refined state of society in the west of Europe. In Alexandria the streets are unpaved, and consequently either very dirty or muddy. In general there are no broad streets or avenues, most of the passages from one part of the city to the other being narrow, crooked, and arranged with an apparently total disregard of public convenience. As may be supposed, the mud reposes quietly, until it is dried up by the influence of the sun and wind, and the continual trampling and scattering of it by the bare-footed fellahs; and the dust blows about to the infinite annoyance of everybody, until a fall of rain converts it into a thick, clayey, and very adhesive mixture. At night it is impossible to go out without a servant and a lantern; and, save ere and there, an occasional glimmer of a light in some Frank residence, the city is shrouded in darkness and a gloom which can hardly be characterised in any other way than as oppressive and disagreeable in the extreme. If we except the Frank quarter, or that part where the consuls and most of the foreigners reside, it is astonishing to notice what an air of miserable desolation—the term is not too strong—many por- of the city present half-finished houses, portions of walls, and heaps of stones and dirt, lying in confused masses; wretched hovels, most of them roofless, and destitute of every convenience which can minister to the wants of life, and to render the picture complete, half-clad, filthy and degraded people, men, women, and children, with their little stock in the way of fowls, goats, or donkeys, all occupying some favourite corner of their unique habitation, and all apparently on an equality,—these and such like, are the things which strike a visitor from a country like ours, where civilisation, refinement, and the general diffusion of the comforts and blessings of life are our proudest boast and unestimable privilege

That portion of the city which is more peculiarly Arabic, can be termed otherwise than a labyrinth of lanes, narrow passages, and winding thoroughfares. With singular ill-taste and worse judgment, under a hot sun, the houses are mostly whitewashed, rarely have any windows in front, and present an aspect at once repulsive and melancholy In the lanes and streets where the bazaars are situated, the oftimes has a lively, and, in many respects, a peculiarly oriental appearance Everything is open to the street, and in a little shop, slightly elevated above the passer-by, surrounded by his goods, such as they may chance to be, and smoking his pipe, the master or shopkeeper sits. With listless indolence he waits for customers, who now and then assemble, Turks, Arabs, Greeks, Copts, and foreigners of all nations, and commence a long, prosy, and noisy discussion, chicaneing the goods, haggling about the price, and occasionally getting up a quarrel, remarkable rather for words than anything else At the same time crowds of persons are passing, many on foot, some on donkeys, mules, and horses; the boys who drive the donkeys shouting to the people to take care; now a train of camels with immense loads move slowly along, and cause everybody and everything to give place; now a file of Egyptian soldiers, in their white cotton clothes and bright-red tarbushes, stroll carelessly towards their barracks, no person of consequence, preceded by his groom, snapping a large whip, rides by; now some veiled object hid in silks and astride an ass, occasionally with a child sitting in front, ambles quietly through the crowd with her attendant driver or groom, and so on, with one thing after another, the noisy, bustling, but in effect idle and inefficient, Arabs spend their time day after day, and year after year, without ambition, and it would seem well-nigh without hope.

At first sight, it would appear that nothing could be worse than the condition of the fellahs, or common people of Egypt; scantily clad at best, and oftimes nearly destitute of rags to cover their nakedness, squatting down at the corners and on the sunny sides of the streets, or lying at full length on the ground; children frequently perfectly naked, and, without exception, as filthy as neglect and superstition can render them; the men with a pipe, when they can get one, the women with a child astride their shoulder and another in their arms, or carrying some heavy burden on their head; all these, with their dark skins, naked legs and arms, and other peculiarities which need not be mentioned, strike the attention with a force

hardly to be expressed in words, and certainly give the traveller the impression that the modern Egyptians are degraded to the lowest point possible in the social scale. But it would not be quite fair to take an extreme view of the matter: degraded and oppressed they certainly are, ignorant and superstitious to a degree almost incredible, and deprived of nearly every comfort and enjoyment which we regard as essential to happiness, yet nevertheless, astonishment cannot fail to be excited at their light-heartedness, their patient endurance of fatigue and want, their noisy merriment, the affecting care and tenderness of mothers for their offspring, their contentedness with scanty fare, and such like qualities, which, although they do not prove anything in respect to their condition when estimated by the scale of European civilisation and refinement, certainly go far to show that as they have never known, so they can hardly be said to feel, the want of what we are accustomed to regard as the essentials of life. After all, however, it must be acknowledged that the scenes here to be witnessed are distressing, and far from pleasing. [illegible] disposed to think highly of cleanliness and its accompaniments. [illegible] thing to see children entirely naked in the streets and outskirts of the town, and both women are frequently so insufficiently clad as to shock our notions of decency, and particularly of modesty, one, however, soon becomes accustomed to all this, as well as other things, but what is really disgusting, and all the more so from its prevalence and its connexion with one of their ridiculous superstitions, that of the *evil eye*, is the most abominable and filthy condition of the children's persons generally, and their eyes in particular. Ophthalmia is lamentably prevalent throughout Egypt, especially among the natives, a fact which might surprise those who are unacquainted with the causes which tend to promote the spread of so serious an affliction; but all wonder ceases when a little experience has made them.

Alexandria is but the shadow of what it formerly was, and knowing what glory, greatness and magnificence it once possessed, it may seem astonishing that there are so few marked traces of former grandeur at present existing. Here and there appear, it is true, the scant remains of what [illegible] concluded to be, portions of ancient palaces or edifices renowned in history, now and then amid the heaps of rubbish are found broken columns, beautifully-wrought capitals, fragments of an archway, pieces of stone and ancient brick, indicating at some unknown period in the past the number, extent, and beauty of the buildings which formerly adorned the capital of the Ptolemies; but who can tell anything worth knowing about them? and who is able to point out with any certainty, or identify with any probability, what may yet exist of the splendid temples, the gorgeous palaces, the spacious baths, or the noble halls of learning of ancient Alexandria? Who can stand in the midst of this mass of utter ruin and desolation on every side, without meditating, for the moment at least, upon the instructive lessons and warnings of the past?



Outside the city walls and fortifications the pillar appears which custom and tradition have combined to call by the name of Pompey, and for a long time to associate with the name of the great rival of Julius Cæsar. It is situate on an eminence, considerably above the road and neighbouring Turkish burying-ground, and is quite alone, apart from any edifice, standing in silent, nay, almost gloomy grandeur. The absurd practice of scribbling names on celebrated objects and in noted localities is here displayed in a scandalous manner, and between the black paint, tar, and other substances used on the base, and even the capital, the column is disfigured and sadly marred. If Mr. "G. Button," "Wm. Thompson," "E. Scott," and others, could but know what annoyance their silly proceedings have caused travellers and admirers of art, they would probably have paused ere they disgraced themselves by daubing their names in great staring black and white letters on Pompey's Pillar.

The foundation on which the pedestal is placed is of rough stones cemented together, and was no doubt at one time covered from view. The pedestal itself is of hard reddish granite, much worn by the weather on one or two sides, and evidently not from the same quarry with the shaft which has been raised upon it. The same remark applies to the capital, which appears to be of inferior workmanship and quality, and together with the pedestal is thought to be of a different epoch by Dr. Clarke, Wilkinson, and others. The shaft is certainly a very noble and imposing one, rising aloft, in one solid block, more than 70 feet, elegantly proportioned and beautifully wrought. According to Sir Gardner Wilkinson, the total height of the column is 98 feet 9 inches, the shaft is 73 feet, the circumference 29 feet 8 inches, and the diameter at the top of the capital 16 feet 6 inches. Mrs. Poole, following the measurements of Mr. Lane, her brother, gives the shaft of the column as 68 feet in height and 9 feet in diameter at the bottom, and the total height 95 feet. Other writers, quoted by Dr Russell, speak of Pompey's Pillar as much higher. The material is what is termed the red Syenite or Egyptian granite, and not porphyry, as Russell, in his "Ancient Egypt," asserts on insufficient authority. Rarely, if ever, has a column of victory which, even though this is at present in a lone and desolate position, appeared more nobly or more strikingly, and perhaps [illegible] of the kind excites more varied emotions, or impresses the mind more forcibly with a conviction of the emptiness of warlike renown than this, with which the world has become familiar in connexion with the name of one of Rome's greatest of generals.

Leaving Pompey's Pillar, and returning by nearly the same road, and passing several gardens of palms, oranges, and citrons, and some rather pleasant looking villas, the great square towards the new harbour is crossed. The two obelisks called Cleopatra's Needles lie at only a short distance from the [illegible] quarter, and though not quite so desolate as Pompey's [illegible], so far as human beings are concerned, they are even more depressing and saddening in their effect upon the mind by the misery, degradation, and filth in close vicinity. The [illegible] lie close to the water's edge, and in the immediate proximity of the remains of an old Roman tower. It [illegible] to the height of nearly 70 feet, is about 8 feet in width at the bottom, tapering off gradually to less than 5 feet at the point, where a pyramidical pinnacle, if it may be so styled, completes the obelisk, and to one unacquainted with the hieroglyphics with which each of the four faces is covered, [illegible] and almost solemn aspect. The material out of which the obelisks were cut is the red granite of Syene, which is exceedingly hard and durable, but does not appear to admit a very fine polish. There are three lines of hieroglyphics on each side, reaching from the topmost point to the bottom of the obelisk, the central one is much the earliest, and fixes the date of the king in whose reign it was originally wrought out and erected at the place whence it was brought to Alexandria. One of the ovals of the central line of hieroglyphics, is 4 feet in length, by about two-thirds of that amount in width, a fact which may help to give some idea of the size and imposing appearance of these stately blocks of granite, and the sculptured story of other days which they tell. Sir Gardner Wilkinson, whose authority is especially high in all these matters, informs us that the ovals in the centre are those of Thothmes III., a monarch whose reign he dates about B.C. 1495, or nearly the period of the Exodus of the children of Israel. "In the lateral lines," he goes on to say, "are the ovals of Rameses the Great, the supposed Sesostris (B.C. 1355), and additional columns of hieroglyphics at the angles of the lower part, present that of a later king, apparently Osirei II (B.C. 1255), the third successor of the great Rameses."* It appears further, that these obelisks stood originally at Heliopolis, a city at no great distance from Cairo, and were brought to Alexandria by one of the Cæsars to grace that noble capital of the Ptolemies.

At a short distance, and nearly covered with sand and dirt, lies the other obelisk, the base and about half of the lower portion are completely covered, and probably a part of the obelisk is under the high sea-wall which incloses the great harbour. It has suffered much injury from various causes, but principally from being exposed to the influence of the weather, and the careless ignorance and folly of the natives, as well as some of the tribe of travellers, a class of persons who are not always either the best informed or the most concerned to leave unharmed the valuable remains of a past age. The prostrate obelisk answers in all important respects to its

* Hand Book of Egypt, p. 91.

FELLAHS OF EGYPT.

EGYPTIAN WOMEN.

counterpart, which stands near by, and so needs no special description. The obelisk which now lies on the ground exposed to every chance of injury, was many years ago presented by Mohammed Ali to the English government. So far as appears, it might have been removed without incurring any great expense, and would have formed a grand ornament for some conspicuous position in London. It is both more ancient, and perhaps of more durable material than the obelisk of Luxor, which adorns the Place de la Concorde in Paris, and which was brought thither at an immense expense of time, labour, and money. Lord Nugent* is one of the English travellers who deeply regrets what he considers culpable negligence on the part of his country. Sir Gardner Wilkinson, however, is of opinion that the obelisk is too much injured and defaced to be worth the expense of transportation, and declares that the project has been wisely abandoned.

There is something very impressive in the sight of such immense blocks of stone, cut out of quarries nearly eight hundred miles distant, and transported and erected with a care and skill which utterly exceed the power of the present race of inhabitants. Modern times are much given to boasting, and certainly some very surprising exhibitions of mechanical skill have been presented to the admiration of the world; but nothing is so astonishing, and yet so little known, as the means by which the genius of ancient Egyptian architects accomplished the works which we now see, and seeing, cannot help admiring and wondering at. What machines must they have had, what energy to direct, what capacity to combine, what knowledge of natural philosophy, to apply to their proper end the means and facilities of labour! and how surprising does it seem that we know absolutely almost nothing, save what is inferred from their remains, of what this mighty people were capable of doing, and of course of teaching to the world at large!

SOLDIERS OF EGYPT.

THOMAS HOLCROFT.

(*From Recollections of a Literary Life; by Miss Mitford*)

I REMEMBER saying one day to a woman of high genius that a mutual friend of hers and mine proposed to give a series of lectures on authors sprung from the people—from the masses, as it is the fashion to say now-a-days—and her replying quickly: "Why, all authors who are worth reading are sprung from the people;—it is the well-born who are the exceptions." And then she ran through a beadroll of great names from Chaucer to Burns: nevertheless, this repartee was not quite right; not a whit more right than a repartee usually is; for the number of educated writers must always preponderate. But still the class of self-educated writers is large, increasingly large; and truthful biographies of such persons must always be amongst the most interesting books in the world, as showing better than any other books the development and growth of individual minds.

Mr. Bamford's "Life of a Radical," and Mr. Somerville's account of his own career have much of this merit; but the most curious of all these memoirs, both for the vicissitudes of the story and the indomitable character of the man, is the "Life of Thomas Holcroft," begun by himself and concluded by Hazlitt.

Of his strength of character no better evidence can be offered than that the first seventeen chapters were dictated by him during his last illness whilst he was in such a state that he was frequently obliged to pause several minutes between every word, and yet the events are as clearly narrated, and the style is as lucid and as lively, as if it had been written in his most vigorous day.

He was born in London in the winter of 1745, his father being by trade a shoemaker, but of a disposition so unsteady that he never could remain long in any place or at any occupation. Here is the account his son, a most dutiful and affectionate son who maintained him to his death, gives of these rambling propensities:

"Having been bred to an employment for which he was very ill-fitted, the habit that became most rooted in and most fatal to my father was a fickleness of disposition, a thorough persuasion after he had tried one means of providing for himself and his family for a certain time, that he had discovered another far more profitable and secure. Steadiness of pursuit was a virtue at which he never could arrive; and I believe few men in the kingdom had in the course of their lives been the hucksters of so many small wares, or more enterprising dealers in articles of a halfpenny value. * * * * *

"My father became by turns a collector and vender of rags, a hardwareman, a dealer in buttons, buckles, and pewter spoons, in short a trafficker in whatever could bring gain. But there was one thing which fixed his attention longer than any other, and which therefore I suppose he found the most lucrative, which was to fetch pottery from the neighbourhood of Stoke in Staffordshire, and to hawk it all through the north of England. Of all other travelling this was the most continual, the most severe, and the most intolerable."

In all the wanderings of the itinerant father, the little Holcroft took part till he was about ten years old; then came a spell of shoemaking and a violent attack of asthma, aggravated by the stooping position, which continued a year or two longer. The disease was at length removed by the skill of a

* Lands Classical and Sacred, vol. i. p. 64.

country apothecary, and a fresh impulse was given to the poor boy's aspirations by the sight of a strongly-contested horse-race at Nottingham. His longings to be allowed to minister in some way to that noble animal became irrepressible; he confided them to his father, and was fortunate enough to be received into the service of a respectable man who kept a training stable near Newmarket. There being placed a horse too spirited for his youth, his feebleness, and his inexperience, he got a terrible fall and what he grieved for more, a dismissal. He was received by another trainer and dismissed again. At last he made a third application

This last application was made to John Watson, the celebrated race-horse trainer, of Newmarket, and so successful a rider did the lad become, that he was frequently chosen to back the most restive and unmanageable animals. Under his care they became as gentle as lambs In the service of Mr Watson, who is described as a good-natured free sort of man, young Holcroft remained till he was about sixteen. Then he began to feel a craving for knowledge of a different nature from any that he could obtain at Newmarket, although even there he had contrived to read every book that came in his way, to perfect himself in arithmetic, and to acquire a scientific knowledge of vocal music, which was of great use to him in his after career. He had made this progress, too, chiefly from his own efforts, so that the great process of self-instruction, which distinguished him through life was now begun, and he already knew enough to feel an ardent desire to know more. London, where his father was now living as a cobbler, offered at least the hope of education, accordingly, to the great amazement and regret of good John Watson, who had been uniformly kind to him, and to whom he could hardly summon courage to announce his determination, he abandoned the field in which his success had been so encouraging, took leave of his companions, biped and quadruped, and made his way to the great city.

Here a long series of disappointments awaited him He became, indeed, a skilful and rapid worker at the shoemaking trade, but the position and confinement disagreed with him (well they might after the free seat on horseback, the exercise, and the pure air of Newmarket), and his habit of *living his time in reading*, as the phrase goes, prevented his earning more than the bare necessaries of his abstemious life He tried various schemes, taught an evening school kept a day school somewhere in the country, with such indifferent success that he had but one pupil, and lived upon potatoes and buttermilk for three months; authorship, too, he tried in a small way, creeping into notice in the most obscure newspapers and the smallest magazines, and at about the age of twenty, when barely able to support himself, he married It is to be noticed, that throughout his whole life he was eminently a marrying man, having married three wives, and left a young widow, the daughter of Monsieur Mercier, author of the "Tableau de Paris." Shortly after his first marriage, of which we hear but little, although he was eminently kind and indulgent in his domestic character, he seems to have been induced, by his success in a society club, to try his fortune on the stage. He has left a circumstantial account of his application to Foote.

He had the good fortune to find the manager at breakfast with a young man, whom he employed partly on the stage, and partly as an amanuensis. "Well," said he, "young gentleman, I guess your business by the sheepishness of your manner, you have got the theatrical *cacoethes*, you have rubbed your shoulder against the scene: nay, is it not so?" Holcroft answered that it was. "Well, and what great hero should you wish to personate? Hamlet, or Richard, or Othello, or who?" Holcroft replied that he distrusted his capacity for performing any that he had mentioned. "Indeed!" said he, "that's a wonderful sign of grace. I have been teased these many years by all the spouters in London, of which honourable fraternity I dare say you are a member; for I can perceive no stage varnish, none of your true strolling brass lacker on your face," "No, indeed, Sir." "I thought so. Well, Sir, I never saw a spouter before that did not want to surprise the town, in Pierre, or Lothario, or some character that demands all the address and every requisite of a master in the art. But, come, give us a touch of your quality—a speech. There's a youngster," pointing to his secretary, "will roar Jaffier against Pierre. Let the loudest take both." Accordingly, he held the book, and at it they fell. The scene they chose was that of the before-mentioned characters in "Venice Preserved." For a little while after they began, it seems that Holcroft took the hint that Foote had thrown out, and restrained his wrath. But this appeared so insipid, and the ideas of rant and excellence were so strongly connected in his mind, that when Jaffier began to exalt his voice, he could no longer contain himself; but, as Nic Bottom says, "They both roared so, that it would have done your heart good to hear them." Foote smiled, and after enduring this vigorous attack upon his organs of hearing as long as he was able, interrupted them.

Far from discouraging our new beginner, he told him that with respect to giving the meaning of the words, he spoke much more correctly than he had expected. "But," said he, "like other novices, you seem to imagine that all excellence lies in the lungs; whereas such violent exertions should be used very sparingly, and upon extraordinary occasions; for if an actor make no reserve of his powers, how is he to rise according to the tone of the passion?" He then read the scene they had rehearsed, and with so much propriety and ease, as well as force, that Holcroft was surprised, having hitherto supposed the risible faculties to be the only ones over which he had any great power.

Thomas Holcroft came away from this celebrated wit, delighted with the ease and frankness of his behaviour, and elated with his prospect of success. Unluckily, however, he had already entered into negotiation with a very different person, and tempted by an offer nominally higher in point of salary, agreed with Macklin for a small engagement in a theatre in Dublin. The brutal manners of Macklin are well known Hazlitt says, that until the age of forty he could not even read, an assertion which, considering the undoubted merit of his play, "The Man of the World," appears all but incredible It is, however, certain that he was coarse, illiterate, and unfeeling, and the manner in which he suffered the Dublin manager to depart from the engagements into which he had entered with poor Holcroft does very little honour to his principles.

For the next seven years our luckless adventurer was tossed about the world as a strolling player, taking all parts, but succeeding best in old men and low comedy, singing in choruses, filling the post of prompter—always penniless, and sometimes nearly starved. At the end of that time his prospects improved, some family connexion (it is not said what) threw him upon the powerful protection of the Grevilles and the Crewes, and we find him numbered in the Drury Lane company, and complaining in a letter to Sheridan of walking in processions, and playing the part of a dumb steward in "Love for Love"

Nevertheless, matters are mending He takes a house in London, marries a second wife, becomes a recognised author, and is employed by the London booksellers to write an account of the riots of 1780. Whilst attending the Old Bailey trials for that purpose, he was happy enough to save the life of an innocent man, who had nearly been condemned through the mistake of a witness

Things go better. He brings out his less-known novels; his least celebrated, but still successful plays; and becomes one of the best and most voluminous translators upon record. If ever one happens to take up an English version of a French or German book of that period—"Memoirs of Baron Trenck," or "Caroline de Litchfield"—and if that version have in it the zest and savour of original writing, we shall be sure to find the name of Thomas Holcroft in the title page.

One of his translating feats was remarkable. Beaumarchais' wonderful play of "Figaro" was carrying the world before it in Paris, and would be sure to make the fortune of an English theatre But the comedy was unpublished, and no copy could be procured from any quarter. Holcroft made up his mind to attend the performance every evening until he had fixed the whole work in his memory. He took a friend with him, and they wrote down their several recollections on their return, very literally comparing notes. When it is remembered that the "Marriage of Figaro" is the longest play in the French language, the effort of a foreigner bringing the whole away in a week or ten days will appear most extraordinary, for not the slightest memorandum could be made in the theatre. His

translation under the name of "Follies of a Day" appeared almost immediately at Covent Garden, producing him six hundred pounds from the manager, besides a large sum for the copyright.

This was perhaps the happiest time of Mr. Holcroft's life—this and a few succeeding years. His comedies, "Duplicity," "The School for Arrogance," and "The Road to Ruin," evinced talent (I had well nigh written genius) of the highest order. The serious parts above all are admirable. Perhaps no scenes have ever drawn so many tears as those between the father and the son in the last-mentioned play. The famous "Good Night" is truly the one touch of nature that makes the whole world kin; and although I have seen it played as well as anything can be played by Munden and Elliston, I have always felt that the real merit belonged to the author. His greater novels, too, "Anna St. Ives" and "Hugh Trevor," were full of powerful writing; and he seemed destined to a long course of literary prosperity. A terrible domestic grief came to break the course of this felicity. I transcribe Mr Hazlitt's narrative.

"William Holcroft was his only son, and favourite child, and this very circumstance, perhaps, led to the catastrophe which had nearly proved fatal to his father, as well as to himself. He had been brought up, if anything, with too much care and tenderness; he was a boy of extraordinary capacity, and Mr. Holcroft thought no pains should be spared for his instruction and improvement. From the first, however, he had shown an unsettled disposition, and his propensity to ramble was such, from his childhood, that when he was only four years old, and under the care of an aunt in Nottingham, he wandered away to a place at some distance, where there was a coffee-house, into which he went, and read the newspapers to the company, by whom he was taken care of, and sent home. This propensity was so strong in him, that it became habitual, and he had run away six or seven times before the last.

"On Sunday, November 8th, 1789, he brought his father a short poem. A watch, which had been promised to him as a reward, was given to him, his father conversed with him in the most affectionate manner, praised, encouraged him, and told him that, notwithstanding his former errors and wanderings, he was convinced he would become a good and excellent man. But he observed, when taking him by the hand to express his kindness, that the hand of the youth, instead of returning the pressure as usual, remained cold and insensible This, however, at the moment was supposed to be accidental He seemed unembarrassed, cheerful, and asked leave, without any appearance of design or hesitation, to dine with a friend in the city, which was immediately granted. He thanked his father, went down stairs, and several times anxiously inquired whether his father was gone to dress. As soon as he was told that he had left his room, he went up stairs again, broke open a drawer, and took out forty pounds With this, the watch, a pocket-book, and a pair of pistols of his father's, he hastened away to join one of his acquaintances, who was going to the West Indies. He was immediately pursued to Gravesend, but ineffectually. It was not discovered till the following Wednesday that he had taken the money. After several days of the most distressing inquietude, there appeared strong presumptive proof that he, with his acquaintance, was on board the 'Fame,' Captain Carr, then lying in the Downs. The father and a friend immediately set off, and travelled post all Sunday night to Deal. Their information proved true, for he was found to be on board the 'Fame,' where he assumed a false name, though his true situation was known to the Captain. He had spent all his money, except fifteen pounds, in paying for his passage, and purchasing what he thought he wanted. He had declared he would shoot any person who came to take him; but that if his father came he would shoot himself. His youth, for he was but sixteen, made the threat appear incredible. The pistols, pocket-book, and remaining money were locked up in safety for him by his acquaintance. But he had another pair of pistols concealed. Mr. Holcroft and his friend went on board, made inquiries, and understood he was there. He had retired into a dark part of the steerage, When he was called, and did not answer, a light was sent for; and as he heard the ship's steward, some of the sailors, and his father, approaching, conscious of what he had done, and unable to bear the presence of his father and the open shame of detection, he suddenly put an end to his existence.

"The shock which Mr Holcroft received was almost mortal. For three days he could not see his own family, and nothing but the love he bore that family could probably have prevented him from sinking under his affliction. He seldom went out of his house for a whole year afterwards; and the impression was never completely effaced from his mind."

The life of John Holcroft from this period belongs rather to political than literary history. He was included in the list of the "dangerous class," and, with Hardy, Thelwall, Horne Tooke, and eight others, was indicted for high treason. The story of their acquittal is well known; but the effect of the accusation on Holcroft was extremely painful. He was openly spoken of as an acquitted felon; his plays were published anonymously, and, wearied out with these conflicts with public opinion, he retired first to Hamburgh and then to France, where he resided many years, occasionally sending to England translations of popular foreign works

This author, so gifted, so various, and so laborious, one of the most remarkable of self-educated men, died in London on the 3rd of March, 1809, after a long and painful illness, at the age of sixty-three, I fear poor.

STANZAS

Written on reading an Account of the Destruction of the **Amazon** Steam-ship by fire, on the morning of Sunday, **January 4, 1852.**

Like a palace on the waters,
Like a castle on the deep,
Towering high above the billows,
See a mighty steam-ship sweep
Skilful hands are there to guide her
'Mid her wild and watery path,
Should the howling winds assail her,
Or the tempest's stormy wrath
Many joyful hearts are in her,
Bound from Britain's friendly land,
Hoping soon to tread in safety
On Columbia's sunny strand.
Some on business, some on pleasure,
Seek the Caribbean shore—
One upon a heavenly mission—
One in search of Indian lore
Evening came with sable shadows,
Dimming ocean vast and lone,
While she still swiftly o'er the billows
Sailed the splendid Amazon
Silent night hung o'er the waters—
Slumber sealed the weary eye—
But, alas! [illegible] night,
Rose a loud [illegible] cry!
Sleepers, wakened from their pillows,
Saw a fearful, dreadful scene—
From the vessel's bursting bosom
Smoke and lurid flames were seen!
What a terror striking prospect!
What a sudden, certain death!
Underneath the raging waters,
Flames around with burning breath!
Who can paint the awful picture—
Who that moment's terrors tell?
Many sank 'mid ocean's surges—
Ocean tolls their mournful knell!
[illegible] palace
[illegible] torn,
Few escaped to tell the story,
Or the dire disaster mourn.
Oh! lament for those who perished!
Weep the young, the good, the brave,
At dark midnight raised from slumber
To be buried 'neath the wave!
Lately, full of life and gladness,
Hope illumed each sparkling eye;
But, alas! in depth of ocean,
Lone and lifeless now they lie!

ARTIFICIAL LIMBS.

In few branches of mechanical science has greater advancement been made within late years than in the invention and manufacture of remedies for the various ills and accidents to which humanity is liable. If art and science have been made to work together for the production of long-ranges, needle-guns, and other engines of destruction, we find them allied, too, for a nobler purpose—the alleviation and removal of human suffering. There is scarcely any not vital injury which the body can receive for which they have not provided a remedy of some sort. Whether it be the result of accident or disease, the detriment can in most cases be repaired, and the inconvenience which it involves be removed by some artificial substitute for that which has been lost. The very defects of nature can be supplied, and the ravages of time itself be concealed or repaired. Baldness is put to flight by the skill of the *coiffeur*, teeth which nature has made irregular, or which time or accident has destroyed, can be set right or renewed, in almost their original efficiency, by the dentist; and even eyes can be inserted so perfectly resembling the natural organ as to puzzle the "closest observer." But a still greater triumph of the surgical mechanist's art than this last is the creation of whole limbs, and their application to the mutilated or imperfect framework of man. It is by these aids especially that the aged or crippled body can play the hypocrite, and be restored to somewhat of the serenity and comfort of life which accident or disease may have marred. The wig-maker or the dentist may give back more or less of the coveted appearance and freshness of youth, but the surgical mechanist confers still more valuable and practical benefits upon those who require to avail themselves of his skill.

Fig. 1.

As an illustration of the great progress which has been made in this branch of art, we present our readers with engravings of some specimens which appeared in the late Exhibition. They have been selected from the works of Camillo Nyrop, the surgical mechanist to the University of Copenhagen.

Fig. 1 represents an artificial leg intended for every variety of circumstances in which such a mechanical help is needed—in the fracture of a bone, or other violent injury to it, or where, through a disease of the bone, the surgeon is compelled, in order to save his patient's life, to sacrifice the limb, by amputating it near the hip. The stump is then inserted in the artificial thigh, as a substitute, and the entire leg is firmly fastened to the waist by a strap. With these legs the wearer can walk about without inconvenience, and with much of the easy spring and elasticity of the natural limb. The following figures will illustrate the manner in which the joints are made to work:—Fig. 2, which represents the ancle and foot, shows how the necessary bendings of the artificial limb are effected by the weight of the material employed, in connexion with the pressure of the living stump. But since no muscles, or independent power of motion, can be given to such mechanical contrivances, it becomes necessary that some other plan should be devised, by which, after the bending of the joint, the foot should be enabled to return to its proper position. This is effected by means of springs. These are seen in the intersection of the sole, to which the fore-part of the limb, containing the toes, is fastened by little hooks grooved in under the foot.

Fig. 2.

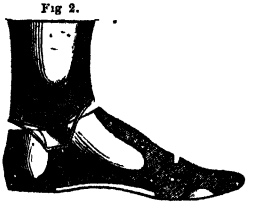

Fig. 3.

Fig. 3 more clearly illustrates the manner in which these springs are attached to the sole. This and Fig. 2 show the principle on which the Danish mechanist provides for the easy and natural action of the foot in walking.

Fig. 4.

Fig. 4 is an artificial hand made of wood, in which the direction of the concealed springs is marked by the dotted lines. By the peculiar action of these springs the wearer is enabled to perform many of the usual movements of the natural hand with great precision and effect.

Fig. 5 shows the use which can be made of this artificial hand in writing. The entire motion is necessarily communicated by the living arm, as the finger is immovably fastened to the pen. In case of the loss of the right hand, the best substitute in writing is of course the left, which can easily be trained to the practice; but where the unfortunate sufferer may happen to have lost both hands, it is no small boon that he can avail himself of these mechanical helps with such practical convenience and effect.

Fig. 5.

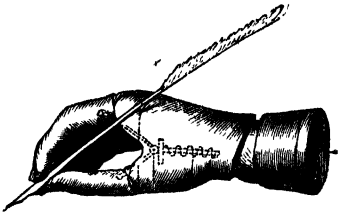

Fig. 6. This engraving shows how the artificial hand may be employed in card-playing. The cards are held by means of a glazed metallic plate fastened to the palm in such a manner as that they can be readily altered or withdrawn by the natural hand.

Fig. 7 represents a chisel held by an artificial hand, and thus illustrates its adaptation to the more practical and strength-requiring duties of every-day life. It must be remarked, however, that its use, as in the engraving, is attended by some degree of pain to the wearer, as the hard mass

of the wooden hand, when the instrument within it is struck violently by the mallet, communicates a much more unpleasant sensation to the wearer than would be experienced by the natural limb under similar circumstances; as the nerves of the stump, to which the artificial substitute is fastened, are much more delicately sensitive than those of the healthy and uninjured arm.

Fig. 6.

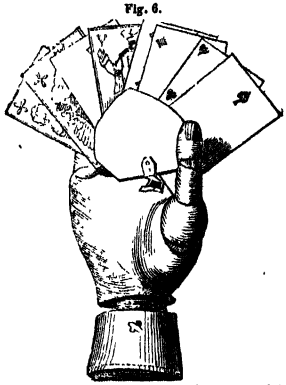

Fig. 8 is a sectional view of an artificial hand, to show the construction of the joints, which work upon accurately-turned wooden balls, in a manner similar to the action of the ball and socket in the natural limb. As these joints are of sufficient tightness and strength, such an artificial help can be made of considerable use, by pressing the fingers into the necessary position around the object to be held. In this, as in its lightness and close resemblance to nature, consists its vast superiority to the old lumsy and unseemly appendage of the and screw.

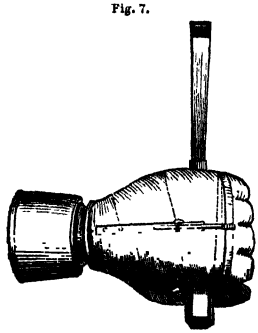
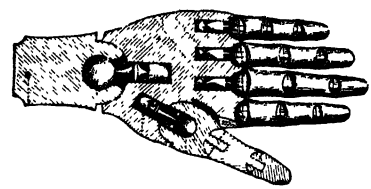
Fig. 7.





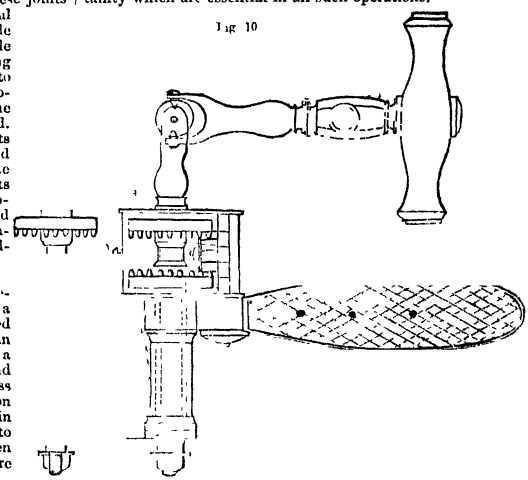


Fig. 9 represents a hand of a more complicated construction, in which, through a greater number of springs a succession of compound movements may be effected. The mechanical readiness of action, however, which a hand of this construction possesses, scarcely compensates for its inferiority in strength, and, consequently, in practical usefulness to the wearer, as compared with those which have been noticed. And even they, it must be confessed, are greatly inferior, too, in this very essential quality in an artificial limb which is intended for use to the hook and screw, upon which they are, in every other respect, so great an improvement.

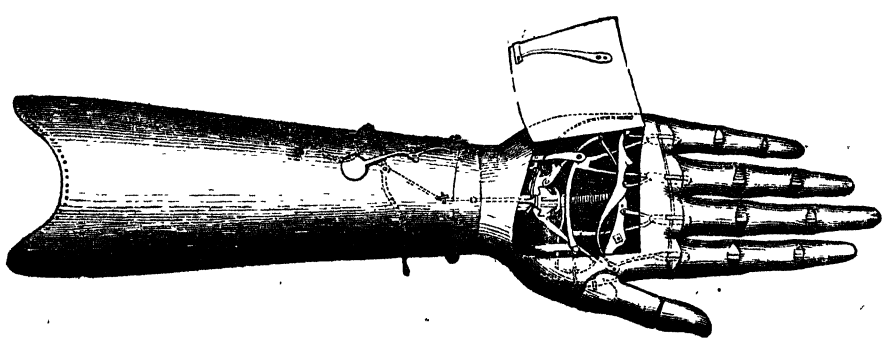

Fig. 10, called an *Osteotom* (bone-cutter), is a rotary saw invented by the same artist. The saw-blade is a hollow circle

fastened on to the end of the instrument, which the operator holds by two handles, as seen in the engraving. This instrument, however, has the common defect of all circular saws used for surgical purposes, namely, that it can only operate upon a small surface, and the depth to which the blade may penetrate cannot be regulated with that exactness and certainty which are essential in all such operations.

Fig. 10

MR. ALFRED VERDANT'S GAMBLING EXPERIENCES, AND WHAT CAME OF THEM.

In Six Chapters.—Chapter the First.

Introduces Mr. Alfred Verdant to the British Public.

Mr. Verdant, our hero, is not a genius. Although it is rather a disparaging fact, it is one which cannot be concealed, even from himself. A long account, therefore, of his birth and parentage, of what he did and said, and what he caused other people to do and say, during the interesting period of his extreme childhood, with a prolix description of his great ability or his great dulness—for geniuses are invariably distinguished by one or the other of these qualities—during that equally interesting period, his school-days, may be very well dispensed with. So that our hero not being a genius is, all things considered, rather a fortunate circumstance for both reader and writer, the former being saved many "pshaws!" and "pishes!" and the latter the trouble of some rather tedious invention.

But if Mr. Alfred Verdant was not a genius, he was a young man of most undeniable talent, most fair and open disposition, and most agreeable manners and address. Further description of the qualities of his mind and person is needless, for there is no doubt that our fair readers have already, each one for herself, fixed upon his height, the colour of his eyes and hair, and the particular cut of his clothes. It remains but to be mentioned, therefore, that he had just left his parental roofree to "see life in London," before he entered upon the great battle of existence, that he was on good terms with his tailor, and had taken lodgings with an old school friend at the west-end of London, and his portrait is complete. British Public, Mr. Alfred Verdant, of Verdant-lodge, Fair oaks. Mr. Alfred Verdant, British Public, kind and indulgent to a fault. Gentlemen, be acquainted.

Chapter the Second.

Shows how Mr. Alfred Verdant was induced to become subscriber to Mr. Doombrown's "Offices."

A great place, an interesting place, a wonderful pla incomprehensible place, an overwhelming place, is London, especially to one who, like Mr Alfred Verdant, visits it for the first time in his life, after having spent his twenty innocent years or so in a town so quiet and so shady as quiet and shady Fairoaks. Under the guidance of his accomplished and versatile friend, Tom Wido, it may be presumed that our hero was not long in making the acquaintance of the notabilities of the great city, or in becoming *au fait* to the doings of the brave spirits among its gay and youthful inhabitants.

But it was not all at once that Mr Alfred became fully alive to the greatness of the great metropolis. Oh dear, no. It was a fortnight at least before his head fairly ached over the breakfast table. He had duly gazed and wondered at the lions. He had paused reverently beneath the dome of Wren's great masterpiece, he had wandered silently among the storied tombs and chapels of Westminster, he had refreshed his antiquarian taste among the fortresses and dungeons of the Tower. He had walked, with quiet step and slow, amid the congregated wisdom of ages enshrined in many thousand tomes in the great library of the British Museum, he had stood, with wondering eyes and open lips, before the relics of the buried cities of the east, and had peeped, with unfeigned interest, into tombs where once had rested the royal bones of the kings and princes of old Egypt. And, ever as he returned, evening after evening, to his lodgings, after these walks and visits, he felt that London was not such a bad sort of place as he had been led to believe, and that a good-meaning young fellow might very well withstand the great temptations which he had heard were laid for the unmitiated in its every street.

But all this happened before his friend, Tom Wido, had found leisure to accompany him in his wanderings. Then, indeed, "a change came o'er the spirit of his dream." It is true that during the day he pursued much the same course as hitherto; but, somehow, he felt less interest in the buildings, [illegible] amusement in the crowded streets, since he had altogether uninterested spectator, on some of the hidden mysteries of the modern Babylon.

"Why, Alf, my boy," said the high-spirited Wido, as they sat one morning over a rather late breakfast, "you were most confoundedly in for it last night."

"In for it!" replied our hero, pressing his heated head within his hands, and looking up with bloodshot eyes, "I was drunk—drunk for the first time in my life, Tom! I am a beast!"

Well, you'll soon get over that. Here, take a draught of this. Nothing like a hair of the dog that bit you!" And, seizing a great goblet of soda-water and brandy, our hero made a gulp, and swallowed the draught as though it had been poison. "There, now, I think you'll do," pursued the gallant Tom. "But I say, old fellow! how came you to make such a precious stupid bet with the captain? Only fancy—fifteen to one on such a horse as Slyboots!"

"I bet! I bet!" exclaimed Alfred, looking up, all flushed and agitated. "I never made a bet in my life! You are joking."

"My dear friend," returned Tom, in his most distinct tones, "I never joke about matters of honour. I give you my word that you made a decided bet with Captain Smaltork of fifteen to one on Slyboots, for the Diddlebury steeplechase."

"Fifteen to one; well, that is not much to lose, however," replied Alfred.

"No, it's not much—only five-and-seventy pounds."

"Pounds! what do you mean?" almost shrieked Alfred, jumping up from the table, "I never could have been so mad!"

"True, 'pon honour," replied Tom. "After you had ordered the champagne, you said that you were good for anything, and when the captain asked you if you had laid out any money on the Dids, you said that you would take any bet that he liked to offer, and so, when the captain said that he could afford to take fifteen to one in ponies, you immediately [illegible] In fact, I entered the bet in your pocket-book for you, as you were too far gone to hold the pencil."

"Ah!" said Verdant, "I think I recollect something about it now. But I never meant to risk so much money, I'm certain. If I said anything about fifteen to one, I meant shillings. Indeed, I don't know what you mean by ponies."

"Well, Alfred," returned Mr Wido, "as you were in my company, I am in a manner responsible for your honour; and if you refer to your pocket-book you will find that the bet is entered as fifteen ponies—that is, five pound notes—to one on the horse Slyboots for the Diddlebury steeplechase, which takes place to-morrow."

"Seventy-five pounds," said Alfred, ruefully, reading the memorandum in his pocket-book. "It is a large sum of money, Tom. What would you advise me to do?"

"Why, really, Alf, it is no use blinking. The captain is terrible fellow, and if you do not pay him, in case you lose—which you are not sure to do, by the way—he will call you out. I'm told he's a dead shot. If I were you, I'd hedge."

"Hedge? I don't quite understand," remonstrated Alfred.

"Why, how awfully green you are, my boy! By hedging mean that you must take the odds from somebody else."

"And can I do so?" inquired Alfred, like a drowning man catching at a straw.

"Nothing more easy, my dear fellow. Just finish your breakfast, and come with me."

In another half-hour our hero and his friend were standing together in Mr. Doombrown's "offices," examining the "lists as they hung upon the green baize-covered walls. Now the "offices" of this gentleman were unlike any other that our hero had ever before seen. The windows towards the streets showed nothing but a pair of wire blinds, on which were emblazoned in gold letters, "Mr. Doombrown's offices." The interior presented an equally unsatisfactory appearance, for there was nothing apparent but a high, painted wooden screen, with little covered window about eight inches square in the centre while on the walls were hanging long slips of paper, with printed headings, on which were written the names of various horses in various races, with figures before their names showing the present state of the betting-market—something in the same way as the prices of stock are exhibited in the merchants offices about the Royal Exchange. It was not long, however, before the gallant Tom had explained to Mr. Verdant

process of making a bet and getting the "odds;" and our hero walked away, after paying five pounds to an invisible gentleman behind the screen, the possessor of a document something like this :—

DIDDLEBURY STEEPLECHASE.

MR. DOEMBROWN'S OFFICES

9999, STRAND.

£50

(Scratch'd or not)

The money to be paid the day after the race

P

CHAPTER THE THIRD.

Shows how Mr Alfred Verdant reverses the old Proverb, and how "the burnt child did NOT *dread the fire."*

'Now, my boy," exclaimed Tom Wido, when the pair emerged from the betting office. "I think we shall do. You see by the operation you have just concluded, that you are in a much better position than you were before. If the horse wins, you reduce your loss with the captain by fifty pounds.'

"And if it does *not* win?"

"Why then you lose five pounds more, that's all, my boy."

What a weary head it was our hero laid down upon his pillow that night, what a feverish day it was he rose too, after a troubled night invested it with Mr Doembrown's "market odds."

"I, Crossp't wins, I win a thousand!" he said to his friend, Wido, "to morrow will decide."

TO MORROW CAME AT LAST, AND CROSSPATCH WON THE RACE.

There was no little excitement among the members of the club that afternoon

"William," exclaimed our hero to the hall-porter, "call me a cab."

Up drove the vehicle, and off drove Alfred Verdant to the "offices" of Mr Doembrown, in the Strand. From a distance he could see a crowd around the door As he neared the spot, his impatience hardly kept itself within the bounds of propriety His heart beat quickly, and he kept saying to himself—"I am a made man! I am a made man!"

The cabman stopped, and drew up opposite the "offices." Alfred jumped out, and pushed his way through the excited crowd. There was a red flush on his face, which quickly turned to a deadly white He reached the doorway with intent to pass within. His hand was on the well-known knob, but the door yielded not to his pressure as of old He looked into the faces of they who stood around him. Some were flushed and angry and some were pale as his.

"What is the meaning of all this?" he said, in agony. "Let me know the worst at once."

"Well, then, the worst, sir, is—that DOEMBROWN HAS BOLTED!"

He heard the words, but knew not who the speaker was. The crowd appeared to reel about before him—strange lights seemed to flash across his eyes—his legs were powerless to bear him from the spot, and he sank down on the pavement of that very doorway a perfectly helpless and ruined man!

CHAPTER THE FIFTH.

Discovers Mr. Alfred Verdant in a very peculiar predicament, and brings his "experiences" to an unexpected close

How he got home, he never knew. For days and weeks he lay upon his bed, with none to tend him but a deaf old woman belonging to the house. At last, by very slow degrees, the fever left him, and when he was well enough to go out—well

afternoon, in company with a crowd of equally anxious adventurers who were feverish to learn their fate, and what a disappointed, gulled, and wicked fool he thought himself, when about six o'clock, he saw the written announcement put out upon the shutters with the name of his particular horse at *the bottom* of the list. There must be some mistake, he would say to himself, as he went up to the window again and again, and read the bill Of course there must he would inquire elsewhere Down Fleet-street he hastens Another anxious crowd about the window of another sporting newspaper. No, there are the very words again—

"Flatcatcher 1
coach
Sister to Harkaway
Slyboots a bad fourth."

There is no mistake; and Alfred Verdant, of Verdant Lodge, Fanoaks, is a miserable victim. He did not sleep that night sleep! it was not sleep, but a restless, tossing, feverish dream, in which the Captain and Wido and Doembrown successively mounted the "bad fourth," each with a loaded pistol in his hand

But Alfred Verdant paid the money like a man and a gentleman next day, though he was obliged to write to his mother by the evening's post for a further supply And his mother, dear innocent old soul, sent him up every penny she could spare from the housekeeping, and determined to wait another quarter for the silk gown she had promised to buy for herself.

But did the experience thus dearly bought bring any good with it? Not a particle. Under the tutorship of the gallant Wido, our hero was initiated into that most scientific mode of swindling, the science of betting, and in a little time he fancied himself quite clever at it. His visits to Mr. Doembrown's offices were repeated so often, that his face became well known among the followers of that respectable individual, and his name appeared in their several books—little leather-covered books, with metallic paper and a pencil, the marks of which will not rub out—for larger amounts than his good old mother and father ever spent in luxuries in all their lives.

He joined a club, too, of choice spirits, the members of which spent their mornings in bed, their afternoons in making bets in the dressing-rooms, and their evenings over the billiard-tables—who kept their horses and got their livings, nobody—themselves included—exactly knew how. Alfred Verdant, of Verdant-lodge, was beginning to be known as a very "fast young man" indeed.

CHAPTER THE FOURTH.

Initiates the Reader into some of Mr Alfred Verdant's dear-bought Experiences.

Our hero's adventures on the turf had not hitherto been very successful; but now a brighter day, he fancied, was about to dawn, and it really seemed as if he should recover all his former losses. True that, from a well-dressed, gentlemanly young fellow, whose arm any lady might have taken with credit, he had come of late to look more like a broken-down man-about-town than anything else. True, that his days were spent in feverish sleep, and his nights in vicious dissipation, true, that he had drained his mother's purse, and nearly spent his sisters' fortunes, true, for some weeks he had neglected to write to Fanoaks, and changed his lodgings so that they at home should not find him out. true, that he had had recourse to many dirty tricks, unbecoming a gentleman, and had been fleeced by older and more accomplished gamblers than himself. All this was true But only let him make this one grand *coup*, and he would retire from London for ever. Only let him touch the money which he would surely win by the next race; only let the horse he had backed with all the cash he could raise —and he had not hesitated to put his name to more than one piece of stamped paper in order to procure it—a not very difficult process, by the assistance of his friend Wido—and he would give up his bad courses at once and for ever. All the sporting newspapers prophesied that his horse must win,

enough to crawl from street to street—he looked like what he was—a broken, ruined spendthrift.

But his cup was not yet full. Before that he could take the lesson well to heart, it must overflow. He had heard nothing of his dear friend, Tom, since he was taken ill. What could it mean? He would write to him; and he would write, too, in the penitence of pain and suffering, to those dear ones at home. They surely never would forsake him in his misery. It was a sad world! How he had been deceived! How he had been victimised! He was thinking thus as he walked slowly down St. James's-street one sunny morning, when a rough hand was laid upon his shoulder. He looked round.

"I serve you with the copy of a writ for two hundred seventeen five, at suit of Thomas Wido, Esq. Here's the original," said the voice belonging to the hand. "Will yer go in a cab, or will yer walk? Plaintiff made his 'davit that you're about to leave the country."

Astounded, weak from recent illness, and scarcely knowing what he was about, Alfred suffered himself to be put into a cab, and before he had well recovered from his surprise and indignation, he found himself in safe custody in the house of Samuel Benjamin, of Chancery-lane, officer to the honourable Sheriffs of Middlesex.

* * * * * * *

A relapse; a long sleep, he knew not if it were of days, or weeks, or months, a returning sense of pain, a slow, very slow, consciousness of kind looks and words, a sort of dim recognition of the room in which he lay, and a grateful, child-like thankfulness for tender offices—how shall these weak words convey a sense of what he felt when once more safe at home at Fairoaks?

"Father, I have sinned against heaven and before thee," he whispered, as to himself, one day when a little group of loving faces was about his bed, "and am no more worthy to be called thy son."

"Hush!" said a white-haired venerable man, who stood at the bed's head, "there has been enough of reproach and sorrow for us all. I thank God that this my son was dead and is alive again, was lost and is found."

And then the little group closed round the bed; and, amid many tears and sighs, they offered up their prayers to HIM who has promised that the repentant sinner shall in no wise be cast out.

CHAPTER THE SIXTH AND LAST.

Contains the moral—a Cap which the British Public aforesaid may try on, and, if it fit, may wear

BRITISH PUBLIC, you are a good natured but a very careless body. You cannot in your daily walks—in your individual capacities from prince to labourer—but have noticed the alarming increase in those dens of iniquity, called betting-houses, especially in the neighbourhoods of the Strand and Fleet-street. You cannot take up your daily newspaper without reading of cases which call for immediate inquiry—here a young man committing deadly crime in consequence of the ruin brought about by these vile snares, there a report of what judges and magistrates have said in condemnation of the horrible system. You cannot kneel down at your bed-side at night without praying not to be "led into temptation," and yet you make no effort to stay this horrible distemper, and wipe away the plague-spot from your social life. Into the question of the *good of horse racing* we ask you not to enter *now;* but it were better that the whole sport—a *noble* one if you so like to call it—should be abolished at once and for ever, than that our youth should be demoralised, our virtue assailed, our worser natures appealed to, our comfort in life and hope in death destroyed, by the existence of these LITTLE HELLS. British Public, if you take no care of your sons and daughters, you must not be surprised if they grow up into bad men and worse women.

And now, oh British Public, we put it to you whether it is well to close your thousand eyes to the enormous wrong which these Betting Houses are inflicting on our youth. In the case of our friend Alfred Verdant, of Verdant Lodge, Fairoaks, we have seen that this system of allowed gambling was ruinous alike to his morals and his purse. But he had means on which to fall back, even though his pleasures were purchased at the price of his sisters' fortunes. Think what a horrible fate you are preparing for those who, unlike him, have no means but such as are obtained by the labour of their own hands. Think of the temptations which you put in the way of those whose principles are not yet fixed. Think of the homes you are doing your best to lay waste. Think of the prisons you are helping to fill. Think of the suicides to whom you are, as it were, proffering the deadly draught or the fatal pistol. Think of the widows and orphans you are daily making. Think of the sinners whom your worse than indifference in this serious matter encourages rather than deters. British Public, a portion of your body politic, the magistrates, have outspoken boldly in condemnation of the iniquities we have feebly hinted at; it is but for you, with your own mouth—in your workshops, at your family hearths, and by the mouths of your representatives in parliament assembled, to say the word, and these "little goes" of crime, these hotbeds of villany will be for ever abolished.

NOTES ON LISBON.

THE PORTUGUESE.

PERHAPS, when taken generally, no race of men on earth (calling themselves civilised) are more disgustingly ugly than the men of Lisbon. Short of stature, thick-set, squalid complexions, and eternally enveloped in their *capotas* (cloaks), they stalk along their filthy streets, at once an epitome of pride, laziness, and deformity, the whole appearance generally crowned with a tremendous cocked hat. This latter, indeed, is an appendage without which no Portuguese (in Lisbon), from the prince to the barber, the footman, the postillion, and the beggar, can possibly be induced to appear abroad, and many wear them constantly in their houses, as also their capotas. Their pride can only be equalled by their meanness—too self-conceited to work, even those *who call themselves gentlemen* do not blush to beg in the streets, and infest the coffee-houses, and every place of public resort, with their fawning, detestable whine of poverty, though even then they scarcely ever condescend to beg in their own names, but ask all for the love of God or some saint. Say to a beggar in Lisbon, "Here, carry this small parcel for me into the next street, and I will pay you for so doing," and in all probability he would abuse you, and tell you he was a Portuguese gentleman, and not a *gallego*.

The women of Lisbon may be said to be handsome. Their hair is generally very fine, dark, and abundant, and they take great care of it; their eyes, as beautiful as any in the world, black, or very dark brown, are expressive and melting. They equal Spain in the elegance of an exquisitely fine-formed leg, ancle, and foot, of which they are perfectly sensible, for their chief pride and ornament in dress seem to be directed to the stockings and satin slipper. Their hands and arms are in general very fine; the former delicate and tapering; the latter, from the shoulder to the elbow, partake, perhaps, rather too much of the general character of their person, which, for their height, inclines to the very limits of *embonpoint*. As a drawback, however, to so many charms, the Portuguese women are old at thirty, and before an Englishwoman is in her prime of beauty, they are gone by, and no more remembered, and certainly an old Portuguese woman is anything but an object of admiration. Their complexions may at all times be called sallow, though when young the clearness of the skin and the glow of health make it appear far from unpleasing; but in age it becomes actual parchment; in a word, a Portuguese woman, from fifteen to twenty-five, is a lovely object; but after that, however love may hold his sway in *their* bosoms, they certainly lose the power of communicating its influence to others. The Portuguese women are by no means remarkable for personal cleanliness, and their tempers are very bad; they are very ignorant and very superstitious, and consequently cannot make good domestic companions. They are so enslaved by a passion for dress, that many of very confined incomes literally deprive themselves and families of every domestic comfort, that they may, when they go abroad to pay a visit to the theatres, or to mass on particular saints' days, appear adorned with laces and jewels. They are remarkably careful in the preservation of their clothes; to that end, the moment they return from church or a walk, &c., they take off their finery, and very often the chemise and capota are the only articles of dress retained. Their dress suits often descend, with religious awe, to

the third generation. The greater number appropriate a particular suit to a particular day, which suit, consequently, sees the light but once a year. If a female in Lisbon has not an extensive wardrobe, but perhaps only *one* grand dress, and does not care to be always seen in the same, she will change occasionally with some female friend (equally circumstanced) one day, with a second another day, and so on, ringing the changes through half-a-dozen, or more, according to the extent of her acquaintance. Thus a woman that may be supposed to have a variety of elegant dresses has, in fact, but *one*, which one may be in their company, though not on the back of its owner.

The Portuguese, in many of their habits and customs, retain an opposition to every other nation in Europe. Every manual operation they perform backwards (relatively speaking). We stir our tea from us, with the sun; they, towards themselves, against the sun, then carpenters saw *from* themselves, the back of the saw towards the body; their farriers seldom, or rather never, unless by desire, bleed horses in the neck, but on the inner part of the thigh, and they shoe them in a very different posture to what we do, and it always takes two men to put on one shoe, though their horses are remarkably quiet. Corn is trod out by oxen—a custom which, though practised in some countries, is absolutely antediluvian. Their paviors use the paving-mallet the very reverse to us, by swinging it on the right side, and behind them, before they allow it to fall on the part to be rammed down. I could produce instances without number, in every branch of trade, of this perverseness, proving how backward they are in improvement, but will sum up the whole in stating what I saw one morning—namely, some scavengers actually employed sweeping a very steep street up hill, and against the wind, in very dusty weather. Obstinacy and perverseness personified could never beat this. Their fathers and grandfathers may have done so before them, but were not the less fools on that account.

WATCHING THE STREETS.

The watching the streets of Lisbon is one of the branches of the police of the city, and is most excellent for such a government as that of Portugal, but would not be submitted to by a people so jealous of every appearance of a military system as the English. It, however, deserves mention.

The Portuguese absolutely think it impossible that a man should be able to keep awake three hundred and sixty-five nights in the year, during all weathers, watch over their personal safety and their property, and, from this incredulity, they refuse to admit, or even to admire, our mode of watching our cities and towns: they, therefore, have established a perpetual military watch by day and night, the duties of which are performed by a regiment of foot soldiers, composed of the finest young men throughout the kingdom, they are mostly the sons of respectable farmers, and selected for their good conduct, and they think it an honour to be admitted into this regiment, which is better clothed and better paid than any one in the service. The uniform is blue and yellow, and they always appear extremely clean and neat. The officers are mostly from the first families, and those of the higher rank are noblemen. This regiment is also the guards of Lisbon, as it is the only one that attends on the royal family. The men are mostly superior to the generality of the people, there being few of them but what can read and write; they are quiet, and very mild and civil in the discharge of their duty, seldom abusing power, which is very great.

These men are stationed by detachments of from twelve to fifty men, or perhaps a company, in guard-houses in different parts of the city, from which they go in pairs, armed with a musket, bayonet, and sword, and perambulate the streets, &c., that lie within the district attached to their guard house. They are never stationary, but always walking about, day and night, and are relieved every two hours. As they have no fixed station (there being neither watch-boxes nor sentry-boxes, except at the door of each guard-house), so you never know but you have a couple of young, strong, active, and well-armed soldiers at your elbow; and it is astonishing to observe, if any disturbance takes place, which seldom happens, how the disputants will be surrounded instantaneously, as if by magic, by eight or a dozen of these men, who soon restore order, for the people stand in great awe of them. You can, at any moment of the day or night, collect a strong guard around you by shouting out, "*Aqui del Rei!*" ("Here, in the king's name.") It is thus their sole duty to preserve public tranquillity, and to watch over individual security, as also to apprehend all offenders against the laws; it is likewise their duty to turn everybody out of the coffee-houses and public-houses at ten o'clock at night, when they are obliged to shut up. They always attend in the theatres, in the churches (on saint-days, or on any occasion when they may collect a greater number than usual)—in short, they are everywhere. There are also a few troops of horse police, similar to our Life Guards, who also constantly patrol the streets in pairs.

FISH MARKET AT LISBON.

It consists of a few (say a dozen) open stalls by the side of the river, though on a raised pavement, with a wall of about three feet round it. These occupy two sides of a square on the east and south, and on them is the fish, which, though as fine as any in Europe, is the most disgusting sight imaginable, as it is never cleaned, but rather appears to be purposely rolled in slime and filth, and in that state you must purchase it and send it home, or go without. But this is not the worst part of the concern; for at the back of that part of the market which takes up the east side, at no greater distance than the thickness of the parapet wall (say two feet) lies a broad, but very shallow, paved ditch, intended to carry off the rain from the streets in the vicinity. This is open only to chance view, but you cannot avoid seeing it, and it is never for three minutes together unoccupied by the gallegos, fishermen, beggars, &c. Now, as it never rains in Lisbon in summer, and consequently this place is never cleansed, some idea may be formed of the disgusting sight and horrid stench.

In vain would you seek a remedy by going to a fishmonger's shop; they have no such thing in Lisbon, nor do they know what it means, and such a sight as Groves's, at Charing-cross, would, if transported to Lisbon, attract all Portugal to view it, through curiosity and wonder.

As, when divested of its filth, the fish is equal to any in the world, it might, perhaps, answer the speculation of establishing a fishmonger here, if the government would allow it, which is doubtful.

Among others that are very fine, may be mentioned the soles, white salmon, John Dory, *tainha*, or white mullet, the pargo, and, to those who can surmount prejudice, the chog; the prawns are uncommonly large and fine-flavoured, and the eels are not bad; the oysters, however, are abominable. But the staple is the *dinha* (a large species of sprat); it is rich and exquisite, and constitutes the chief food of not only the poorer, but of all classes of people, being also very cheap.

The clergy of Lisbon—if I recollect right, it is an exclusive grant to one convent, all the members of which are, and must be, of noble families—claim every tenth fish that is brought in, and no fisherman dares sell a single fish from his boat before he has brought them to market, and paid his tithe, which is collected in a most unjust and arbitrary manner. A man is appointed by these priests, who attends as the boats arrive, the owners of which are obliged to count all their fish out before him, one by one, and, while they are so doing, he selects at his pleasure every fine fish he sees (by means of a sharp hook which he holds for that purpose), he does not take every tenth fish promiscuously, but thus selects the best tenth of the whole cargo. As an amazing quantity of fish is brought to market, this tenth (which, after serving themselves, is retailed to hawkers and the stalls) must produce an immense revenue to the convent, or convents. When this tithe is thus selected, the poor fisherman, in return, receives a printed permit to dispose of the remainder, and the hawkers, who carry fish in baskets through the city, are obliged to purchase daily a permit for so doing.

PORTUGUESE SURGEONS.

The Portuguese surgeons are considered to rank very low, when compared with those of other nations; but they cannot be expected to excel in so difficult an art while they are deprived of the means of acquirement—hospitals, schools for anatomy, and dissections being unknown in the country.

One day, a very fine girl of eight years of age, coming from school, fell and broke her arm. An English surgeon was immediately sent for, but he being unfortunately from home, a Portuguese one was called in, who, to make assurance *trebly* sure, called in two others. This happy trio, perceiving that, from the fall, the flesh was turned blackish, determined that a mortification had

already taken place (in less than an hour, on a healthy young subject!) and, without any further ceremony, cut off the poor child's arm. The English surgeon who had been sent for in the first instance now attended, but only in time to lament his being from home when the accident happened, as he assured me there was not the least occasion for amputation, the fracture and bruise being no more than is usual in such accidents. Though I have here only cited one case, yet the practice is invariably the same. Off with the limb in all fractures, is with them what bleeding and hot water were with Dr. Sangrado—a universal cure. I know several persons who would have lost a limb, which they now enjoy the use of, but from the interposition of the gentleman above mentioned, or from their own resolution, which the Portuguese faculty call English obstinacy.

Nor is their skill in the other branches of their profession superior to that in surgery. They have no idea of difference of constitution in individuals, either from habit or climate. Old and young, robust and delicate, natives of warm climates, and those from the frozen regions of the north, are all treated alike. Balsams and glisters form the whole extent of their practice, and are alike prescribed in fevers, colds, gout, rheumatism, debility, repletion and all the opposites that "flesh is heir to."

So far are their medical men from possessing that humanity which [illegible] allow the whole human race to perish before they would put themselves to the least inconvenience. As a proof of this, a very particular friend of mine, whose son, a beautiful child about three years old, was dangerously ill, applied personally to four of the first reputed professional men in the city; but, it being in the middle of the day (July 31), they all refused to attend, till [illegible] alleging that the weather was too hot to stir out till then.

I have been told, and I believe it, that on one occasion a surgeon was requested to visit a man who had been stabbed through the body, but refused for a similar reason, saying, however, that if the wounded man would *come to him*, he would examine him. The *man died before he could* procure surgical aid.

MAGLIABECHI'S PRODIGIOUS MEMORY

MAGLIABECHI was born at Florence, on the 29th of October, 1633. His parents were of so low and mean a rank that they were well satisfied when they had got him into the service of a man who sold greens. He had never learned to read, and yet he was perpetually poring over the leaves of old books that were used as waste paper in his master's shop.

A bookseller who lived in the neighbourhood, and who had often observed this, and knew the boy could [illegible] what he meant by looking so much at the printed paper. He [illegible] that he did not know how it was, but that he loved it of all things, that he was very uneasy in the business he was in, and should be the happiest creature in the world if he could live with him, who had always so many books about him. The bookseller was pleased with his answer, and at last told him that, if his master was willing to part with him, he would take him.

Young Magliabechi was highly delighted, and the more so, when his master, at the bookseller's request, gave him leave to go. He went, therefore, directly to his new and much desired business, and had not been long in it, before he could find any book that was asked for, as readily as the bookseller himself. Some time after this he learnt to read, and from this time forth, whenever he could find a moment's leisure, he was found with a book in his hand.

He seems never to have applied himself to any particular study. An inclination for reading was his ruling passion, and a prodigious memory his great talent. He read every book almost indifferently, as it happened to come into his hands, and that with a surprising quickness, and yet retained not only the sense, but often all the words, and the very manner of spelling.

His extraordinary application and talents soon recommended him to Ermini, librarian to the Cardinal of Medicis, and Marmi, the great duke's librarian. He was by them introduced into the conversations of the learned, and made known at court, and he began to be looked upon everywhere as a prodigy, particularly for vast and unbounded memory.

It is said that there was a trial made of the force of his memory, which, if true, is very amazing. A gentleman of Florence, who had written a piece which was to be printed, lent the manuscript to Magliabechi, and some time after it had been returned, went to him with a melancholy face, and pretended to have met with a most unhappy accident, by which, he said, he had lost his manuscript. The author seemed almost inconsolable for the loss of his work, and entreated Magliabechi to try to recollect as much of it as he possibly could, and write it down. Magliabechi assured him he would, and, on setting about it, wrote down the whole manuscript, without missing a word.

By treasuring up everything he read in so strange a manner, or at least the subject and all the principal parts of the books he ran over, his head became at last, as one of his acquaintances expressed himself, "a universal index, both of titles and matter."

By this time Magliabechi was grown so famous for the vast extent of his reading and his amazing retention of what he read, that it began to grow common amongst the learned to consult him when they were writing on any subject. Thus, for instance, if a priest was composing a panegyric on a particular saint, Magliabechi would, on his applying to him, inform him what writers had spoken favourably of the saint, and in what part of their works the commendations were to be found, in some cases to the number of above one hundred authors. He would tell him not only who had treated of his subject expressly, but also who had only touched upon it accidentally, in writing on other subjects, both of which he did with the greatest exactness, naming the author, the words, and often the very number of the page, in which they were inserted. He did this so often, so readily, and so exactly, that he came at last to be looked upon almost as an oracle.

Latterly, he read the title-pages only, then dipped here and there into the preface, dedication, and advertisements, if there were any, and then cast his eyes on each of the divisions and different sections or chapters of the book, and thus he conceived the matter almost as completely as if he had read it at full length.

Magliabechi had a local memory, too, of the places where [illegible] book stood as in his master's shop at first, and in the Pitti and several other libraries afterwards, and seems to have carried this even farther than to the collection of books with which he was personally acquainted. One day, the great duke sent for him, after he was his librarian, to ask him whether he could procure for him a book that was particularly scarce. "No, sir," answered Magliabechi, "it is impossible, for there is but one in the world that is in the grand seignior's library at Constantinople, and is the seventh book, on the seventh shelf, on the right hand as you go in."

Although Magliabechi lived so sedentary a life, and studied so intensely, he arrived to a good old age. He died in his eighty first year, on July 14, 1714. By his will he left a very fine library of his own collection, for the use of the public, with a fund to maintain it; and the surplus, if any, to be given to the poor.

He was not an ecclesiastic, but chose never to marry, and was negligent even to slovenliness, in his dress. His appearance was such as must have been far from engaging the affections of a lady, and his face, in particular, judging from the representations of him in busts, medals, and portraits, would have rather prejudiced his suit than advanced it. He received his friends and those who came to consult him on any points of literature in a civil and obliging manner, though, in general, he had almost the air of a savage, and even affected it.

In his manner of living he affected the character of Diogenes; three hard eggs, and a draught or two of water were his usual repast. When any one went to see him, he was found lolling in a sort of fixed wooden cradle, in the middle of his study, with a multitude of books—some thrown in heaps, and others scattered about the floor—all around him; and this his cradle, or bed, attached to the nearest pile of books by a number of cobwebs. At the entrance of visitors, he was accustomed to call out to them not to hurt his spiders.

Thus lived and died Magliabechi, in the midst of public applause, and with such an affluence for all the latter part of his life, as very few persons have ever procured by their knowledge or learning.

His vast knowledge of books induced Cosmo III. to do him the honour of making him his librarian, and what a happiness it must have been to Magliabechi, who delighted in nothing so much as reading, to have the command of such a collection of books as that in the great duke's palace. He was also very conversant with the books in the Lorenzo library, and had the keeping of those of Leopoldo and Francesco Maria, the two cardinals of Tuscany.

And yet all this did not satisfy his extensive appetite, for he had read almost all books—that is, the greatest part of those printed before his time, and all in it; for it was latterly a general custom, not only among authors, but of the printers too of those times, to make him a present of a copy of whatever they published.

It is worthy of remark, that the Duke of Tuscany had become jealous of the attention he was receiving from foreigners, and those literary strangers usually went first to see Magliabechi before they called on the Grand Duke.

STATISTICS.

PARLIAMENTARY REPRESENTATION.—The following tabular view of the numbers of the population and houses in the several counties, boroughs, and towns of Great Britain returning members to parliament, according to the census of 1851, is made up from a return just presented to the House of Commons by the late government, as explanatory of the system which their Reform bill was intended to amend:—

	Total Male Population	Inhabited Houses.			
Bedford	59,533	24,505			4
Berks	81,381	33,278			8
Bucks	81,158	33,232		8	11
Cambridge	92,590	37,067		1*	7
Chester, N and S.	222,286	85,260		6	10
Cornwall, E and W	171,636	67,587		10	14
Cumberland, E and W	96,244	36,763	1	5	9
Derby, N and S	147,747	59,371	1	2	6
Devon, N. and S	269,583	98,387	4	18	22
Dorset	89,204	36,138	3	11	14
and S	196,550	64,977	4	6	10
N and S	185,190	73,571	4	6	10
Gloucester, E and W	217,822	86,771	4	11	15
Hereford	58,114	24,890			
Hertford	83,161				
Huntingdon	31,938	13,313			1
Kent, N and S	307,011	107,718			18
Lancaster, N and S					
Leicester, N and S	112,937	48,953			6
Lincoln, N. and S.	205,183	81,335			13

Wilts, N and S	126,027	51,778	1	14	18
Worcester, E and W	136,956	55,039	1	8	12
York (the three ridings)	1,797,667	450,225	6	31	37
Wales (the 12 counties)	496,159	200,087	15	14	29
Scotland (32 counties)	1,375,668	311,608	30	24	54

* Including the University.

THE METROPOLITAN POLICE.—It appears from the accounts respecting the Metropolitan Police Force, that on January 1 last, the number of persons belonging to the force was 5,519, consisting of one inspecting superintendent, at £600 a year, 18 superintendents, from £350 to £200 a year; 124 inspectors, with salaries from £200 to £81 18s a year. There were 587 sergeants, from £109 4s to £63 14s. a year, and 4,819 constables, comprising 1,250 in the first class at £54 12s a year, 2,319 in the second class at £49 8s a year, and 1,174 in the third class at £44 4s. a year. The sum paid for the police last year amounted to £422,296 5s. 4d., leaving a balance of £49,957 14s 5d., which were the receipts in the year. The fees, &c, from police courts were £10,548 15s. 8d. The commissioners of the Great Exhibition paid the force £17,426 2s 2d.

ENORMOUS FEES IN THE COURT OF CHANCERY.—The accounts relating to the Court of Chancery have been printed by order. The suitors'-fund account shows in cash £126,120 9s 2d., and in stock £3,832,117 8s 1d. In the year, stock was purchased with suitors' cash to £205,840 16s The following fees in the year ending the 24th of November last, amounted to £134,000.

We give some of the items as fees.—In the masters' offices the fees were £36,212 3s. 7d.; in the registrar's office £15,186 17s.; in the report office £3,613 6s. 5d; in the affidavit office £11,993 8s. 7d; in the examiner's office £986 5s. 4d., in the subpœna office £215 The fees by the secretary of lunatics were £3,992 1s 2d., by clerks to masters in lunacy £3,085 11s. 10d.; by taxing masters £26,380 10s 1d, by the clerk of enrolments £7,152 2s. 10d, by record and writ clerks £16,782 16s 4d; by the petty bag office £717 5s. 6d, and the fees received under the Winding-up acts were £256 8s

A MEMORIAL FOR THE PEACE SOCIETY.—An account of the number of guns and of pounds of gunpowder annually exported from the United Kingdom to the Cape of Good Hope, from the close of 1844 to January 1, 1852.—In the year ended the 5th of January 1845, were exported 2,002 guns, 229,550 lbs. gunpowder, 1846, 4,097 guns, 85,023 lbs gunpowder, 1847, 6,072 guns, 125,916 lbs gunpowder, 1848, 4,105 guns, 139,032 lbs gunpowder, 1849, 3,976 guns, 197,300 lbs gunpowder, 1850, 6,431 guns, 169,755 lbs gunpowder, 1851, 6,777 guns, 420,103 lbs. gunpowder, 1852, 12,180 guns, 144,790 lbs. gunpowder.

THE GRAVE OF SHIEL.—Within six miles of Templemore, but nearer to the county of Kilkenny, is a small village called Templetuohy, which the casual visitor never enters, and which offers nothing to excite the interest of a stranger, either as regards its local situation or the attractions of the neighbourhood. It is approached from the Kilkenny side through a wild and extensive bog, where, in winter, a chill mist obscures the view, and makes it impossible to keep warm, even if wrapped up in a Russian Dreadnought; and when, at length some avenues of dark fir are approached, it is found [illegible] only render the landscape

and begins to assume more of a beaten appearance, the fog gets lighter, the isolation is not so extreme, and, turning an angle, a low demesne wall to the left encircles a piece of rising ground, on which a comfortable but plain mansion-house stands The lands are evidently farmed by an experienced agriculturist, and without being separated by any walls or ditches, the various species of modern scientific labour are carried on in the one property. A short drive brings the wayfarer to the village of Templetuohy, the appanage of "Long Orchard," and the dulness of the place is relieved by nothing either in the way of business or gossiping The pigs that creep at rare intervals through the one street are more sedate and stolid than their kindred in livelier the policeman at the barrack seems as if nothing but a decent murder could excite his professional feelings into activity, and the yawn on the face of the sleepy huxter, whose imagination must have been originally very great to think he could drive a trade here, takes such an immense time in settling down that one begins to fear for the safety of the victim to commit. There is a parish church, a libel upon the art of Palladio, a mystery of ugliness, and without the charity of an ivy branch to cover its nakedness, and midway in the line of dwellings there is an opening or lane on the left, which requires the "open sesame" of a local [illegible] to bring a knowledge of the fact that this *cul de sac* is the site of a chapel The building is small, the ground darkened by some trees and enclosed walls, and, when I entered, the first and indeed only principal object that struck the view was a spacious area, protected by an iron fence and with a magnified headstone. There were two men down in a wide pit, and I feared to ask them what they were about, or for whom their offices were meant, remembering the courtesy of language of Shakspeare's clown, "Cudgel thy brains no more about it, for your dull ass will not mend his pace with beating." It was rather an anomaly that the greatest display of life should be in connexion with the churchyard, and that the only subject of interest in the village should be the grave. And this is truly so, for in this quiet and secluded spot the remains of the dramatist, the orator, and the statesman, were destined to pose, and within a week from the time of my visit had been transferred to Templetuohy all that is mortal of Richard Lalor Shiel! The gravedigger had his triumph when he, rudely moralising, said that his work made all classes equal, and yet there was a reverential tone in the way he alluded to the "big house" and to "the master that was gone"

ENGLISH QUARRELS.—"We might safely conclude," says French, in his "Study of Words," "that a nation would not be likely tamely to submit to tyranny and wrong which had made 'quarrel' out of 'querela.' The Latin word means properly 'complaint,' and we have in 'querulous' this its proper meaning coming distinctly out. Not so, however in 'quarrel,' for the English having been wont not merely to complain, but to set vigorously about righting and redressing themselves, their griefs being also grievances, out of this word, which might have given them only 'querulous' and 'querulousness,' they have gotten 'quarrel' as well"

MISCELLANEA.

REWARDS AND PUNISHMENTS APPLIED TO OPINIONS.—The only rational aim of rewards and punishments is to encourage and repress those actions or events to which they are applied. When they have no tendency to produce these effects, it is evidently absurd to apply them; since it is an employment of means which have no connexion with the end to be produced. In this predicament is the application of rewards and punishments to the state of the understanding, or, in other words, to opinions. The allurements and the menaces of power are alike incapable of establishing opinions in the mind, or eradicating those which are already there. They may draw hypocritical professions from avarice and ambition, or extort verbal renunciations from fear and feebleness, but this is all they can accomplish. *The way to alter belief is not to address motives to the will, but arguments to the intellect.* To do otherwise, to apply rewards and punishments to opinions, is as absurd as to raise men to the peerage for their ruddy complexions, to hop them for the gout, and hang them for the scrofula.

AN EXAMPLE FOR REASONERS.—Rev. Sidney Smith, in a letter on Sir James Mackintosh, says:—He had a method of putting things so mildly and interrogatively, that he always procured the readiest reception of his opinions. Addicted to reasoning in the company of able men, he had two valuable habits which are rarely met with in great reasoners; he never broke in upon his opponent, *and always avoided strong and vehement assertions.* His reasoning commonly carried conviction, for he was *cautious in his positions, accurate in his declarations, and aimed only at truth.* The *ingenuous* side was commonly taken by some one else; the interests of *truth* were protected by Mackintosh.

THE GREAT METROPOLIS.—In London, every man is so submerged in the multitude, that he who can hold his head high enough out of the living mass to be known, must have something of remarkable buoyancy or peculiar villany about him. Even parliament, except to a few of the leaders, is no distinction. The member of the shire is clipped of his plumage at the moment of his entering that colossal poultry-yard, and must take his obscure pickings with other unnoticeable fowl.

GREAT PRINCIPLES AND SMALL DUTIES.—A soul occupied with great ideas best performs small duties. The divinest views of life penetrate most clearly into the meanest emergencies. So far from petty principles being best proportioned to petty trials, a heavy spirit taking up its abode can alone sustain well the daily toils, and tranquilly pass the humiliations of our condition. Even in intellectual culture, the ripest knowledge is best qualified to instruct the most complete ignorance. So, the trivial services of social life are best performed, and the lesser particles of domestic happiness are most skilfully organised, by the deepest and the fairest heart.

TO PREVENT HICCUP.—Squeeze the wrist, preferably that of the right hand, with a piece of string, or with the forefinger and thumb of the other hand.

A BRIDLE FOR THE TONGUE.—It is certain great knowledge, if it be without vanity, is the most severe bridle of the tongue. For so have I heard, that all the noises of the pool, the croaking of the frogs and toads, are hushed and appeased upon the instant of bringing upon them the light of a candle or torch.

WORKING IN FAITH AND HOPE.—We live in a season of fermentation, which some deprecate as change—others hail as progress, but those who venture as they walk on their path through life, to scatter a few seeds by the wayside in faith and charity may at least cherish a hope that, instead of being trampled down, or withered up, or choked among thorns, they will have a chance of life at least, and of bringing forth fruit, little or much, in due season; for the earth, even by the waysides of common life, is no longer dry and barren and stony hard, but green with promise—grateful for culture, and we are at length beginning to feel that all the blood and tears by which it has been silently watered have not been shed in vain.

CURIOSITY OF CHILDREN.—The curiosity of the child is the philosophy of the ——, or at least, to abate somewhat of a sweeping generality, the one very frequently grows into the other. The former is a sort of balloon, a little thing, to be sure, but a critical one nevertheless, and pretty surely indicative of the heights, as well as the direction, to be taken by the more fully expanded mind. Point out to me a boy of ——d, or what would generally be called eccentric habits, fond of rambling about, a hunter of the wood side and river bank, prone to collect what he can search out, and then on his return to shut himself up and make experiments upon his gatherings—to inquire into the natural history of each according to its kind—point such a one out to me, and I should have no difficulty in pronouncing him, without the aid of physiognomy, to be a far better and happier augury than his fellow, who does not pore over his books, never dreaming that there can be any knowledge beyond them. Of such stuff as this were all our philosophical geniuses, from Newton to Davy, and so from the nature of things they must generally be. And no wonder. The spirit that is powerful enough to choose, aye, and to take its own course, instead of resigning itself to the tide, must be a very powerful spirit indeed—a spirit of right excellent promise.

SIR WALTER SCOTT'S TESTIMONY TO THE WORTH OF THE POOR.—I have read books enough, and observed and conversed with enough of eminent and splendidly cultivated minds, too, in my time, but I am sure you have heard higher sentiments from the lips of the poor, uneducated men and women, when exerting the spirit of severe, yet gentle heroism, under difficulties and afflictions, or speaking their simple thoughts as to circumstances in the lot of friends and neighbours, than I ever yet met with out of the pages of the Bible.

INTELLIGENCE.—The divine gift of intelligence was bestowed for higher uses than bodily labour—than to make hewers of wood, drawers of water, ploughmen, or servants. Every being, so gifted, is intended to acquaint himself with God and His works and to perform wisely and disinterestedly the duties of life. Accordingly, [illegible] see the multitude of men beginning for knowledge, for intellectual action, for something more than animal life, we see the great design of nature about to be accomplished; and society, having received this impulse, will never rest till it shall have taken such a form as will place within every man's reach the means of intellectual culture. This is the revolution to which we are tending; and without this, all outward political changes would be but children's play, leaving the great work of society yet to be done.

ANSWERS TO CORRESPONDENTS.

J. DORE.—The Colossus of Rhodes was thrown down by an earthquake, B.C. 224. It was made of brass, and weighed 713 000 lbs. Rhodes was taken by the Saracens, and the Colossus sold, A.D. 659.

A. B. C.—Your sentence is grammatical, but we should rather say "This man is better fitted for the office than the other."

J. P. may take our word for it, first, that barley, after being made into malt, will *not* grow so as to produce a crop if sown in a field." And, secondly, that "the process of analysing half a pint of beer will *not* increase the quantity of alcohol therein contained." The "respectable brewer," who, "at a temperance meeting in Buckinghamshire, stated that malt would grow, and alcohol increase in quantity, under those circumstances," was an ignoramus.

A. MOINTLY.—Our heavy troops at the battle of Waterloo had no defensive armour, nevertheless, they proved more than a match for their steel-cased antagonists. A committee of the House of Commons sat to consider the best sort of defensive armour for the heavy dragoons; and a stalwart life guardsman, who had borne his part in the bloody field, was asked what armour he should like to wear if he had another day's work of the same kind. The answer was as naive and unexpected that it quite upset the gravity and warlike predispositions of the committee—"I think I should prefer being in my shirt sleeves."

W. D. may make excellent bread without "brewers' yeast" by attending to the following directions.—Take two ounces of carbonate of soda, one ounce and a half of tartaric acid, and a piece of salammoniac, about the size of a hazel nut, all powdered. Let these be well mixed in *a perfectly dry state.* Then blend them *intimately* with half a peck of dry wheaten flour—or you may use one-third barley flour—and about two ounces of salt. Make a deep hole in the middle of the flour so prepared, and pour in as much *cold* water as will make dough somewhat less stiff than bread dough is usually made. *Mix it quickly and well.* Make this quantity into three loaves, put them *immediately* into a *quick* oven, and let them bake one hour and ten minutes. The *exact* time will depend, of course, upon the heat of the oven, but a very little practice will determine the right length. You will thus have three loaves of sweet, palatable, nutritious bread, without the waste attendant on using brewers' yeast.

UN VIEUX AMI.—You had better not perplex yourself with "the mystery of the Trinity."

WILLIAM SLACK *may* expect to find "the subject of logic" treated in the forthcoming "Popular Educator."

W. D. will find the following a refreshing and pleasant drink to use at hay and harvest times.—Boil one ounce of good hops and one ounce of bruised ginger in two gallons of water for about an hour; strain the liquor off, and sweeten with two pounds of treacle. When cold, put it into a stone bottle. It should be made in the evening, and it will be fit for use the next morning. It should be made every three days. The strength of the hop must be suited to the taste. The ginger may be omitted if desired.

A WELLWISHER will find simple, easy lessons in drawing at most respectable stationers'.

DETROIT asks, "What books ought a youth to study to become qualified for an editor?" An editor of what? Studying all the books in the British Museum would scarce suffice to "qualify" for some editorships.

A COUNTRY READER.—Lessons on "Plane Geometry" will, no doubt, be given in Mr. Cassell's new work, "The Popular Educator."

A MONTHLY SUBSCRIBER.—We cannot undertake to furnish the designs you require.

BONUS PUER.—Your remarks are judicious; they shall be borne in mind. We say the same to F. O. Pearce.

W. S. (Canterbury.)—We do not think the clerks or drapers' assistants would improve their circumstances by emigrating either to San Francisco or Melbourne. Labourers and artisans are the persons required in both those colonies.

EGYPT: ITS EDIFICES AND ITS PEOPLE.

II.—THE CITY OF CAIRO.

ALEXANDRIA, which has been already described, is situated on the western side of the Delta, or territory on the coast, at a distance of some fifty miles from the Rosetta mouth of the Nile, and about the same distance from the point where it is now connected by means of the Mahmudieh canal with the great river of Egypt.

The scenery along the banks of this canal is, on the whole, rather uninteresting and monotonous. The villages scattered here and there present a strange aspect, and the fellahs

COFFEE HOUSE ON THE BORDERS OF THE NILE.

appear to be truly miserable. There are, however, occasional spots of brightness and even beauty to be found. The verdant fields of grain, the beautiful orange-grove, the gardens abounding in vegetables and flowers, the stately palm, the acacia or locust tree, the picturesque country residence or villa of some wealthy citizen, are reliefs to the general tediousness of the canal-passage, which delight all the more from their infrequency, and help the traveller to forget what he cannot but deplore.

The first view of the Nile must, under any circumstances, be interesting. It is so intimately connected with ancient history, particularly of that people whose monuments have excited so much wonder and astonishment for ages, and it is in itself a river so marvellous for its length, size, periodical inundations, and many valuable qualities, that hardly any one can gaze upon it for the first time without emotion, or glide over its broad bosom without a crowd of recollections of the mysterious past. In consequence of the strength of the current, which usually runs at the rate of nearly three miles an hour, the progress of a steamboat is necessarily slow and laboured; and as the channel frequently shifts its place, and banks of sand are deposited in those spots where deep water formerly stood, the navigation of the Nile is neither very easy nor very safe for vessels proceeding at a rapid rate. Not unfrequently does the experience of the oldest and best informed pilot fail him, and it often happens that boats get aground, and remain some time in a position the most annoying possible for a traveller.

The scenery along the river, from Atfeh to Bulak, a distance of about a hundred and twenty miles, is interesting, more from its peculiarly oriental character than from any variety or striking characteristics which it possesses. The mud huts of the peasantry, the groves of palms, the fertile fields of grain, the uniformly degraded appearance of the people, combined with their light-heartedness and cheerful submission to a state of things which we should consider intolerable, are all peculiar to the East, and consequently full of interest to a stranger. One can hardly fail, too, to be struck with the evident richness of the country, and its capacity to furnish not only means of support, but even wealth to its inhabitants, were not the oppressive hand of the despot laid upon everything within his grasp, and the curse of monopoly spread over the whole land. Sailing along, the active boatmen of the Nile are seen busily engaged in their occupations, singing and shouting, and spending much labour in accomplishing little work, as is usual in Egypt. On the low banks of the river, or some shoal place, appear flocks of various sorts of birds—pigeons, ducks, herons, &c.; and now and then a vulture or a falcon-kite will sail slowly by, or hover for a few moments overhead, as if waiting for its accustomed prey. Occasionally, too, the white dome of some Mohammedan saint's tomb will strike the eye as one of the few picturesque objects in Egyptian scenery, while the means are singular by which the water of the river is raised to a sufficient level to irrigate the fields. The "sákieh" mainly consists of a vertical wheel, which raises the water in earthen pots attached to cords, and forms a continuous series, a second vertical wheel fixed to the same axis, with cogs, and a large horizontal cogged wheel, which, being turned by a pair of cows or bulls, or by a single beast, puts in motion the two former wheels and the pots. The construction of this machine is of a very rude kind; and its motion produces a disagreeable creaking noise. The "shadúf" consists of two posts or pillars of wood, or of mud and canes or rushes, about five feet in height and less than three feet apart, with a horizontal piece of wood extending from top to top, to which is suspended a slender lever, formed of a branch of a tree, having, at one end, a weight chiefly composed of mud, and at the other, suspended to two long palm sticks, a vessel in the form of a bowl, made of basket work, or of a hoop and a piece of woollen stuff or leather: with this vessel the water is thrown up to the height of about eight feet into a trough hollowed out for its reception. In the southern parts of Upper Egypt, four or five shadúfs are required, when the river is at the lowest, to raise the water to the level of the fields. There are many shadúfs with two levers, &c., which are worked by two men. The operation is extremely laborious.

Continuing to ascend the Nile, Cairo, or *El-Kahireh*, the "city of victory," is reached, one of the most interesting and purely oriental cities to be met with in the East. In size and extent, in the number of its population, in its importance as the metropolis of Egypt, it holds the first rank; and in those peculiarities which distinguish it from European cities, or such places as Alexandria, partly Arabic and partly Frank, it presents to the traveller a field for observation which can hardly be found anywhere else.

And now let the reader imagine that he is standing at a window of the Hotel d'Europe, gazing upon the panorama which constantly passes before the eyes. He is looking out upon the Ezbekiyeh, a large park or plot of ground, [illegible] with trees and arranged into walks; it is irregular in shape, being about half-a-mile in extent either way, and it winds, as it were, for a considerable distance, both right and left; the flowers and fruit-trees, and the shady walks, make it a delightful place of resort for those who are fatigued or annoyed with the bustling, noisy streets. In former times this whole space was a lake, during the season of the high Nile; but a large canal which surrounds it, and at present is dry, has drained it, and not only removed a disagreeable pool of stagnant water, but furnished to the Cairenes a beautiful public square and garden. The principal street only is wide enough for vehicles of any size to pass and repass, and most of the hotels for foreigners are collected together in this locality. It will be readily seen how great an amount of travel on foot and on horseback, on donkeys and in carriages, must here take place during the day.

Very early in the morning, the donkey-boys assemble with their useful steeds on the opposite side of the street, and keep a sharp look-out upon the doors and windows of the hotel; every once in a while they make their salamat (the usual "how-d'ye-do") to some passenger who has patronised them the day before, and endeavour to prevail upon him to engage for an indefinite period an animal which has perhaps shaken him almost to death, or has other and equally valuable qualities. Near by, under the same trees where they keep themselves, is a fellahah, squatted on some stones, with large trays of dates spread out before her; she appears to have one of the ugliest faces which are to be met with in the streets, and just in this proportion does she seem to be careful to cover it with her dirty "burko," or face-veil. Nevertheless, she has her customers, and the palatable cheap fruit which Egypt furnishes in such abundance enables many a fellah and poor boy to enjoy himself at a very small cost. At this hour, too, one of the hard-working and poorly-paid water-carriers, with a very large goat-skin full of water, goes to and fro in front of the hotel, and liberally dashes its contents upon the dusty street, so that instead of dust there is now mud—a choice of evils, but which is to be preferred it is difficult to tell, even after having effectually tried both.

As by the requirements of their religion the Mohammedans are early risers, so that they may say the appointed morning-prayers, many persons are astir very early, and business of various sorts begins to be transacted. Now comes ambling by on a donkey a Copt (or Christian), distinguished by his deep blue or black turban, and hastening to his daily occupation. Like most of his brethren, he appears to be a scribe, for stuck in his girdle is the dawáyeh, or oriental inkstand and receptacle for reed-pens, and under his arm or in his hand are some paper and blank-books for present use. Now a fat, lazy-looking Turk rides along, at a slow pace, casting looks of scorn or contempt upon the peasantry and others whom he meets or passes, and doubtless on his way to some greater man than him he is, to whom he can and will cringe and bow with all that [illegible] renders the eastern character so often despicable in the eyes of other people. Now, others, of all classes, ages, sexes, and colours, from the deepest black to the palest white, pass our window; some have turbans of manifold colours, red, white, black, parti-coloured, &c. Some wear dresses of different descriptions, half Turkish, half Egyptian, partly Frank, partly Greek, some English, some French, more nondescript.

Here are women in veils and drawers, with yellow boots and slippers, there are women without covering to the face, with bare feet and legs, and having only a blue shirt of cotton; and mingled with all are boys and girls, dogs and donkeys, camels and horses, carts and carriages, sheep and goats, the gaudy splendour of some government officer, and the ragged penury and filth of some miserable fellah; the concubines and wives of the rich man, astride of asses and guarded by eunuchs; the half naked peasant-woman seated in like manner upon her load of vegetables, and a plentiful supply of importunate beggars, and many such-like curious sights.

As the morning advances, the scene changes somewhat, frequently Europeans are seen in the street, moving about with all that freedom and utter indifference to the liking or disliking of the Turks and others which characterise them; as they do not understand, so they do not care for, the muttered imprecations which are every now and then bestowed upon them by some bigoted Mohammedan, who only wants the opportunity to use fire and sword with as great fury as was ever done by any of the followers of the Arabian impostor.

About mid-day, a tremendous cracking of a whip by a groom on foot, and an unceremonious dispersion of the people on all sides, announce the approach of some one greater than ordinary; see, now, horsemen in elegant or showy trappings, with various appurtenances of a magnate's public appearance, are prancing slowly along; next comes a carriage and six, with the pasha inside, who bestows occasionally a nod or something of the sort upon the passers-by; following his carriage are a number of horsemen and others who form his suite; and these as well as himself, require the utmost deference and respect, and while the whole cavalcade is going by, no one must dare to get in the way or move out of his appointed place; for it only requires a significant motion of the pasha's eye or hand to dispose of any unlucky fellow's head, or appropriate his

heels to the horrible bastinade—such is the despotism of Egypt! Occasionally, too, other carriages, preceded in the same way by a groom, running ahead with a large whip, pass the window, and by the show which they make give the beholders an idea of the consequence which belongs to the respective consuls and consuls-general of foreign powers; or impress the common people with a salutary reverence for some of the pasha's officers who move to and fro in these novel vehicles. Listen, for a moment: what an uproar and disturbance in the street; what furious gestures, what shouting and screaming, what fast talking and fiery war of words,—and what do you suppose it is all about? Why, not a revolution, not a shouting for "equal rights," or "down with the pasha," but nothing more nor less than which one of the donkeys or boys shall gain possession of a Frank who has just appeared at the door of the hotel: see what a crowd of boys with donkeys now he is pushed toward one, now another, now between two, lifted by main force upon a donkey, and now some opposition brute is all but thrust betwixt his legs; this boy shouts, that half-grown man screams, another praises the saddle of his donkey, a fourth beseeches the gentleman to try his beast, a fifth falls foul of number two, a sixth begs number three and his donkey—and so they go, [illegible] all known languages, and several that are not known, upon the poor European at last gets on to one of the steeds, and the tempest subsides, only to be renewed again at the first [illegible]

As the day wanes, similar scenes at [illegible] ets present the same appearance of crowding and jostling, of threading one's way amid camels, with heavy, wide-spreading loads, and donkeys with panniers filled with stones or vegetables, or laden with water-skins or great bundles of grass; of escaping from being run down by a horse, and narrowly missing being crushed by a cart against the side of a house, of pushing your neighbour out of the way, and being as unceremoniously used by some one else, and such like. Just listen to the donkey-boys, as they beat their little brutes and warn pedestrians to get out of the way "*yemeenak! shimalak!*" (to thy right! to thy left!) "*dahrak!*" (thy back!) "*rushshak!*" (thy face!) "*gembak!*" (thy side!) "*rijlak!*" (thy foot!) "*kaabak!*" (thy heel!) Hear them call out to a Turk, "*saïm!*" (take care!) to a Frank, "*ya khawage!*" to some poor woman, "*ya bint!*" ("daughter" or "gal"), to an old man, "*ya sheikh!*" &c.* The street is full, very full, as it would seem, having no sidewalks to protect the pedestrian, but all being in common; the various classes, ages, and sexes use such part or parts of the street as they can find; and it is wonderful to notice how seldom an accident happens, how unfrequently any one is hurt, how well, on the whole, everybody manages to get along, and both to give and receive his or her share of jostling and pushing, without offence being meant or taken.

Towards evening the scene changes again, and as night draws on, the donkey-boys, the old woman with her dates, the venders of other articles of food, the idlers and loungers, the dogs and monkeys with their masters, and the whole tribe of street-walkers and travellers gradually retire, and the thoroughfares become vacant and lonely. In the hours of darkness hardly a person can be found in the busy avenue of the hotel, from the windows of which we have been looking. Occasionally one passes by with a lantern in hand, to save him from harm in picking his way where no light is furnished by the authorities; and during the evening and night nought else is seen, and scarcely anything is heard save the annoying bark of some mongrel curs, as if they were taking revenge for the contempt with which they have been treated during the day.

Eastern cities have, however, many features in common with each other; and, unlike what prevails in some other parts, the streets or lanes are very narrow, winding, unpaved, uneven, and dirty to an extreme. The houses are built to suit the climate and the religion of the people, and externally have hardly a single mark of beauty or good taste, excepting always many of the projecting latuce-windows, which are often very pretty. Heaps and mounds of rubbish meet the visitor at various points, and he is both astonished and annoyed at finding such things in the heart of a great city almost as a matter of course. The places of business and trade are in various quarters, and are styled bazaars, where articles of all sorts are sold; and the merchants spend their time, with pipe in hand, chatting with a customer, displaying their goods; and, sitting with their legs drawn under them, lead a life of indolence and inactivity. These and other characteristics of the same kind, belong to nearly all oriental towns, and are more or less familiar to every one who has taken any interest in eastern matters. Let us, then, sally out in good season, and take a look at some of the many strange and curious things to be seen in the streets and lanes of the metropolis.

Turning to the right on leaving the Hotel de Europe, we soon arrive at another quarter of the town. We enter through a large door, which at night is shut and guarded, and find ourselves in a narrow, crooked lane, hardly wide enough for one on a donkey to pass, and having a very poor appearance and a damp atmosphere. It is the Copt quarter where we are, the Jewish quarter we shall find to be much worse, and the Turkish a very great deal better. Observe the change in the aspects. Here they are about five or six stories high, and sometimes more; less, and the little shops on either side, with the women squatted in the midst of their dates, or vegetables, or groceries; the men shouting forth their articles of trade, the children playing under foot, the slippery mud and filth in which we are treading impress one very singularly and far from pleasantly. One does not wonder that plague, cholera, and pestilence, in general, rage in Cairo. The only surprise to those educated in the belief that cleanliness of person and habitation, and the circulation of pure air, are essential to the health of the community, is that the plague should ever leave such a fair field for its operations as this, or that the cholera and pestilential fevers should not sweep away the whole population during the period of their ravages. Notice how scanty is the supply of light, though it is noon-day and the sun is shining in all its vigour. The interior of the petty shops is quite dark, and it is not without difficulty that you can distinguish any objects at all. If you look upward for a moment, you discover that it is not altogether the narrowness of the street or lane which causes this sort of twilight; for there you see how the windows and upper storeys, in many cases, project beyond the perpendicular, for two feet or more on both sides of the passage, which, of course, diminishes the space so much, that neither the sun nor the light can penetrate with any great effect. We leave this lane at this point, and turn down another, which, amusingly enough called "Broadway," goes at one time under portions of houses, and is quite dark, and at another becomes quite wide, i. e., some seven or eight feet, which appears well by contrast. Now, we see houses in ruins, and the rubbish in the middle of the street, as is sometimes the case in *our* part of the world. Now we pass along without meeting a single individual, now we meet a crowd of boys and donkeys; a number of veiled objects, which appear to be of all colours and ages; and a string of camels, with immense loads, which require the pedestrian to take shelter in a doorway, or where he best may, to avoid being crushed, as they stalk slowly by. And thus we continue, turning in and out, up and down, meeting all sorts of curious things, coming in contact with all classes, from the gaudily dressed lady, who flies along in silks, to the most miserable fellah woman, who wears merely half a blue shirt to cover her nakedness, and who is child devoid of clothing astride of her shoulder. And though, at times, in crowds and thoroughly jostled, yet often we are quite alone, and surprised to see how few people are in the streets and lanes of the city.

But let us enter a house; it is the mansion of a friend, yet in nearly all respects is like other houses in Cairo. At the door, or just inside, stands the porter who admits us. You see there is a small court, which in many cases is much larger, and has a well and some other things in it, but as yet there is no appearance of life or of inmates, and only blank walls and an earthen floor, which do not seem to produce much. We follow the sober Arab, who moves at just such a pace, and rejoices in the name of Mûsa, and he leads us up a staircase of stone steps, which wind at every third or fourth step during the whole ascent. It is lighted from above, being open to the sky. By and by, we get to the third storey, as we should call it, and leaving the stairs enter a broad

* Lane's "Modern Egyptians," vol. i. p. 209.

space paved with stone, and having doors leading to rooms on either hand, and those again communicated with others on the same floor In this particular house there are various things which indicate European habits and tastes. the drawing-room is furnished with chairs, and has a carpet on the floor, together with many objects which could only interest a Christian and a lover of English literature, and the various other rooms, while oriental to some extent, still show that habit is a strong thing, and that our customs may not easily be dispensed with, but in general, as you will notice in other houses where eastern manners are adopted the rooms are not at all furnished in this way the stone floor is covered sometimes only in part, with plain white matting and at one end of the apartment which is nearly square is a long and broad divan, raised about six inches above the floor, reclining on

THE SHADUF

larly some of the ladies who have visited Egypt will have favoured the world with the results of their intercourse with eastern females.

While here, it is worth our while to mount still higher, and from the flat roof or terrace, to observe what an appearance Cairo presents A similar winding staircase leads to this attractive spot as the citizens usually esteem it, for here, in the cool of the morning and evening, they love to assemble and enjoy the delightful breezes which refresh and invigorate the wearied body and jaded spirits, here they have their pipes and coffee, and reclining on their divan or carpets, spend hours in contemplation or cheerful conversation, as best suits their taste Look now at the unique scene which lies before you In the distance you see the lofty pyramids of Gizeh—those mighty monuments of a people and an age which have long since passed away for ever, and far beyond, the illimitable desert and hills of sand which bound the view on the African side Opposite to these, looking eastwardly, are the Mokattam hills or mountains, which stretch away to the south and run into the Arabian desert Mingled in one picturesque outline you see the broad and winding Nile, which confers life upon Egypt and renders verdant its productive banks, the vast collection of splendid tombs and mausolea for the dead of past generations which serve to remind one of the certainty of death and the decay of all things human the beautiful palm groves the numerous villages, the broad fields of grain, the gardens and residences of the great, the manufactories of the pasha's introduction, and such-like features which, under the brilliant sun and the transparent skies of Egypt, have an effect which is peculiarly their own But there are several elevated spots where this same scene, slightly varied in

THE DONKEY DRIVER

tirely across the room and having pillows against which to recline. Very few articles of any kind are to be seen, seldom a chair, usually a small table or escritoire; but very seldom is there an approach to the profusion of furniture which characterises our parlours and drawing rooms and at first one cannot but feel that it is cheerless and uncomfortable, but use, and the necessity of studying how best to pass the hot season, accustom one soon to these changes You will notice too, in the house where we are that there is no harm and of course no portion of it set aside as forbidden to any but the husband and female visitors, in others, where Europeans choose to adopt this custom likewise, the apartments of the women form an important portion of the house—a portion which several writers have admirably treated of particularly

our notice on many counts In the streets and lanes, it is very difficult to form any idea of the actual state of the houses in which people live, or of the strange appearance which they present when seen from a high position, as ours is, but here we look down upon such things as we could not have supposed to exist in a large and populous city like the metropolis of Egypt Observe the air of desolation which seems to envelop every object, the houses are very generally partly in ruin and being built of the dark-coloured bricks formed of the mud of the Nile, look still less inviting than would otherwise be the case Crowded together, and having few avenues wide enough to be distinguished, were it not for the relief which the minarets afford to the scene, the dwellings of the people would in general strike one as little better than those in the villages In

BIRKET-EL-FIL, OR THE LAKE OF THE HIPPOPOTAMUS.

short. Cairo looks like a city in ruins, and the reality is probably not very far behind the appearance.

Before returning to our hotel, let us go into the bazaars, which are in many respects the most interesting objects in the city, and will well repay us for an hour or two spent in examining them. Most of the streets, especially the larger ones, have a row of shops on either side, and, as you will observe, certain portions of the city are devoted to some particular branch of trade or manufactures. Thus, there is the market of the copper-ware dealers, the jewellers' market or bazaar, that of the hardware merchants, of the sword-mounters, of the silk-dealers, of the perfume-sellers, of the gold and silver-workers, &c. It will be quite impossible for us to do more than look at one of these thoroughly, let us then go to the great Turkish sook or bazaar, termed "Khan El-Khaleelee," from the sultan Khaleel, in whose reign it was built, A.D. 1292, and we shall obtain probably the best idea which Cairo affords of an oriental bazaar. It consists of a number of short lanes, connected with each other, and has four entrances from different quarters. The shops are on both sides, and are worth stopping to look at, and to contrast with the large brilliant shops of European cities A square recess or cell, about seven or eight feet high, and about half that distance in width, with narrow shelves for the articles offered for sale, constitutes a shop in the "Khan El-Khaleelee." In front of the shops you observe that there is a raised seat of stone or brick, built up to a height even with the floor—that is, about three feet above the ground. This seat is about a yard wide, and having a carpet spread over it, with a cushion to recline against, is used by the shopkeeper as well for his own purposes as to accommodate a customer with a pipe and means of resting during the tedious process of concluding a bargain Several of the bazaars are covered over with matting laid on loose reeds, or supported by more solid planks, extending across the street, at a slight distance, usually, above the houses.

Notice, now, for a moment, what is passing before our eyes; crowds of people are constantly moving along, some having come to buy, and some merely to look, different cries shouted in our ears by those who vend articles about the streets; women of the lower classes are haggling with the shop-keeper about some trifling purchase, ladies in silks and satins are stopping to examine some jewellery or ornaments, where not only the bijouterie attracts their attention, but something else in the merchant himself—a circumstance which strikingly reminds one of the Arabian Nights, and the love stories in them based on the visits of ladies to the bazaars, on the mastabah, or raised seat, at various shops, are customers, who, having taken off their shoes and drawn their feet under them, are gravely smoking a pipe or drinking coffee, as a necessary part of making a purchase; or having concluded those operations, are soberly discussing the value of the article, and what may be considered a fair price, some of the shops are empty, the master having left his property to the care of his neighbours, who in general thus aid one another; in one or two places the merchant is very devout, and is saying his prayers upon the mastabah, in the sight of every body, according to the custom of the Turks and other Mohammedans; and mingled with all are foreigners from nearly all nations, and persons of all colours, which form a medley rather curious and interesting. As we stroll through this extensive bazaar, we see that a great variety of articles are on sale; such as ready-made clothes, arms of different descriptions and qualities, the seggádehs or prayer carpets, silks, linens, muslins, pipes, amber mouth-pieces, copper-ware, &c. &c.

As a fitting close to these scenes, a passage or two may be quoted from Mr. Lane, in illustration of some of the many and various cries heard in the streets of Cairo; they are sufficiently curious and peculiarly oriental to merit attention; "The seller of sour limes cries, 'God make them light, (or easy of sale)! O limes!'—The toasted pips of a kind of melon called 'abdallawee,' and of the water-melon, are often announced by the cry of 'O consoler of the embarrassed! O pips!' though more commonly by the simple cry of 'Roasted pips!'—A curious cry of the seller of a kind of sweetmeat ('halaweh'), composed of treacle fried with some other ingredients, is 'For a nail! O sweetmeat!' He is said to be half a thief: children and servants often steal implements of iron, &c., from the houses in which they live, and give them to him in exchange for his sweetmeat.—The hawker of oranges cries 'Honey! O oranges! Honey!' and similar cries are used by the sellers of other fruits and vegetables, so that it is sometimes impossible to guess what the person announces for sale, as when we hear the cry of 'Sycamore figs! O grapes!' excepting by the rule that what is for sale is the least excellent of the fruits, &c., mentioned, as sycamore figs are not so good as grapes. A very singular cry is used by the seller of roses: 'The rose was a thorn; from the sweat of the prophet it blossomed.' This alludes to a miracle related of the prophet.—The fragrant flowers of the henna-tree (or Egyptian privet), are carried about for sale, and the seller cries, 'Odours of paradise! O flowers of the henna!'—A kind of cotton cloth, made by machinery, which is put in motion by a bull, is announced by the cry of 'The work of the bull! O maidens!'"*

The lake of Birkit-el-Fil, or of the Hippopotamus, of which we give an engraving, is at Cairo. In Egypt there are several other pieces of water called lakes, but they are more properly basins, and strikingly resemble those that skirt the shores of Persia They are all shallow, are separated from the sea with which they communicate, by a narrow bank or ridge of sand; and are in the course of being gradually and slowly filled up.

* "Modern Egyptians," vol. ii. p. 18.

NOTES ON VARIOUS TRADES.

CLOCKMAKERS.

In the year 1368, king Edward III. invited three clockmakers from Delft to settle in England. Their names were John Ummam, William Ummam, and John Latuyt.

Barrington thinks it probable that there were clockmakers, or persons who at least pretended to understand clockmaking, in England for the royal protection given to the three Dutchmen directs that the artists to whom it is granted shall not be molested while they are engaged in this employment.

CLOCKS.

Leland states that about the year 1336, Richard de Waling ford, abbot of St Albans, made a clock which represented the revolutions of the sun and moon, the fixed stars, the ebbing and flowing of the tides, and many other lines and figures. This clock was, in Leland's opinion, not only the most wonderful instrument ever seen in England, but in Europe. It was called Albion by its maker. The abbot was the son of a smith, who lived at Walingford His clock continued to go for upwards of 240 years

Chaucer mentions clocks as if they were not uncommon. To show the certainty of a cock's crowing, he says—

"Full sickerer was his crowing in his loge,
As is a clock or any abbey orloge."

In the late Exhibition were shown a great variety of clocks of curious construction, some of them made to go without winding up for many years The turret clock, made by Mr. Dent, which stood in the central western nave, has been purchased for the use of a factory in the north, and the church clock, constructed by Mr. Bennett, of Greenwich, is intended to be erected on London bridge, midway between St. Saviour's church and the railway station. It will have four illuminated faces, and stand on the top of a cast-iron tower.

MASTER MASONS.

In the reign of Edward I, and for some years afterwards, the master masons in England were chiefly foreigners, incorporated by royal authority. These artisans removed themselves in great numbers to any spot in the kingdom where the foundation of an abbey or other building was meditated. They are not, however, to be considered as the inventors, but rather as the executors of the plans which were prepared for them by the ecclesiastics, who were the only competent architects of the time The free-masons were blessed by the pope, and were first encouraged in England by Henry III., after which they were constantly employed in the country till the pointed style fell into disuse. Ever since then, however, the masons have continued to be considered a highly-important body.

FARRIERS.

With William the Conqueror was introduced the practice of shoeing the battle-horse with iron shoes fastened with nails.

The farriers were reckoned so valuable a class of artisans, that the king gave Simon St. Lis the town of Northampton, [illegible] of his wedding shoes for

[illegible] the farriers (*præfectus fabrorum*), and the employment was considered by his descendants to be so honourable a distinction, that they commemorated the fact by assuming the designation of their ancestor's craft as their surname.

SILK SPINNERS.

In the reign of Henry VI., the art of spinning and throwing silk had been introduced by a company of silk-women, of what country is not known. These females, in a petition to parliament, stated that Lombards and other Italians imported such quantities of threads and ribbonds, and other silk things, that they were impoverished. To protect *them* an act was passed (1455), prohibiting the importation of the articles which they fabricated.

PLASTERERS.

In the year 1485, and for a century before this date, plasterers were called dawbers, and mud-wall makers, who had for their wages, by the day, three pence, and for their knave or labourer, three-halfpence; they so continued until Henry VII brought with him from France, certain men who used plaster of Paris for the decoration of the walls of houses. They worked so well for the king, "and increased to be many; then sung to him for his favour, the king fulfilled their desire, and incorporated them by the name of *Gypsarium*," which was for "clay and mud, alias mortar-makers, for the use of loam and lyme" But for half a century, the public, who are always slow to sanction what they consider the innovations, continued to call them "dawbers"

COINING MONEY.

Henry III. issued a writ in 1247, authorising Reyner de Brusell, to bring persons from beyond seas skilled in the coinage and exchange of silver, to work at the king's charge. The method of coining in this and bygone times, was rude and inartificial One die was fixed firmly in a wooden block, the other die was held in the hand like a puncheon; the piece of silver of the proper weight was laid on the lower die, and by repeated blows of the hammer on the punching die, the required impression was brought up. No further improvement was made on this process for 300 years. Many specimens of the old "hammered money" are to be seen in the British Museum.

CLEAR STARCHERS.

One Mistress Dinghen Vanden Plasse, daughter to a worshipful knight at Teenen, in Flanders, came to London in 1564, and professed herself a starcher, in which trade she greatly excelled Ladies sent their cambric ruffs to Mrs. Dinghen to be stiffened, and rewarded her liberally They also sent their daughters and kinswomen to be taught, so great was the admiration of the materials after having been subjected to the starching process Mrs. Dinghen charged five pounds each to teach them to starch, and one pound to teach them how to seethe the starch. Before this Holland ruffs were worn, as none could properly stiffen lawn or cambric ruffs. The wife of Guillan, her coachman, was the first clear-starcher Elizabeth had The well-known Beau Brunnell, who "reigned" during the regency of George IV. was the first who introduced starch into gentlemen's neckcloths.

WOOLLEN CLOTH MANUFACTURE

To the skill and invention of John Kempe, and the hosts of ingenious Flemings of the same and auxiliary trades who followed them to England, we are indebted for having established the manufacture of fine woollen cloth on a foundation that has not once been shaken for five hundred years. But neither their skill, nor their habits of industry, nor the knowledge they had spread of a valuable manufacture, nor their misfortunes, could save them from the persecution of the native cloth makers and weavers, who were become skilful, and were growing rich, from following their examples and instructions.

These meritorious Flemings were at all times the objects of vulgar hatred and malice, and their lives in danger. In the summer of 1369, more particularly, they became the victims of popular fury; and gross outrages were committed upon them, until Edward issued a proclamation declaring them to be under his especial protection. A short time after his death, the ill will of the native workmen again broke out into open violence against the "cursede forrainers." Richard II. acted as a mediator, and an agreement in 1379 was effected between the native and foreign interests, which was confirmed by the royal authority.

The foreign workmen were now so numerous in London, that places were assigned to them in which they could deliberate on the affairs of their communities. The church-yard of St Lawrence Pultney was appropriated to the Flemings, and that of St. Mary Somerset to the Hollanders.

LIST OF TRADES IN 1415.

In the order for the pageants of the play of Corpus Christi, during the mayoralty of William Aline, A D 1415, the following crafts and callings were marshalled at York. tanners, plasterers, carde-makers, fullers, coupers, armourers, gaunters, shipwrights, fishmongers, mariners, pthomyners, bukbyders, hoxyers, spicers, pewterers, founders, tylors, chaundelers, goldsmiths, gold-beaters, mone-makers, masons, [illegible]ashals, girdelers, naylers, sawlers, sporriers, loryners, barbers, smiths, vyntners, aulnayers, plummers, pattern-makers, pouch makers, botilers, cap-makers, vestment-makers, skynners, cuttelars, bladesmiths, shethers, scalers, bukle-makers, horners, bakers, waterleders, saut-makers, milners, tiel makers, ropers, ewers, turners, heyresters, bollers, shermen, pynners, lateners, paynters, bouchers, pulterers, satelers, glaziers, carpenters, joiners, cartwrights, carvers, sawyers, wyredrawers, broggers, wool pakkers, wadmen, escriveners, lumners, questers, dubbors, tailyeurs, potters, drapers, lynwevers, wevers of wollen, mercers, hostilers

RATE OF WAGES FIXED BY THE MAGISTRATES.

The act passed by Elizabeth in 1563 was intended to empower the justices to fix the rate of wages of labourers and workmen generally, but doubts being raised on some of its clauses, its operation was confined to the wages of agricultural labourers only The measure, on the whole, was said to have been beneficial to the labourers, although the wages had not always been regulated and proportioned according to the "plenty, scarcity, and necessity of the times, as they ought to have been." By the law the justices had authority not only to fix the rate of wages of agricultural labourers, but the wages of weavers, spinsters, and of all workmen whatsoever engaged by the day, month, or year They were also empowered to fix what every person should take by the great (or piece), for mowing, reaping, and the [illegible] of corn, mowing and making of hay, ditching [illegible] or hedging, by the rod, perch, lugge, yard, pole, [illegible] *for every other kind of reasonable labour and* service, and those who either gave or received more or less than the authorised wages, were to pay a penalty of ten shillings, to be collected, if need were, by distress and sale of the offender's goods

COERCION OF WORKING

In the year 1352 Edward III granted authority by letters-patent to Henry de Brusell and John de Cicestre, to choose and take as many goldsmiths, smiths, and other workmen, as they required in the city of London, and place them at work in the Tower, at wages to be allowed by the patentees If any of the pressed mechanics should refuse to work, and be rebellious, or run away, they were to be seized and put in prison until the king should determine on their punishment.

In the year 1559 an extraordinary attempt was made by one part of society to promote by force its interest and convenience at the expense of the interest and convenience of another portion of its members. A bill was brought into parliament, and read three times, to *compel* artificers and craftsmen who might be living in the inland parts of Kent and Sussex, to dwell in towns on the sea-coast. The townsmen, no doubt, required the assistance of such mechanics, and their not having it would now be considered a proof either of their unwillingness or inability to pay liberally for it, or of the towns being less prosperous than heretofore, and having "many empty houses to let."

REMOVAL OF TRADE RESTRICTIONS.

One of the first acts of Philip and Mary was to remove some of the absurd restrictions that were now seen to cramp the freedom of trade. The act of Edward VI., by which no one was to make cloth who had not been apprenticed to it for seven years, was annulled, the act says that "some who had married clothiers' wives for twenty years were obliged to leave off the business" on that account; and forasmuch as the perfect and principal ground of cloth-making is the true *sorting of wools*, and the experience thereof consisteth of women and children, and not in apprentices, every person inhabiting where cloth-making hath been used may henceforth make all manner of broad-cloths, and put them to weaving, walking, *fulling*, *dyeing*, and shearing, so that the cloths be substantially made, and bearing lawful length, breadth and weight And this was about the first glimpse of a wise policy in the history of English manufacturing labour.

THE DRAYMAN AND THE MILKMAN.

PERHAPS in all wide London no two individuals of more opposite characteristics could possibly be found than the two whose portraits grace these pages. The drayman is big and burly, with a bloated face and an inactive set of limbs; while the milkman is thin and spare like his own delectable compound. The first seems the impersonation of dullness and heavy potations; the last the incarnation of lively good-nature and hard work. The countenance of the one seems to express a sort of brutal contentment with his lot, while that of the other shines, like a winter apple, all red and ruddy and full of hopefulness. The one is the

THE BREWER'S DRAYMAN.

dispenser of a hateful adulterated compound of spoiled water which is known indifferently as "beer," "ale," "porter," "double X," &c.,—while the other retails a liquid which is good and healthful, just in proportion to its purity,—at any rate, it cannot do harm. "Bless my heart," said a gentleman, who was walking arm in arm with Caleb Whitefoord, "what can that fellow with the milk cans mean by his continual cry, 'mi-eaux, mi-eaux,' he surely cannot mean *milk?*" "No, certainly not," returned the wit, "how can he? Mi-eaux! quite right, half water."

Any morning early—though the summer months are best for early walks in London—the milkman may be seen trudging along with his cans from house to house in the city, walking up the empty streets with his not unmelodious cry, and bringing neat servant maids to the doors, for every one of whom he has a pleasant word. The miles that some people walk in the prosecution of their various businesses in London, seems almost incredible. The postman, for instance, in the course of his daily rounds, walks from twenty to twenty-five miles; and the very dustmen who cart away the rubbish from our houses, are reckoned to pass over more than half the above distance, between eight o'clock and noon. But to return to our friend "Mi-eaux." A great many tales have been told of the strange substances with which he is said to adulterate his useful liquid; but from examinations recently made of the milk sent from various dairies, it has been found that, in most instances, water alone has been added t increase the quantity;—we all know the meaning of the comme allusion to the prolific black cow with the iron tail, whic stands in the centre of the dairy yard.

In the neighbourhood of Islington, Highgate, and the nort west suburbs of London, are situated the large establishmen from which a great part of the London supply of milk derived; though small cow-keepers are to be found scattered a over the town, and much milk is brought from distant places b railway. Some of the dairymen alluded to keep as many as eigh hundred or a thousand cows, the produce of which is sent ou in all directions in sealed cans. Sometimes the cans are under th

care of men, though occasionally stout young Welsh women are employed,—and the very pictures of rude health they seem, as they walk along the dusty road in twos and threes from the suburban dairies to the various places of sale in town. It seems that the milkman's occupation is pre-eminently a healthy one.

It [illegible] when we see a big, bloated, portly-looking fellow, with a body as round as his own barrels, in attendance on a brewer's dray, we are apt to give the credit of his good looks to the beer he drinks. There never was a greater mistake, however, than to suppose these lusty folks are all strong and of good constitution. Physiologists know full well that when the system turns nutriment into fat instead of muscle, it is a sign of weakness and not strength. The brewer's drayman, stout and powerful as he seems, is, after all, but a mass of incipient disease, which a slight wound—a scratched finger or a bruised shin—may bring down to the couch of sickness in a day, and when once down, the unwieldy body, like a huge butt of "double X," is somewhat difficult to set up again.

We recollect reading, in a magazine devoted to the temperance question, a very pertinent article, entitled "What stops the way?" Going down Fleet street one morning, the writer observed that the whole carriage road was blocked up, so that neither cab nor omnibus could proceed upon its journey; and on inquiring the cause of the delay, he discovered that a brewer's dray, standing before the door of a public house, entirely prevented all progress among the other vehicles. This fact led the writer to moralise as he walked along; and arguing the matter to himself, he came to the conclusion that the drinking practices of the world were but huge stumbling blocks in the way of human progression. If the religious, moral, and educational progress of the people seems to stand still or retrograde, he said to himself, there must be some latent cause for it; if the work of good men at home and the mission to the heathen in far-off lands produce not the good fruit calculated on, there must be some sufficient reason for the failure; if the efforts of the great-hearted men who would emancipate society from the thraldom of vice and sin, and break the chains of slavery, never to be forged again; if these efforts prove insufficient or of no avail, there must be some giant obstacle in the path. What blocks up the road to happiness and self-improvement? What impedes the onward march of civilisation and refinement? What stops the way? What, indeed, but the BREWER'S DRAY.

There is a world of meaning in this little episode; though the chances are that our friend of the whip and leather apron would find it difficult to believe that he and his trade could possibly be obstructions to the public good. But after all, the brewer's drayman may be a good, harmless, simple sort of fellow enough, for it does not follow that because the system is vile the instrument must be vicious too—any more than that we should consider the poor fellow who carries the milk-pails a horrible adulterator, because our morning's milk has sometimes (we don't say always) contained an undue proportion of water compared with the quantities of oil, sugar, and protein of which it should consist.

THE MILKMAN.

The ancients had a proverb which they were in the habit of applying to such disputable cases, the English of which is, that "The truth lies between."

By the way, it has lately been found that milk dried and solidified can be kept for any length of time; and that, when the dried mass is powdered and liquified with hot water, it is nearly as good as it was when it first came from the cow. The discovery is one of immense importance to sea-faring men; and one that may be emphatically called, "A REAL BLESSING TO MOTHERS."

A GOOD INVESTMENT.

"THAT's a smart little fellow of yours," said a gentleman named Winslow to a labouring man who was called in occasionally to do work about his warehouse. "Does he go to school?"

"Not now, sir," replied the poor man.

"Why not, Davis? He looks like a bright lad."

"He's got good parts, sir," returned the father; "but——"

"But what?" asked the gentleman, seeing that the man hesitated.

"Times are rather hard now, sir, and I have a large family. It's about as much as I can do to keep hunger and cold away. Ned reads very well, writes a tolerably fair hand, considering all things, and can figure a little. And that's about all I can do for him. The other children are coming forward, and I reckon he will have to go to a trade middling soon."

"How old is Ned?" inquired Mr. Winslow.

"He's turned of eleven."

"You won't put him to a trade before he's thirteen or fourteen?"

"Can't keep him at home idling about all that time, Mr. Winslow. It would be his ruination. It's young to go out from home, I know, to rough it and tough it among strangers"—there was a slight unsteadiness in the poor man's voice—"but it's better than doing nothing."

"Ned ought to go to school a year or two longer, Davis," said Mr. Winslow, with some interest in his manner. "And as you are not able to pay the quarter bills, I will. What say you? If I pay for Ned's schooling, can you keep him at home some two or three years longer?"

"I didn't expect *that* of you, Mr. Winslow," said the poor man, and his voice now trembled. He uncovered his head as he spoke, almost reverently. "You aint bound to pay for schooling my boy, sir."

"But you have answered my question, Davis. What say you?"

"Oh, sir, if you are really in earnest——"

"I am in earnest. Ned ought to go to school. If you can keep him home a few years longer, I will pay for his education during the time. Ned"—Mr. Winslow spoke to the boy—"what say you? Would you like to go to school again?"

"Yes, indeed, sir," quickly answered the boy, while his bright young face was lit up with a gleam of intelligence.

"Then you shall go, my fine fellow. There's the right kind of stuff in you, or I'm mistaken. We'll give you a trial at any rate."

Mr. Winslow was as good as his word. Ned was immediately entered at an excellent school. The boy, young as he was, appreciated the kind act of his benefactor, and resolved to profit by it to the fullest extent.

"I made an investment of five pounds to-day," said Mr Winslow, jestingly, to a mercantile friend, some twelve months after the occurrence just related took place, "and here's the certificate."

He held up a small slip of paper as he spoke.

"Five pounds! A large operation! In what fund?"

"A charity fund."

"Oh!" and the friend shrugged his shoulders. "Don't do much in that way myself. No great faith in the security. What dividend do you expect to receive?"

"Don't know. Rather think it will be large."

"Better take some more of the stock if you think it is so good. There is plenty in market to be bought at less than par."

Mr. Winslow smiled, and said that, in all probability, he should invest a few more small sums in the same way, and see how they would turn out. The little piece of paper, which he called a certificate of stock, was the first year's bill he had paid for Ned's schooling. For four years these bills were regularly paid, and then Ned, who had well improved the opportunities so generously afforded him, was taken, on the recommendation of Mr. Winslow, into a large importing-house. He was at that time in his sixteenth year. Before the lad could enter upon this employment, however, Mr. Winslow had to make another investment in his charity fund. Ned's father was too poor to give him an outfit of clothing such as was required in the new position to which he was to be elevated; knowing this, the generous merchant came forward again, and furnished the needful supply.

As no wages were received by Ned for the first two years, Mr. Winslow continued to buy his clothing, while his father still gave him his board. On reaching the age of eighteen, Ned's employers, who were much pleased with his industry, intelligence, and attention to business, put him on a salary of eighty pounds a year. This made him at once independent. He could pay his own boarding, and find his own clothes, and proud did he feel on the day when advanced to so desirable a position.

"How comes on your investment?" asked Mr. Winslow's mercantile friend about this time. He spoke jestingly.

"It promises very well," was the smiling reply.

"It is rising in the market, then?"

"Yes."

"Any dividends yet?"

"Oh, certainly. Large dividends."

"Ah! You surprise me. What kind of dividends?"

"More than a hundred per cent."

"Indeed! Not in money?"

"Oh, no, but in something better than money—the satisfaction that flows from an act of benevolence wisely done."

Oh, that's all." The friend spoke with ill-concealed contempt.

"Don't you call that something?" asked Mr. Winslow.

"It's too unsubstantial for me," replied the other. "I go in for returns of a more tangible character. Those you speak of won't pay."

Mr. Winslow smiled, and bade his friend good morning.

"He knows nothing," said he to himself, as he mused on the subject, "of the pleasure of doing good, and the loss is all on his side. If we have the ability to secure investments of this kind, they are about the best we can make, and all are able to put at least some money in the fund of good works, let it be ever so small an amount. Have I suffered the abridgement of a single comfort by what I have done? No. Have I gained in pleasant thoughts and feelings by the act? Largely. It has been a source of perennial enjoyment. I would not have believed that at so small a cost I could have secured so much pleasure. And how great the good that may flow from what I have done! Instead of a mere day-labourer, whose work in the world goes not beyond the handling of boxes, bales, and barrels, or the manufacture of some article in common use, Edward Davis, advanced by education, takes a position of more extended usefulness, and, by his higher ability and more intelligent action in society, will be able, if he rightly use the power in his hands, to advance the world's onward movement in a most important degree."

Thus thought Mr Winslow, and his heart grew warm within him. Time proved that he had not erred in affording the lad an opportunity for obtaining a good education. His quick mind acquired, in the position in which he was placed, accurate ideas of business, and industry and force of character made these ideas thoroughly practical. Every year his employers advanced his salary, and, on attaining his majority, it was further advanced to the sum of one hundred and fifty pounds per annum. With every increase the young man had devoted a larger and larger proportion of his income to improving the condition of his father's family, and when it was raised to the sum last mentioned he took a neat, comfortable house, much larger than the family had before lived in, and paid the whole rent himself. Moreover, through his acquaintance and influence, he was able to get a place for his father at higher employment than he had heretofore been engaged in, and at a higher rate of wages.

"Any more dividends on your charity investment?" said Mr. Winslow's friend about this time. He spoke with the old manner, and from the old feelings.

"Yes. Got a dividend to-day—the largest yet received," replied the merchant, smiling.

"Did you? Hope it does you a great deal of good."

"It is doing me a great deal of good," returned Mr. Winslow.

"No cash, I presume?"

"Something far better. Let me explain."

"Do so, if you please."

"You know the particulars of this investment?" said Mr. Winslow.

His friend shook his head, and replied—

"No. The fact is I never felt interest enough in the matter to inquire particulars."

Oh. Well, then, I must give you a little history. You know old Davis, who has been working about our stores for the last ten or fifteen years?"

"Yes."

"My investment was in the education of his son."

"Indeed!"

"His father took him from school when he was only eleven years old, because he could not afford to send him any longer, and was about putting the little fellow out to learn a trade. Something interested me in the child, who was a bright lad, and, acting from a good impulse that came over me at the moment, I proposed to his father to send him to school for three or four years, if he would board and clothe him during the time. To this he readily agreed. So I paid for Ned's schooling until he was in his sixteenth year, and then got him into Web and Waldron's warehouse, where he has been ever since."

"Webb and Waldron's!" said the friend, evincing some surprise. I know all their clerks very well, for we do a great deal of business with them Which is the son of old Mr. Davis?"

"The one they call Edward."

"Not that tall, fine-looking young man—their leading salesman?"

"The same."

"Is it possible! Why, he is worth any two clerks in the office!"

"I know he is."

"For his age, there is not a better salesman in the city."

"So I believe," said Mr. Winslow; "nor," added he, "a better man."

"I know little of his personal character; but, unless his face deceives me, it cannot but be good."

"It is good. Let me say a word about him. The moment his salary increased beyond what was absolutely required to pay his board and find such clothing as his position made it necessary for him to wear, he devoted the entire surplus to rendering his father's family more comfortable."

"Highly praiseworthy," said the friend.

"I had received already many dividends on my investment," continued Mr. Winslow; "but when that fact came to my knowledge, my dividend exceeded all the other dividends put together"

The mercantile friend was silent. If ever in his life he had envied the reward of a good deed, it was at that moment.

"To-day," went on Mr. Winslow, "I have received a still larger dividend. I was passing along Wood-street, when I met old Mr. Davis coming out of a house, the rent of which, from its appearance, was not less than forty pounds a year. 'You don't live here, of course,' said I, for I knew the old man's income to be small. 'Oh, yes, I do,' he made answer, with a smile. I turned and looked at the house again. 'How comes this?' I asked You must be getting better off in the world.' 'So I am,' was his reply.' 'Has anybody left you a little fortune?' I inquired. 'No; but you have helped me to one,' said he 'I don't understand you, Mr. Davis,' I made answer. 'Edward rents the house for us,' said the old man. 'Do you understand me now?'

"I understood him perfectly. It was then that I received the largest dividend on my investment which has yet come into my hands. If they go on increasing at this rate, I shall soon be rich."

"Rather unsubstantial kind of riches," was remarked by his friend.

"That which elevates and delights the mind can hardly be called unsubstantial," replied Mr. Winslow. "Gold will not always do this."

The friend sighed involuntarily. The remarks of Mr. Winslow caused thoughts to flit over his mind that were far from being agreeable.

A year or two more went by, and then an addition was made to the firm of Webb and Waldron. Edward Davis received the offer of an interest in the business, which he unhesitatingly accepted. From that day he was on the road to fortune. Three years afterwards, one of the partners died, when his interest was increased.

Twenty-five years from the time Mr. Winslow, acting from a benevolent purpose, proposed to send young Davis to school, have passed.

One day, about this period, Mr. Winslow, who had met with a number of reverses in business, was sitting in his countingroom with a troubled look on his face, when the mercantile friend before mentioned came in. His countenance was pale and disturbed.

"We are ruined! ruined!" said he, with much agitation.

Mr. Winslow started to his feet.

"Speak!" he exclaimed. "What new disaster is about to sweep over me?"

"The house of Toledo and Co has suspended payment."

Mr. Winslow struck his hands together, and sunk down into the chair from which he had arisen.

"Then it is all over!" he murmured; "all over!"

"It is all over with me," said the other. A longer struggle would be fruitless. But for this I might have weathered the storm. So closes a business life of nearly forty years in commercial dishonour and personal ruin!"

"Are you certain that they have failed?" asked Mr. Winslow, with something like hope in his tone of voice.

"It is too true," was answered. "The Celeste arrived this morning, and her letter-bag was delivered at the post-office half-an-hour ago. Have you received nothing by her?"

"I was not aware of her arrival But I will send immediately for my letters"

Too true was the information communicated by the friend: the large commission-house of Toledo and Co had failed, and protested drafts had been returned to a very heavy amount. Mr. Winslow was among the sufferers, and to an extent that was almost equivalent to ruin.

For nearly five years everything had seemed to go against Mr. Winslow. At the beginning of that period a son, whom he had set up in business, failed, involving him in a heavy loss. Then one disaster after another followed, until he found himself in imminent danger of failure. From this time he turned his mind to the consideration of his affairs with more earnestness than ever, and made every transaction with a degree of prudence and foresight that ied to guarantee success in whatever he attempted. A deficient supply of flour caused him to venture a large shipment. The sale was at a remunerative profit, but the failure of his consignees, before the payment of his drafts for the proceeds, entirely prostrated him. So hopeless did the merchant consider his case, that he did not even make an effort to get temporary aid in his extremity.

When the friend of Mr. Winslow came with the information that the house of Toledo and Co. had failed, the latter was searching about in his mind for the means of obtaining money to meet his acceptance, which fell due on that day. He had partly fixed upon the resources from which this money was to come, when the news of his ill-fortune arrived

Yes; it was ruin. Mr Winslow saw that in a moment, and his hands fell powerless by his side. He made no further effort to raise the money, but, after his mind had recovered a little from its first shock, he left his warehouse and retired to his home, to seek in its quiet the calmness and fortitude of which he stood so greatly in need In this home were his wife and two daughters, who all their lives had enjoyed the many external comforts and elegances that wealth can procure The heart of the father ached as his eyes rested upon his children, and he thought of the sad reverses that awaited them

On entering his dwelling, Mr. Winslow sought the partner of his life, and communicated to her, without reserve, the painful intelligence of his approaching failure.

"Is it indeed so hopeless?" she asked, tears filling her eyes.

"I am utterly prostrate!" was the reply, in a voice that was full of anguish And, in the bitterness of the moment, the unfortunate merchant wrung his hands

To Mrs Winslow the shock, so unexpected, was very severe; and it was some time before her mind, after her husband's announcement, acquired any degree of calmness.

About half an hour after Mr Winslow's return home, and while both his own heart and that of his wife were quivering with pain, a servant came and said that a gentleman had called and wished to see him

"Who is it?" asked the merchant.

"I did not understand his name," replied the servant.

Mr. Winslow forced as much external composure as was possible, and then descended to the parlour.

'Mr. Davis," he said, on entering.

'Mr. Winslow," returned the visitor, taking the merchant's hand, and grasping it warmly.

As the two men sat down together, the one addressed as Mr. Davis said—

"I was sorry to learn, a little while ago, that you will lose by this failure."

"Heavily. It has ruined me!" replied Mr. Winslow.

"Not so bad as that I hope!" said Mr. Davis.

"Yes. It has removed the last prop that I leaned on, Mr. Davis—the very last one—and now the worst must come to the worst. It is impossible for me to take up the five thousand of returned drafts."

"Five thousand, do you say, is the amount?"

"Yes."

Mr. Davis smiled encouragingly.

"If that is all," said he, "there is no difficulty in the way. I can easily get you the money."

Mr. Winslow started, and a warm flush went over his face.

"Why didn't you come to me," asked Mr. Davis, "the moment you found yourself in such a difficulty? Surely," and his voice slightly trembled, "surely, you did not think it possible for me to forget the past? Do not I owe you everything? and would I not be one of the basest of men if I forgot my obligation? If your need were twice five thousand, and it required the division of my last sovereign with you, not a hair of your head should be injured. I did not know that it was possible for you to get into an extremity like this until I heard it whispered a little while ago."

So unexpected a turn in his affairs completely unmanned Mr. Winslow. He covered his face, and wept for some time with the uncontrollable passion of a child.

"Ah! sir," he said at length, in a broken voice, "I did not expect this."

"You had a right to expect it," replied the young man. "Were I to do less than sustain you in any extremity not too great for my ability, I would be unworthy the name of man. And now, Mr. Winslow, let your heart be at rest. You need not fall under this blow. Your drafts will probably come back to you to-morrow."

"Yes; to-morrow at the latest."

"Very well; I will see that you are provided with the means to take them up. It is nearly two o'clock now," he added; "so I will bid you good day. In fifteen minutes you will find a check at your warehouse."

And with this Davis retired.

All this, which passed in a brief space of time, seemed like a dream to Mr. Winslow. But it was a reality, and he comprehended it more fully when on reaching his warehouse he found there the promised check.

On the next day the protested drafts came in; but, thanks to the grateful kindness of Mr. Davis, now a merchant with the command of large money facilities, he was able to take them up. The friend before introduced was less fortunate. There was no one to step forward and save him from ruin, and he sunk under the sudden pressure that came upon him.

A few days after this failure he met Mr. Winslow.

"How is this?" said he; "how did you weather the storm. I thought your condition as hopeless as mine."

"So did I," answered Mr. Winslow; "but I had forgotten a small investment made years ago. I have spoken of it to you before."

The other looked slightly puzzled.

"Have you forgotten that investment in the charity fund, which you thought money thrown away?"

"Oh!" Light broke in upon his mind. "You educated Davis. I remember now."

"And Davis, hearing of my extremity, stepped forward and saved me. That was the best investment I ever made."

The friend dropped his eyes to the pavement, stood for a moment or two without speaking, sighed, and then moved on. How many opportunities for making similar investments had he not neglected!

A NIGHT WITH OSSIAN.

(FROM THE MEMOIRS OF MARGARET FULLER OSSOLI.)

At Inveranaid we took a boat to go down Loch Lomond, to the little inn of Rowardennan, from which the ascent is made of Ben Lomond. We found a day of ten thousand for our purpose; but, unhappily, a large party had come with the sun, and engaged all the horses, so that, if we went, it must be on foot. This was something of an enterprise for me, as the ascent is four miles, and towards the summit quite fatiguing. However, in the pride of newly-gained health and strength, I was ready, and set forth with Mr. S. alone. We took no guide, and the people of the house did not advise it as they ought.

On reaching the peak the sight was one of beauty and grandeur such as imagination never painted. You see around you no plain ground, but, on every side, constellations, or groups, of hills, exquisitely dressed in the soft purple of the heather, amid which gleams the lakes, like eyes that tell the secrets of the earth, and drink in those of the heavens. Peak beyond peak caught from the shifting light all the colours of the prism, and on the furthest, angel companies seemed hovering in white robes.

About four o'clock we began our descent. Near the summit the traces of the path are not distinct, and I said to Mr. S. after a while, that we had lost it. He said he thought that was of no consequence; we could find our way down. I said I thought it was, as the ground was full of springs that were bridged over in the pathway. He accordingly went to look for it, and I stood still, because I was so tired I did not want to waste any labour.

Soon he called to me that he had found it, and I followed in the direction where he seemed to be. But I mistook, overshot it, and saw him no more. In about ten minutes I became alarmed, and called him many times. It seems he on his side shouted also, but the brow of some hill was between us, and we neither saw nor heard one another. I then thought I would make the best of my way down, and I should find him when I arrived; but in doing so, I found the justice of my apprehension about the springs as soon as I got to the foot of the hills, for I would sink up to my knees in bog, and must go up the hills again, seeking better crossing places. Thus I lost much time. Nevertheless, in the twilight, I saw, at last, the lake, and the inn of Rowardennan on its shores.

Between me and it lay, direct, a high heathery hill, which I afterwards found is called "The Tongue," because hemmed in on three sides by a watercourse. It looked as if, could I only get to the bottom of that, I should be on comparatively level ground. I then attempted to descend in the watercourse, but finding that impracticable, climbed up the hill again, and let myself down by the heather, for it was very steep, and full of deep holes. With great fatigue I got to the bottom, but when I was about to cross the watercourse there, I felt afraid, it looked so deep in the dim twilight. I got down as far as I could by the root of a tree, and threw down a stone. It sounded very hollow, and I was afraid to jump. The shepherds told me afterwards, if I had, I should probably have killed myself, it was so deep, and the bed of the torrent full of sharp stones.

I then tried to ascend the hill again, for there was no other way to get off it; but soon sank down utterly exhausted. When able to get up again, and look about me, it was completely dark. I saw, far below me, a light, that looked about as big as a pin's head, that I knew to be from the inn at Rowardennan, but heard no sound, except the rush of the waterfall and the sighing of the night wind.

For the first few minutes after I perceived I had got to my night's lodging, such as it was, the circumstance looked appalling. I was very lightly clad, my feet and dress were very wet, I had only a little shawl to throw round me, and the cold autumn wind had already come, and the night mist was to fall on me, all fevered and exhausted as I was. I thought I should not live through the night, or, if I did, I must be an invalid henceforward. I could not even keep myself warm by walking, for, now it was dark, it would be too dangerous to stir. My only chance, however, lay in motion, and my only help in myself; and so convinced was I of this, that I did keep in motion the whole of that long night, imprisoned as I was on such a little perch of that great mountain.

For about two hours I saw the stars, and very cheery and companionable they looked; but then the mist fell, and I saw nothing more, except such apparitions as visited Ossian, on the hill side when he went out by night, and struck the bosky shield, and called to him the spirit of the heroes, and the white-armed maids, with their blue eyes of grief. To me, too, came those visionary shapes. Floating slowly and gracefully, their white robes would unfurl from the great body of mist in which they had been engaged, and come upon me with a kiss pre-

vasively cold as that of death. Then the moon rose. I could not see her, but her silver light filled the mist. Then I knew it was two o'clock, and that, having weathered out so much of the night, I might the rest; and the hours hardly seemed long to me more.

It may give an idea of the extent of the mountain, that though I called, every now and then, with all my force, in case by chance some aid might be near, and, though no less than twenty men, with their dogs, were looking for me, I never heard a sound, except the rush of the waterfall and the sighing of the night wind, and once or twice the startling of the grouse in the heather. It was sublime indeed, a never-to-be forgotten presentation of stern, serene, realities. At last came the signs of day, the gradual clearing and breaking up. Some faint sounds from I know not what: the little flies, too, arose from their beds amid the purple heather, and bit me. Truly, they were very welcome to do so. But what was my disappointment to find the mist so thick, that I could see neither lake nor inn, nor anything to guide me. I had to go by guess, and, as it happened, my Yankee method served me well. I ascended the hill, crossed the torrent, in the waterfall, first drinking some of the water, which was as good at that time as ambrosia. I crossed in that place, because the waterfall made steps, as it were, to the next hill. To be sure, they were covered with water, but I was already entirely wet with the mist, so that it did not matter. I kept on scrambling, as it happened, in the right direction, till about seven some of the shepherds found me. The moment they came, all my feverish strength departed, and they carried me home, where my arrival relieved my friends of distress far greater than I had undergone; for I had had my grand solitude, my Ossianic visions, and the pleasure of sustaining myself; while they had had only doubt, amounting to anguish, and a fruitless search throughout the night.

Entirely contrary to my forebodings, I only suffered for this a few days, and was able to take a parting look at my prison, as I went down the lake, with feelings of complacency. It was a majestic-looking hill, that Tongue, with the deep ravines on either side, and the richest robe of heather I have anywhere seen.

THE DREAM OF AN EASTERN MERCHANT.

"Some people are rich who deserve to be poor, their only aim in life being the enjoyment of selfish indulgences—some who have power exercise it for evil instead of good,—while others, who though misers, oppressors of the poor, and extortioners, are yet happy and prosperous. Oh! would that I could open their coffers before another coin is added, that I might distribute their ill-gotten wealth amongst the unwary whom they deceived, the widows whom they oppressed, the orphans whom they defrauded. Naked would I drive them from their houses, to beg their bread, or to bray amongst the nettles."* Thus murmuring against the dispensations of Providence, a young Persian merchant lay on his couch; for it was the hour when the inhabitants of the east retire to their secret chambers.† At length sleep stole over his senses, and he dreamed. What his vision was is given in his own words:—"I fancied myself," said he, "transported into a vast but highly-cultivated solitude, where the colossal trees were gracefully united by festoons of parasites and climbers, bearing flowers of the most brilliant and beautifully-blended colours. Wherever I gazed upwards, there was endless variety and loveliness; while beneath, there was an everlasting vegetation covering the ground and concealing, by the luxuriance of living plants, the decay and death of those which had given them place. This beautiful solitude was enlivened by the presence of hundreds of the feathered tribe, and as I watched them flying, soaring, hovering, or fluttering, according to their different habits and inclinations, I felt my heart filled with a tranquil joy, and I breathed forth a prayer of gratitude to the Great Being that I was no longer near the habitations of man—obliged to witness evils which I had not the power to remove, and to suffer from follies which I was unable to correct.

"The sun had risen over the horizon; his rays gilded the verdure over my head, and gave transparency to the foliage; the birds at once burst forth into song, and amazed me by the diversity of their accents, their forms, their plumage, and their flight. While I yet looked and listened, methought I was endowed with the power of understanding their language.

"The eagle was perched on the topmost branch of a magnificent palm, and was uttering words of reproach and disdain against all the smaller birds, while they, though they feared to reply to him, reviled each other. The thrush proclaimed himself the 'herald of spring,' and uttering notes of rich melody to convince his auditory of his excellence, called on a little hedge sparrow to say 'why he, who had but a few notes, and yet nothing beautiful in his appearance, should presume to cumber the earth with his presence?'

"The little bird, though in general remarkably gentle in its manners, replied with bitterness. 'My voice' said he, 'is by no means contemptible, and, beside the pleasure I afford by my song, I am useful in assisting to free the earth from those insects which would overrun and destroy it in summer, by feeding on the larvæ in winter, and seeking for them in the crevices of the bark of trees where man could not discover them.'

Having so said, he flew off, without waiting to hear the thrush boast that he also was useful to man, inasmuch as he lived during the summer on those large troublesome insects which eat up the choicest fruit.

'For instance,' said he, 'I may be often seen busily employed in destroying noxious snails and worms, or beating against the stones the hard shell of the snail and making a meal of the occupant; *my* usefulness indeed is immense.' The sparrow did not hear the boast, he had flown off to a branch on which a pretty robin had just alighted, and was calling to his mate in wild and plaintive notes. The irritated little sparrow turned on him harshly and bid him 'be silent or begone,' but the sprightly and elegant little creature continued his carol as if unconscious of the unkind words of his neighbour.

"Amazed at the want of harmony amongst the birds, and the consequent absence of all individual happiness, I thought I saw a very extraordinary figure descend from the clouds, and alight on a plane tree,* which rose in majestic beauty above all the cedars of the forest. It was that of a young man, whose body had the appearance of newly-driven snow, over which rose leaves had been scattered. He had large blue wings, edged with gold, his hair was black as ebony; his eyes were dark and piercing, and his whole appearance majestic in the extreme. He looked around for a moment, and then called to him all the birds. They perched around him on the branches of the cedar; and, having commanded silence, he spoke. Me thought his language was a strange dialect, and yet I understood it as well as his feathered auditory.

"'What wranglings do I hear?' he said. 'What revilings are those uttered by brother against brother? Know you not that in my eyes you are all alike mean, becoming estimable only in proportion as you fulfil your duties faithfully and cheerfully? Go to! Let each one of you learn to esteem his brother better than himself, and to consider in his species

* In many countries of the east these weeds grow to an enormous size. We read of them in the Bible in the 30th chapter of Job, v. 5, 7, where the patriarch describes the former humble conditions of those who were forward to insult him in his time of trial. "They were driven," he says, "forth from among men—under the nettles they were gathered together." One species of this weed is called "Urtiga gigas" or "gigantic nettle:" it is in fact a tree having a trunk of from eighteen to twenty-two feet in circumference, and heart-shaped leaves, measuring six inches across, whose sting is as painful as that of a wasp. There is another variety of a smaller size, whose sting is still more severe, it is called the "Devil's leaf," and the Asiatics extract a powerful poison from it.

† The habit of early rising in the east, and the heat of the weather during the afternoons, render a short repose between breakfast and dinner absolutely necessary. This sleep is called a "siesta," and we read in the Bible that Ishbosheth, the son of Saul, was slain by the sons of Rimmon when he "lay on a bed at noon."

* The name given to this tree—"the plane"—signifies *ample*, or *broad*. The ancient Greeks valued it so highly, that they poured wine, instead of water, on its roots. Two great poets—Virgil and Homer—wrote in its praise, and our young friends are no doubt familiar with the description given of it in the Bible:—"Thus was he fair in his *greatness*, in the length of his branches, for his root was by great waters. The cedars in the garden of God could not hide him. The fir-trees were not like his boughs, and the chesnut-trees were not like his branches, nor any tree in the garden of God was like unto him in his beauty."

differences and not defects. Have I not bestowed a variety of qualities, yet whom have I made ruler over the rest? The eagle, it is true, because of his strength, assumes lordship, and his loud, inharmonious cry proclaims his pride; yet before me is one little fringilla, which points the weary traveller to the well-spring in the desert, of more worth than all the eagles on the earth.'

"He ceased, and I thought he looked earnestly at me for a moment. He then unfolded his magnificent wings, and flew towards the clouds. I awoke, and found myself stretched on my couch, my heart filled with the heavenly vision. I arose, and, falling on my knees, besought of the Giver of all Good to engrave on my heart the lesson I had learned in my sleep—to teach me evermore to seek to do all the good in my power—to discover the virtues and not the vices of my neighbours, and the good instead of the evil arising from their several positions. I prayed also to be given such wisdom as would enable me, where I saw abuses, to correct them prudently, and rather by precept and example than by force and coercion—inasmuch as the former would strengthen the bonds of universal brotherhood, while the latter would only serve to tear them asunder."

Thus ends the dream of the Eastern merchant.

A MODEL CHILD'S SCHOOL.

The following sketch from the "Defence of Ignorance," a clever satirical work, by the author of "How to make Home Unhealthy," may serve as a hint to those who think the "forcing" plan the best to adopt in the education of youth:—

"The teacher sits where children sit, or walks among them. Study begins, perhaps the morning and the fresh attention are devoted to those studies which, though not least needful, are the least inviting, and more pleasant subjects come as the day flags. Conversation, open utterance, is not forbidden How can a teacher pretend to form a child's mind when he forbids it to be spoken? In a silence broken only by words learned out of a book, how is it possible that the chief object of education can be obtained at all? So says John Smith, and the work goes on The children fidget, shift their places, and are suffered freely so to do: it is the instinct of their childhood. They openly make boats and chip at wood, and play with paper, when their hands are not employed. Allegiance to childhood is not insubordination. So they work cheerfully, and know themselves at school to be free agents doing a duty. At the end of every hour's work, they scamper out to scream and play at leapfrog Recalled, they scamper back as rapidly as if there were a cane for the last comer.

"Morning has been spent in languages, arithmetic, or algebra, and exercises which demand labour of which the pleasant fruit is not immediately to be gathered It has imposed upon the children mental toil. The afternoon is full of mental pleasure. The history of man's deeds and works and the wonders of nature engage childish hearts more powerfully. Not as detailed in skeleton books. A dinner of dry bones makes no man fat. The teacher predetermines that he will occupy perhaps three years in a full narration of the story of the world. He begins at the first dawn of history, studies for himself with patient diligence upon each topic the most correct and elaborate records (for which purpose he requires aid of a town library), and pours all out in one continued stream from day to day, enlivened by a childlike style. The children comment as the story runs; the teacher finds a hint sufficient at a time by way of moral, he is rather willing to be taught by the experience of what fresh hearts applaud or censure in the old worn stage of life. Natural history and science, all the -ologies, and -tics, and -nomics, succeed each other, also, as a three years' story of the wisdom which begot the world. Foreign countries, not dismissed in a few dozen of the driest existing sentences, are visited in company with pleasant travellers. Clever, good-humoured books of travel, carry the imaginations of the children round the world. In all these latter studies they take lively interest, remembering, to a remarkable extent, what they hear. On every point they have spoken freely in the presence of a teacher, not desirous to create dull copies of himself, but to permit each budding mind to throw out shoots and spread its roots according to its own inherent vigour. He manures and waters, watches to remove all parasitic growths, but the true, healthy mind, expands unchecked under his care."

LINES SUGGESTED BY THE BAS-RELIEFS BY THORWALSDEN,

"NIGHT" AND "MORNING,"

In the Sculpture Gallery of His Grace the Duke of Devonshire, at Chatsworth. By Miss H. M. Rathbone.

MORNING.

Wake! antler'd stag and dappled fawn—
Greet the fair young blushing dawn,
Before whose flaunk and radiant mien
Ill omened owls give place unseen
The feathered choir, rejoicing, sing
Sweet matins to their Heavenly King,
And ebon-tressed returning night
Rolls back the misty vapours white
That curtain every heath-clad height,
White roses, and each scented flower
That deck thessalyan maiden's bower,
In new-born beauty, haste to bless
Day's presence by their loveliness.
Sing, milkmaids, sing your carols blythe,
And, labourers, ply your busy scythe,
The huntsman seeks some far-off glade,
The hen her snow-white gift hath laid;
Gone forth already the toiling bee,
Whilst sailors brave the surging sea,
And wild goats cross the thymy lea
Wake, merry children, wake and play,
As God designed, the live-long day,
And, with grateful hearts, united raise
Choral anthems of prayer and praise!
New hopes, new strength, new vital powers,
Are found in morn's first dewy hours
Then, drowsy mortals, wake, I say—
For here I may not long delay;
But swiftly speed my upward flight
To other realms on wings of light!

NIGHT

Sleep little children, calm and blest,
Cradled on your mother's breast,
Whose brooding love safe watch shall keep
Over your sweet untroubled sleep
Thou southern wind breathe soft and low,
Ye rushing waters gently flow,
Stars, let your silvery light illume
The sick man's fever-haunted room,
And then in blissful slumbers blest
His weary frame at last shall rest;
While graceful birch and dusky pine
Rich odours shed at day's decline,
Embalming some secluded walk
Where whispering lovers smile and talk.
Fair moon, who voyagest not alone,
Upheld by power above thine own,
Of holy resignation, thou
Meet emblem art with thy calm brow,
Now let thy soothing influence bring
Tranquil sleep on balmy wing
To all who daily trials know,
The worn, long-suffering, weak, and low
And blissful self-oblivion shed
Round every lonely mourner's bed
And then shall old bewrinkled care
Retire at hour of evening prayer,
When dew-like peace on all descends,
And high and low alike befriends,
While bats perform their ghostly task
And fire-flies hold their evening masque,
And happy hearts, who dream no sorrow
Can e'er disturb *their* bright to-morrow,
Smile in their sleep while visions gay
Around their youthful couches play,
Then weary mortals safe repose,
Forgetful of your deepest woes,
Until another radient dawn
Shall slowly pass the dasied lawn,
And ere the advent of the day
Shall softly beacon me away.

CURIOUS FACTS IN NATURAL HISTORY.

THE SILKWORM.—It has often been remarked that those creatures most serviceable to man are easily managed; and this is fully applicable to the silkworm Pullen observes there is scarcely anything amongst the various wonders which the animal creation affords more admirable than the variety of changes the silkworm undergoes. All the caterpillar kind do undergo indeed changes in like manner, but the covering they put on is poor and mean when compared to that golden tissue in which the silkworm wraps itself; they indeed come forth in a variety of colours, their wings bedropped with gold and scarlet, yet are they but the beings of a summer's day, both their life and beauty quickly vanish, and they leave no remembrance behind them But the silkworm leaves behind such beautiful, such beneficial monuments as at once record both the wisdom of its Creator and his bounty to man. The rearing of the silkworm has been hitherto too much neglected. The Exhibition of all Nations has proved that silk can be successfully cultivated in England, for we find in the Juries' list of awards British-grown silk *honourably mentioned* This is no mean honour considering it to be in competition with countries who have made it their study for centuries Why may not, with proper care, the same result be expected; for if one thousand silkworms can be reared, consuming the same quantity of food and producing the same weight of silk, why cannot millions be reared? Five millions sterling are annually paid for this costly material, part of which might be profitably employed at home, and afford immense employment to the humblest classes of society. The prejudice that the white mulberry tree could not be successfully cultivated in England is now proved to be erroneous, for it grows most luxuriantly in many parts of England It is the same kind that is cultivated by nations where silk is an article of commerce, possessing many advantages over the black mulberry, and producing much finer silk, and also coming much earlier into leaf The mulberry leaf must be considered the time worked by the silkworm, and under proper management a plentiful harvest may be expected All that is required is to find willing labourers. The same obstacles and prejudices had to be overcome in France, for we find that Henry IV bestowed much attention on the introduction of the silkworm in his dominions Royal Nurseries were formed, and to all who chose to apply, young mulberry trees were freely given, and in the succeeding reign the great Colbert in his anxiety to increase the production of silk, not only offered to give the tree, but also to defray the expense of transport and planting But this generous offer defeated its object, for it is in the nature of man to value least that which is [illegible]red, and the boon thus [illegible] wilfully neglected The Government soon [illegible], and had recourse to another plan; and three years after planting the cultivator received a premium for every tree found to be in a flourishing condition The following is stated to have been the result obtained by Mr Nourrigat, a cultivator of silkworms at Lunel, in the department of Herault, in France, during the year From 24 oz of eggs he obtained silkworms sufficient to produce 32 cwts. of cocoons, the worms requiring 321 cwts of mulberry leaves, or 100 leaves for every 5 cocoons, the cocoons were sold for £360 10s, the expenses were £108 5s, and the net profit £198.

HATCHING TURTLES.—The Paris journals announce that M. Vallée, one of the officials of the Jardin des Plantes, has succeeded in hatching a turtle by artificial means. On the 14th of July last he found some turtles' eggs on the sand in the enclosure reserved for the turtles, and placed three of them under his apparatus in the reptile department On the 14th of October he examined the eggs, and found a turtle, about as big as a walnut, in full life He hopes to be able to rear it. This is the first case on record of one of these creatures having been produced artificially

EXPERIENCE OF ANIMALS.—Animals are prompt at using their experience in reference to things from which they have suffered pain or annoyance Grant mentions an orang-outang which, having had when ill, some medicine administered to it in an egg, could never be induced to touch one afterwards, notwithstanding its previous fondness for them. A tame fox has been cured from stealing eggs and poultry, by giving them to him scalding hot from the saucepan. Le Vaillant's monkey was extremely fond of brandy, but would never be prevailed on to touch it again after a lighted match had been applied to some it was drinking Two carriage horses which made a point of stopping at the foot of every hill, and refused to proceed in spite of every punishment, were considered beyond cure, but it was suggested at last that several horses should be attached to the back of the carriage, and, being put into a trot, be made to pull the refractory horses backwards The result was perfectly successful, for thenceforth they faced every hill at full speed, and were not to be restrained till they reached the summit. A dog which had been beaten while some musk was held to his nose, always fled away whenever it accidentally smelled the drug, and was so susceptible of it that it was used in some psychological experiments to discover whether any portion of musk had been received by the body through the *organs of digestion*. Another dog, which had been accidentally burnt with a lucifer match, became angry at the sight of one, and furious if the act of lighting it was feigned There are, besides, so many instances recorded of even higher degrees of intelligence, that it is impossible to deny that animals have a knowledge of cause and effect Strend, of Prague, had a cat on which he wished to make some experiments with an air-pump; but as soon as the creature felt the exhaustion of the air, thus stopped the action.

THE INTELLIGENCE OF ANIMALS is the most remarkable where experience seems to lead to the formation of a future plan, and to suit itself to circumstances, as in the case of the cow, which having strayed into a carelessly open granary, continued its visits by contriving to draw the bolt with its horn, till it was found necessary to change the fastening. Such newly-excited actions of the mind amount to invention. The arctic foxes undermine other walls the poles on which flesh is hung to keep it out of their reach Gleditsch saw a burying-sylph (*necrophagus humator*) engaged in burying the body of a frog through which a stick had been thrust and finding the stick to interfere with the process, set to work and loosened the stick also A large garden spider which was constructing its web between two fruit trees, having failed in repeated efforts to attach one of the main threads as it wished, made it at last fast to a small stone, which it raised so high from the ground, that ordinary sized people could pass under it without touching Halliday mentions a mason bee, which had built its nest on a wall close to a window generally closed with a shutter, but which, when thrown back, lay so close to the wall that the nest was completely shut in to prevent this occurrence, it formed a little lump of clay, which hindered the shutter from fitting tight to the wall, and which it renewed as often as it was removed. Jesse recounts the circumstance of some rats destroying the bladder fastened over the nose of an oil bottle, and making free with the oil by dipping their tails in it and licking it off Dr Pelham saw some rats engaged in the same manner round the bung hole of a cask of wine. The same principle of adapting a means to arrive at an end was carried a degree further, because of a foreign agency being employed, by the dog which threw stones into a well, and the fox which dropped them into the neck of a pitcher, in order to get at the water Thus, also, with the monkey which Degrand, [illegible] the proof, by leaving on the table an open bottle of aniseed brandy, from which the monkey extracted with its fingers and tongue as much as it could manage to reach, and then poured sand into the bottle till the liquor ran over. Cuvier relates the anecdote of an orang-outang in the menagerie at Paris, which was in the habit of opening the door leading to a dining-room, the lock of which was out of its reach, by [illegible] from a rope fastened to the ceiling, to stop which a second was [illegible] by means of several knots, but the animal seeing the reason, and at the same time perceiving that by hanging beneath them, he drew them tighter by his weight, he climbed above them and loosened them with ease. It also unlocked a door by trying every key in the bunch till it found the right one, and if the [illegible] too high, [illegible] as soon, and mounted on it. Lucie [illegible] run through a gallery and bolt the door after it, and then conceal itself in a closet from which it first took the key. Cuvier, again, describes a monkey that drew out the claws of a cat which had scratched it Burdach had a cat which, when it wished to leave his room, sprung on a table standing near the door, and, pressing on the handle, managed to open it Animals often shape their conduct according to the experience they have learned from the acts of other animals Le Vaillant's monkey, when tired, used to jump on the backs of the dogs for a ride, but one of them objecting to this mode of horsmanship, stood still as soon as the monkey had taken his seat, knowing that from the fear of being left behind and of losing the caravan, it would immediately run off to overtake it, when the dog itself followed behind to prevent any fresh attempt

AN INTELLIGENT DONKEY.—We learn from the *Durham Chronicle* that at Croxdale North Farm, in the occupation of Mr. Joseph Nicholson, flourishes one of the most sensible and utilitarian of donkeys of which we ever remember to have read since the days of Balaam. So soon as the shades of evening set in, he begins to collect his companions, a dozen or so of calves, and proceeds to drive them home. When they have arrived in the calf-yard, he allows them to drink at the well, after which he takes a drink himself, and then marches on with his charge before him, and if any gluttonous calf stops short to eat grass, Sir John's virtuous indignation is excited, and he runs open-mouthed at him, or any straggler, until he contrives at last to drive them into the foldyard in safety—a duty which he holds to be "stuff o' the [illegible]."

MISCELLANEA.

SOUTH SEA PLAYING-CARDS.—It is pretty generally known that, during the South Sea mania a pack of playing-cards was published in illustration of the general folly. Each card contained a caricature of one of the numerous bubble companies, with a pertinent verse underneath. These cards are now extremely rare.

NINE OF CLUBS—LIVERPOOL FRESH WATER.

"This town to our western islands deal,
And serves 'em with malt liquors and with meal,
Both excellently good, then how in vain
Can people brew fine drink, yet want fresh water?"

"Peter, lad, you seemed very sarcy like when uncle Josh said he meant to ge' yer that bit o' grass land over again his orchard." "Oh, feyther, I couldn't help it," said young Highlows, "but that *comes* o' you sendin' me to school There's just forty pole in that patch o' pasture, and *forty pole*, you knows, always makes *one rood (rude)*."

A QUICK WAY OF DOING IMPORTANT BUSINESS.—A venerable couple were married at Dean Church on the 18th instant, attended only by a bridesman, the united ages of the three amounting to 193 years. On the old lady being asked how long they had courted, she sharply replied, "There has been no courtship between us, but *eigh now*, from the beginning to the end. This is almost as short a courtship as when the young quaker said to his sweetheart, "It is agreed between thy father and my father that we shall be married, and if thou wilt have me, I will have thee."

HOW TO CREATE A TEMPEST.—The *New York Reville* gives the following receipt (worthy of Macbeth's three female *friends*) for raising a tempest:—"Before the tea-things are put away, tie a stout cord across the dining-room, about nine inches from the ground, strew orange-peel on the hall-floor, place a tub of water on the first-landing, harness a dog to a coal-scuttle, shut the cat up in the piano, ring the bell for the servants, and then wait for the result." One thing appears wanting to complete the diabolical mixture—viz., to blow out the candle!

SAM WELLER IN A NEW SCENE OF ACTION.—By the *Times* of the 19th ult, we perceive that "Mr Weller, a democrat, was elected, on the 30th of January last, as a senator for California, in place of Colonel Fremont." We had been wondering for some time past what had become of Mr. Pickwick's immortal body-guard, and our readers may fancy our surprise when we found that not only had Sam gone over to California, but, with the usual fortune that attends such original geniuses, had actually been returned by the constituency of the "diggins" as a member of United States legislature! We should not much wonder if Sam, having turned "democrat," was named for the presidency!!

THE CROCUS.—The crocus is interesting both for its medical uses and historic associations. Hippocrates, the father of physic, enumerates the krokos (crocus saturis or meadow saffron) in his list of narcotic remedies, and highly praises it as a medicine for complaints of the eyes, and prescribes its use outwardly in different ointments. The plant has lost none of its importance since the time of Hippocrates. Bulbous roots of all kinds were much esteemed by the epicures of ancient Rome, and the vernal crocus was dished up in various ways as a delicacy for the stomach of antiquity.

ANSWERS TO CORRESPONDENTS.

G. H. should beware of tampering with his eyes. He had better take the advice of some eminent oculist before it be too late.

A GARDENER (Bishop Auckland).—The office of the Botanical Society is in Bedford-street, Covent-garden. Secretary, Mr. G. E. Dennes.

ENQUIRER.—You are mistaken. "*An accessory*" is not a principal offender, but one who is guilty of an offence by participation, such as commanding an act to be done, &c One who assists by advice or incitement, is called an *abettor*. If he assists by act and deed, he is an *accomplice*. "An accessory *before* the fact," is one who, being absent, procures or requires another to commit crime. "An accessory *after* the fact," is an who receives and nourishes a person or persons, knowing them to have committed a crime.

"A CONSTANT READER."—(We wish our correspondents would select some other signature You may obtain oil-colours in cakes at Reeves and Co.'s, Cheapside. Their application is simple and easy.

DANDIE DINMONT.—Your penmanship is sufficiently "good for a counting-house," but we are not aware that "white hands and teeth" are in dispensable, unless indeed you wish to be "dandy."

CHARNICUS.—We do not know what you mean by "full definition of old coin"

J. V. I.—The "Glimpses of the People of all Nations" were resumed in N

JACQUES.—The "History of form part of "John Cassell's Library," though it will probably form part of some other of his publications. The circulation of the other works about which you kindly inquire is large and increasing.

J. P. BARRAS.—The *first* number of "The Popular Educator" contains the commencement of lessons on some of the subjects you name They will all appear in that work in due course.

R. V.—The Inspector of Prisons in the United States reports the following ratio of crime to population:—"New York, 1 in 1,608, Massachusetts, 1 in 2,232, Connecticut, 1 in 1,700, Maine 1 in 5,374, New Hampshire, 1 in 4,376, Virginia, 1 in 6,850, Kentucky, 1 in 7,238; Maryland 1 in 1,336; Pennsylvania, 1 in 4,022; New Jersey, 1 in 2,010.

REDOMAI PERI TOLTON.—We see no impropriety in your taking the accustomed oaths in a court of justice, provided that you abide by the direction given—to "speak the truth—the whole truth—and nothing but the truth." The lawfulness of [illegible] question on

which you refer were fictitious—as Sir Rog[illegible]ley, Captain Sentry, Will Honeycomb, and Andrew Freeport.

[illegible] long grumbling letter, the purport of which seems to be, that nothing on earth contents him—not even his wife. Let him read this little anecdote.—A married gentleman, every time he met the father of his wife, complained to him of the ugly temper of his daughter. At last, upon one occasion, the old gentleman, becoming weary of the grumblings of his son-in-law, exclaimed—"You are right, she is an impertinent jade and if I hear any more complaints of her I will disinherit her." The husband made no more complaints.

"A CONSTANT READER" (Newcastle).—Alexander Pope was an admirable versifier, but his Essay on Man" contains much that is unsound in principle. The line you quote, "Whatever is, is right," contains a sentiment which is correct only in certain cases A very considerable portion of what is, is *wrong*—wrong in principle and wrong in effect, contrary to the design of the Supreme ruler, and contrary to the true happiness of mankind.

"JOHN WARBURTON" may rest assured that we shall not make our publication a vehicle for the communication of "Republicanism."

A.W.—The sponges of commerce—those well-known substances used in arts and manufactures, no less than in domestic life—belong to a class of objects which occupy the debateable ground between the animal and vegetable kingdoms.

"AN ADMIRER" should consult carefully the law of international copyright.

M. LOWE may obtain the back ——— of "The Working Man's Friend" by giving an order to any bookseller.

A FARMER'S SON addresses us on the subject of the cost of weeds, and sends us the following facts from the *Gardeners' Chronicle*:—Each plant of common groundsell produces 2,080 seeds; of dandelion, 2,700; of sowthistle, 11,040; and of spinge, 540, total, 16,360 plants springing from four weeds annually, which will cover just about three acres and a half of land at three feet apart. To hoe land costs 6s. per acre; so that the allowing four such weeds to produce their seed may involve an expense of a guinea. In other words, a man throws away 5s. 3d. a time as often as he neglects to bend his back to pull up a young weed before it begins to fulfil the first law of nature.

R. A. B. will find an article on the history and manufacture of soap in "The Illustrated Exhibitor," No. 15. Soap (says Dr. Lyon Playfair) is probably not older than the Christian era, for the soap of the Old Testament seems to have been merely alkali Profane history, previous to Christ, does not allude to soap, and in all the detailed descriptions of the bath and of washing it is never mentioned Pliny describes its manufacture, but ascribes to it as singular a use as that given to the potato by Girard, who, in his "Herbal," assures us that it "is a plant from America, which is an excellent thing for making sweet sauces, and also to be eaten with sops and wines." So Pliny, in regard to soap, states that its main purpose was to dye the hair yellow, and that men used it for this purpose much more than women.

A. TOWN.—It is not usual to place in the chair at a public meeting a gentleman who does not fully approve of the plans and objects of the conveners; and it would be strangely inconsistent for them to place in that responsible situation a gentleman who declares previously that he will not respect the opinion of the majority, should that opinion clash with his own At the same time it is possible for a majority in a large meeting to thwart the designs of the conveners, by voting into the chair a person opposed to them, or by carrying counter resolutions, or the latter expedient might be resorted to, without any change of chairman In such case the decision of the majority might bind neither the chairman nor the conveners.

A YOUNG REFORMER is anxious to know something of the Marseillaise. This stirring hymn of liberty, so universally known and sung, was composed by Rouget de L'Isle. He thus describes the circumstances under which it was written:—"I composed the words and air of this song at Strasburg on the night following the proclamation of war, in April, 1792. It was first called *Le Chant de l'Armee du Rhin*, and became known at Marseilles through the medium of a constitutional journal, published under the auspices of the unfortunate Dietrich." Rouget de Lille was afterwards "proscribed," and driven to hide himself from the emissaries of Robespierre in the mountains of Alsace. He was eventually imprisoned at the beginning of the "Reign of Terror."

T. S.—We cannot undertake to provide situations. You had better apply to some superintendent at a railway station.

A FRIEND is anxious that the duty on paper should be abolished, and requires to know how many paper-mills there are in Great Britain. According to a parliamentary report lately issued, it appears that there are 304 paper-mills at work in England, 46 in Scotland, and 28 in Ireland, in all, 380; employing not fewer than 1,650 steam-engines.

CHARLES SMITHERS.—The raw mineral produce of Great Britain and Ireland is valued, according to Sir H. De la Beche, at £24,000,000 per annum, or about four-ninths of that of all Europe. The amount of coal annually raised in Great Britain is estimated at more than 35,000,000 tons, and probably much exceeds that amount. In 1850, 2,250,000 tons of iron were produced. The annual value of the tin raised in England is £500,000, and that of copper in Cornwall and Devon alone is £900,000.

EGYPT. ITS EDIFICES AND ITS PEOPLE

III.—THE PYRAMIDS OF EGYPT

Rambling along the banks of the Nile, the traveller reaches the beautiful island of Rhoda a favourite resort of the inhabitants of Cairo On this island Ibrahim Pacha planted the celebrated garden which has since become so well known for the skill and taste displayed there by Mr Trail, an English gardener and botanist The Arabs have the tradition that it was here that the daughter of Pharaoh came to bathe when she discovered the ark of bulrushes and rescued the infant Moses from the death decreed for the male offspring of the oppressed Hebrews

At the southerly point of Rhoda is the important Nilometer by means of which the daily rise of the great river is ascertained and proclaimed during the season of inundation and directly beyond it is the usual place of ferriage for those intending to visit the pyramids From the ferry the great tombs of the kings of Egypt appear not to be more than a mile or two distant and they commonly disappoint previously formed notions of their extent and height The common explanation of this effect though hardly satisfactory, is this that these great masses of masonry stand wholly alone, on the edge of the desert without a solitary object with which the eye is familiar, to serve as a contrast or comparison Hence the spectator is readily deceived, his imagination leading him to expect more than the reality warrants, and his eye being unaccustomed to judge of heights and distances, except by comparison with well known objects, a feeling of disappointment is the natural result

The village of Gizeh or Gheza from which the Pyramids usually take their name is at present of no importance and presents nothing worthy of a visitor's attention Once it appears it occupied a position of considerable consequence and was rather distinguished for some features which are now utterly lost Williamson mentions that the custom of hatching eggs in ovens which is said to have been practised in the

THE PYRAMIDS

times of the Pharaohs is still in vogue and to those interested in such a sight it might be an inducement to spend a few hours in Gizeh The path forward winds over an extensive plain across head fields of grain and ploughed lands and small village passed with its groups of palm trees its midden stages its heaps of rubbish and filth, its pigeon or dove towers its unattractive and generally repulsive looking inhabitants now some half filled canal is crossed anon the fruits of scene Arabs of the desert are approached and frequently travellers are beset by children demanding *bukhsheesh* or annoyed by the furious barking of a pack of lean, wolfish looking dogs at

this time the pyramids are distinctly in view, and though certainly drawing nearer to them at every step, astonishment is felt by the spectator when he discovers that they are still miles distant, and that there must be a ride of some two hours before their base can be actually reached. It is not a little curious to notice how gradually the precise appearance of the pyramids unfolds itself to one's view. As first seen from the river, about six miles distant, they seem to be mere masses of stone, built up in the shape with which we are familiar, and presenting no special characteristics on which the eye rests; a nearer approach shows their outline and colour more exactly; and when within a mile, the layers of stone, the rough and broken sides of the great pyramid, and the partially smooth surface of the second pyramid, are distinctly visible. During this part of the ride, too, when on the sandy plain which has to be crossed before reaching the usual resting-place, the traveller begins to comprehend the actual state of things, and looks upon the broad and elevated rocky basis on which the pyramids stand, the heaps of sand and stones scattered about, the small pyramids, the tombs excavated in the side of the rocks, and other features of the scene, with feelings of unbounded surprise and almost inexpressible interest.

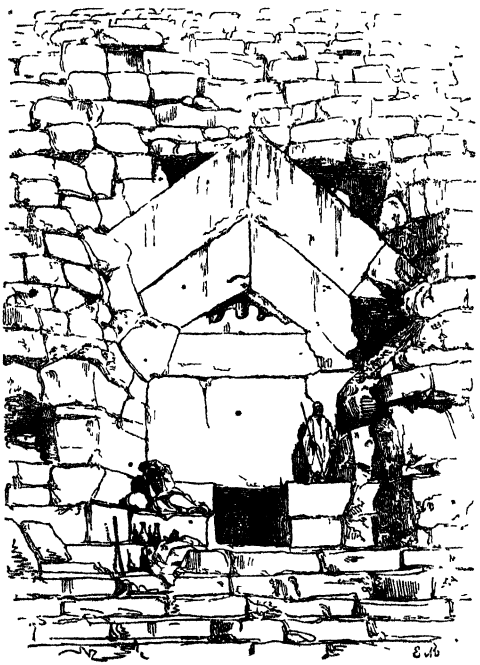
Astonishment cannot be restrained in approaching the great pyramid, as the immense blocks of stone are surveyed, and the eye looks up from one corner at the mass which towers to such a height above. It is only in this position, as the visitor stands close by, sees the layers of stone, measures them breadth, and thickness, looks along the sides or upwards towards the summit, notices the diminutive appearance of some smaller pyramids near the base, and marks the insignificance of himself and his companions, that the mind becomes satisfied that the reality is in no respect inferior to what it expected in these mighty monuments.*

What immense labour, what an amount of toil for hundreds of thousands, what astonishing skill and ingenuity, then, must have been exerted in their erection! How strange does it seem to look at the pyramids and turn the thoughts back to four thousand years ago, when they were built by the proud oppressors whose names they bear! And what a multitude of recollections come thick and fast upon the mind when it is remembered that the father of the faithful beheld these masses of stone; the children of Israel saw them; the myriads of pilgrims of all nations, ages, and climes, gazed upon them, the invader and conquerer, the Persian, the Greek, the Roman, the Saracen, the Turk, the Gaul, the Anglo-Saxon, have looked upon them, and looking, have felt their own weakness and insignificance; for here the pyramids stand in gloomy grandeur, frowning upon the pigmies of a day who come to gaze awhile at them and then go away to die—these they remain, the lasting evidences of death's triumph over man, and the puerile attempt of royal despots to provide for themselves mausoleums of imperishable renown. What a lesson do they teach of the vanity and worthlessness of this world's greatness and glory!

The ascent of the great pyramid is a far more serious matter than is usually anticipated. In the distance, the angle of the face, which is 52 deg., does not appear so great as it really is, but the nearer the approach, the more steep appear the sides, the larger the blocks of stone, the greater the height; and when a stand is taken at the base, and the spectator sees the task before him in all its magnitude and difficulty—such as it is,—he feels, perhaps, some disinclination to attempt it. If accompanied by three Arabs, one takes hold of an arm, a second of another, while a third helps him up when the stones are very large. The north-east corner is usually the point of starting, and in consequence of the fractures of the corners and sides of the stones, which have been made at various times, and the frequency of the ascent, the north side is decidedly the best and easiest to climb up. It is slow work, however, and very difficult and trying, as the stones are four or five feet thick, and afford but a narrow resting-place for the feet, on rising gradually higher and higher. Practice has rendered the Arabs so agile, that it is no uncommon thing for Bedawin to go up to the top of the pyramid in fifteen minutes; others, too, have done it in ten and twelve minutes; but half an hour is the ordinary time. Invalids, however, and bad climbers—ladies in particular,—not infrequently find, that the pleasure of standing on the summit, and beholding the scene there spread out to the view, barely compensates for the toil of the ascent.

There is something rather surprising in the fact, that the top of the great pyramid, which, from the bottom, appears only partially broken off, presents, when the summit is gained, a broad surface of between thirty and forty feet. In former times it appears that the platform was much less; and in the earliest ages, it is said, the pyramid was complete and finished up to the very apex; but, as is well known, these vast structures were used by the Saracen conquerors as quarries, from which to obtain stone for the edifices of Cairo, and consequently, not only the casing-stones, which the great pyramid is said to have once possessed, and which are partially remaining on the second, have been carried off, but also many blocks have been rolled down from the top, breaking and crushing the sides and corners of most of the layers in their descent, as well as diminishing the vertical height of the pyramids. Even when the atmosphere is not so clear and transparent as usual, Cairo, with its towering citadel and tapering minarets, is distinctly visible; and in the distance, the range of the Mokattam hills, and the quarries of Mesarah, from whence the stone used in building the pyramids was brought, add interest and variety to the scene. A grand way to the east the Nile flows onward in still majesty, and the green and fertile fields, with occasional villages here and there, contrast most strikingly with the barren Labyan desert, stretching away for many miles beyond the eye's range, and presenting a most cheerless aspect. Nearer at hand are large and rather fine bridges, built by the Saracens over canals which lead from the Nile to irrigate the country, and a prominent feature; and almost at one's side, the second pyramid, the third, and the many smaller ones scattered around, together with that mysterious idol, the Sphinx, engage the attention, and afford abundant food for serious reflection. In many respects the view is pleasing, and in all instructive. Death, decay, ruin and decay—these form the prominent characteristics; death, without hope of renewal—ruin and decay, without expectation of re-enlivening power and energy. The tombs of the dead, the ruins of once mighty cities, the scanty remains of former greatness and glory, the degraded descendants of a mighty people, all are presented before the eyes; and the words of the prophet seem to write themselves deeper than ever in the memory —

> "The sword shall come upon Egypt,
> And great pain shall be in Ethiopia,
> When the slain shall fall in Egypt,
> And they shall take away her multitude,
> And her foundations shall be broken down
> * * * * *
> Thus saith the Lord,
> They also that uphold Egypt shall fall;
> And the pride of her power shall come down;
> From Migdol to Syene, shall they fall in it by the sword,
> Saith the Lord God,
> And they shall be desolate in the midst of the
> desolate,
> And her cities shall be in the midst of the cities that are wasted.
> And they shall know that I am the Lord,
> When I have set a fire in Egypt,
> And when all her helpers shall be destroyed."*



The entrance to the great pyramid is on the north side about fifty feet above the base, but easily reached by means of the large sloping heap of stone and rubbish which has gradually been here collected during the many operations connected with opening this structure. The prospect at this point is not a little singular, yet not very inviting; for all that is visible is a narrow low passage, inclining downwards till lost to the view, and evidently not large enough to be passed through except by stooping almost double; and as it is clear that no light can penetrate, and candles must be used, the imagination may very easily take fright and conjure up phantoms of terror connected with being inside of a vast stone

* It will aid the reader to remember that the space covered by the great pyramid equals that occupied by Lincoln's-inn-fields, that is, about 550,000 square feet; and, also, that it is more than 60 feet higher than St. Paul's cathedral, the elevation of which is 404 feet.

* Ezek. xxx. 4, 6, 8.

tomb in the dark, and at the mercy of the wild Bedawin who accompany travellers to light them on their way and aid them in the difficult places. The masonry over the entrance is noticed by Sir Gardner Wilkinson as very singular: two large blocks resting against each other form a sort of pointed arch, and serve to take off the superincumbent weight from the roof of the passage; they also manifest very clearly the care and skill, as well as the advanced state of architectural knowledge possessed and exercised by the ancient Egyptians. At the right hand, just beside the entrance, is a tablet covered with hieroglyphics, done by Prof. Lepsius in honour of the king of Prussia and queen of England,—a most singular addition to the pyramid, and one which Lord Nugent and others severely and justly criticise, as in bad taste and quite out of place.

The direction of the opening and all the passages is in a due north and south line, and the traveller in going downward at an angle of 27 deg. for about eighty feet, sometimes slips over the smooth stones under his feet, and very soon feels the change in the temperature and the annoyance of the dust, which is here rather abundant. At this point may be noticed the forced passage which has been made by those who opened the pyramid, and were unable to remove a granite block which closed the entrance to the upper passage; and as they could not enter at the proper point where this passage joins the lower, they forced a way into it by following out the roofing, and cutting away the upper part of the side of the lower passage. This circumstance obliges the visitor to climb up a few rough steps, when he finds himself in a passage ascending at precisely the same angle as that by which he has come thus far has descended. The second or upper passage is of the same dimensions as the first, which continues its course downwards to a subterranean chamber in the solid rocky basis of the pyramid; but it wants the finish and polish of the first passage: its length is rather more than a hundred feet. Here is the entrance of the "Grand Gallery," as it has been termed; the entrance to "the Well," which communicates with the lower or first passage, being on the right hand; and another passage branching off horizontally, and leading to what is called the "Queen's Chamber," being directly in front. Continuing the ascent, at the same angle of 27 deg., through the "Grand Gallery," which is a wide and lofty opening extending to a considerable length, a horizontal passage is reached, which, as Wilkinson says, was once closed by four portcullises of granite, sliding in grooves of the same kind of stone; they served to conceal and stop the entrance to the "King's Chamber." Its length is 34 feet 4 inches; its breadth 17 feet 7 inches; its height, 19 feet 2 inches. The roof is flat, and formed of nine long blocks of granite, which extend from side to side. The side-walls are also of granite blocks in six regular courses, admirably united at the joints, and perfectly even and polished. This is the principal apartment in the great pyramid, and has an imposing effect upon the mind, as well from its size as from the consideration that it is probably the very burial chamber of the king who built this mausoleum for his own remains.

ENTRANCE TO THE GREAT PYRAMID.

The measurement of the sarcophagus is as follows: length outside, 7 feet 5 inches; breadth, 3 feet 2½ inches; height, 3 feet 3 inches. It is of the red granite, and has no hieroglyphics upon it, and no cover. Whatever it may have contained in former days, it is now empty; and here it stands, a strange monument of the instability of kingly power, since all this vast structure, as is supposed, was built to contain the perishing dust of a monarch whose remains have long since, we know not when, been carried off, and scattered to the four winds of heaven. The sarcophagus has been much injured by the culpable conduct of visitors, who are usually desirous to carry away some relic of the pyramid, and who have not scrupled to break off pieces from one of the corners, to an extent which, if continued, will ere long destroy it entirely. How strange is it that there is an entire absence of hieroglyphics where, above all places, they might be expected to be found. May it not be, after all, that the secret of the pyramid has not yet been discovered? Is it not possible, that where so much skill and care has been displayed in everything, to keep out intruders, and to conceal from all eyes some sacred spot or object, that there is yet something to be discovered which will throw light upon points, even to the present day much debated, and far from being satisfactorily ascertained? Perhaps time will reveal what is now hidden from the wise and learned labourers in the field of Egyptian history and antiquities.

Descending from the "King's Chamber," through the "Grand Gallery," there is the horizontal passage already noticed above, as leading to the apartment called the "Queen's Chamber." this passage is less than four feet in height, and three feet five inches wide, a fact which obliges the visitor to stoop and creep along in a manner extremely disagreeable, especially when it is continued for a hundred feet or more. But he is permitted to stand upright once more in the "Queen's Chamber." It is not a large apartment, and its roof is formed of long blocks of stone, resting against each other, as those over the entrance of the Pyramid. The stones in the side-walls are finely fitted or joined together, and the chamber wears the appearance of having been hewn out of the solid rock, which, however, is not the case. Perhaps the most striking thing in connexion with this apartment is the fact, that it is directly under the apex of the Pyramid, whereas this might rather have been expected to be true of the "King's Chamber." At this point, according to Wilkinson, the visitor stands seventy-two feet above the level of the ground, four hundred and eight feet below the original summit, and seventy-one feet below the floor of the "King's Chamber."

There are other things in the interior of the great pyramid which are worthy of notice. Among these are the entresols or chambers discovered by Colonel Vyse, above the

PYRAMIDS

"King's Chamber," and which are reached by means of a ladder, or some wooden steps, now partly destroyed; and also the tortuous and irregular passage, named "the Well," which reaches down to the passage first entered from the outside. It is nearly two hundred feet deep, and, according to Wilkinson, was used by the workmen by way of egress, after they had closed the lower end of the upper passage with the block of granite above spoken of; though this seems to be hardly a sufficient explanation of the original purpose of forming this passage. Should the reader feel curious on the subject of the pyramids, more information will be found in the elaborate volumes of Colonel Vyse, the excellent work of Sir Gardner Wilkinson, the useful compend of Dr. Russell, and the learned treatise of Champollion Figeac, entitled "*Egypte Ancienne*." All these writers go into detail, and bring to bear on the subject a great amount and variety of learning and acuteness.

On emerging from the interior a most impressive sight is presented by the pyramids, the multitude of tombs on every side and the Sphinx, that most striking image, which rivals in interest the vast structures near which it stands. Perhaps no collection of monuments in the wide world has so many claims upon the traveller as this, for none can equal in antiquity in impressiveness, in gloomy grandeur. Here, all is ruin and decay, everything manifests the triumph of death and the mutability of human affairs. The whole plain is filled with the marks and proofs of death! the pyramids as is thought and with great probability, were mausoleums the rocky sides of the elevation on which they stand abound in excavations for tombs, and hundreds of pits or burial places have been dug in the vicinity of the pyramids, and besides all these, the sands of the great desert have swept over everything covering many objects entirely from sight and lying in heaps and great masses in every direction as far as the eye can reach. Truly, this were a fit place to muse over the past and musing, to lay up in store lessons of sound wisdom and instruction, truly, this were the place to burst forth in the words of the accomplished and ill-fated Raleigh — O eloquent, just and mighty Death! whom none could advise, thou hast persuaded, what none have dared, thou hast done, and whom all the world have flattered thou only hast cast out and despised thou hast drawn together all the far stretched greatness, all the pride, cruelty, and ambition of man and covered it all over with these two narrow words hic jacet." * *

ANECDOTES OF THE LION

The noble appearance prodigious strength and determined spirit of the lion justify the sovereignty assigned him as 'the king of beasts.' In the boundless desert, the dense jungle, and the long grass plains of Africa he roams at will with agile yet muscular frame, while the lord of all the animal tribes

> "Where'er he prowls all living creatures fly
> Here earth's best part with his rolling eye, —

Even when, by smell the cattle are aware of his presence, they display the greatest alarm. Though worn out with fatigue and hunger the moment the shaggy monarch is perceived, they start off at full speed with their tails erect, and so great is their panic that sometimes days will elapse before they are found.

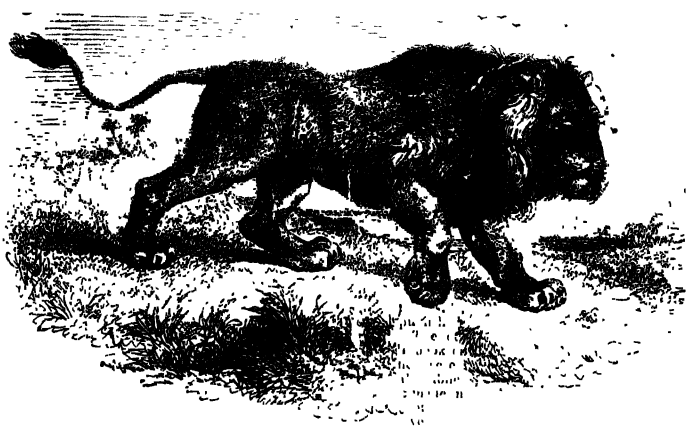
Like the varied tribe to which he belongs the lion is nocturnal in his habits. Sleeping during the day, it is at night he goes forth—

> "Grandly majestic in his lonely walks."

With unerring instinct he scents his prey, and follows it in its course then suddenly he crouches, he springs even to the length of twenty or thirty feet, he forces his fangs into the throat of his victim and, though massive is the strength of the elephant, and dense the armour of the rhinoceros, there is not for either, any chance of escape, —

> "And lo ere quivering life has fled,
> The vultures, wheeling overhead,
> Swoop down to watch, in gaunt array,
> Till the gorged tyrant quits his prey."

As the lion rests his head on his paws or on the ground, an emits a half-stifled growl, the vibration is conveyed to a great distance. The sounds heard from him when captive in a menagerie



Here he has

are whispers, compared with his thunders when roaming in his native wilds. "One night," says Mr. Moffat, the missionary, "we were quietly bivouacked at a small pool on the Oup river, where we never anticipated a visit from his majesty. We had just closed our united evening service, the book was still in my hands, and the closing notes of the song of praise had scarcely fallen from our lips, when the terrific roar of the lion was heard. Our oxen, which before were quietly chewing the cud, rushed upon us, and ran over our fires, leaving us prostrated in a cloud of dust and sand. Hats and hymn-books, our Bibles and our guns, were all scattered in wild confusion. Providentially, no serious injury was sustained. The oxen were pursued, brought back, and secured to the waggon, for we could ill afford to lose any"

The following is no less characteristic. A settler in South Africa was proceeding with his party, from Algoa Bay to his location of Glen-Lynden. The night was extremely dark, and the rain fell so heavily that, in spite of the abundant supply of dry firewood which had been happily provided, it was not without difficulty that they could keep one large watch-fire burning. A sentinel was appointed as usual; and all but he were buried in sleep, when about midnight the roar of a lion was heard close to their tents, and so loud and tremendous was it, that it seemed for a moment to those it so suddenly aroused, as if a thunder-cloud had broken close beside them. But the peculiar expression of the sound, the voice of fury as well as of power, instantly undeceived them, and springing to their arms, they hurried out, fancying that the savage beast was about to break into their camp. But all around was total darkness, and scarcely any two of them were agreed as to the quarter from whence the roar had issued. This uncertainty was owing partly, perhaps, to the peculiar mode the lion often has of placing his mouth near the ground when he roars, so that the voice rolls, as it were, like a breaker along the earth; partly, also, to the echo from a rock which rose abruptly on the opposite bank of the river; and more than all, to the confusion of the senses in the party being thus hurriedly and fearfully awoke from their slumbers. Having fired several volleys in all directions around the encampment, they roused up the half-extinguished fire to a blaze; and then flung the flaming brands among the surrounding trees and bushes. It is probable that this unwonted display daunted the grim visitor, for he occasioned no further disturbance during the night.

A few days afterwards, some of the party had gone a mile or two up the valley to cut reeds for thatching the temporary huts proposed to be built; and were busy with their sickles in the bed of the river, when, to their dismay, a huge lion rose up amongst the reeds, almost close beside them;—the formidable cause, probably, of their previous alarm. The lion leaped on the bank, and then turned round and gazed at the men. One or two of them who had guns, seized them hastily, and began to load with ball; the rest, unarmed and helpless, stood petrified; having no other expectation than that the lion would soon make sad havoc among them. But, from some cause or other—he might recently have dined, or, perhaps, he was as much surprised as they were—after gazing for a minute or two (a dreadful pause!) at the intruders on his wild domain, he turned about and retired; first slowly, and afterwards proceeding for some distance at a good round trot; while the on-lookers were much too prudent to interfere in the slightest degree with his retreat,

The following incident, illustrative of the lion's perseverance in watching, and tenacity in retaining his prey, occurred to another party. The wagons and cattle had been put up for the night, when, about midnight, they were thrown into complete confusion. About thirty paces from the tent stood a lion, which walked very deliberately a few paces further behind a small thorn-bush, carrying something with him which those looking on took to be a young ox. They fired more than sixty shots at the bush. The south-east wind

blew strongly; the sky was clear; and the moon shone very brightly, so that anything might be perceived at a short distance. After the cattle had been quieted again, and the chief of the party had looked over everything, he missed the sentry from before the tent. On calling as loudly as possible, but in vain, he came to the melancholy conclusion that the poor man had fallen a prey to the invader. Three or four men then advanced very cautiously to the bush, which stood exactly opposite the door of the tent, to see if they could discover anything of the sentinel; but they returned helter-skelter; for the lion, who was still there, rose up and began to roar. A hundred shots were again fired at the bush, without, however, there being any appearance of the lion. This induced one of the men to approach the bush with a fire-brand, and as he advanced, the lion roared terribly, and leaped at him; but the monster was compelled to retire by the fire-brand, which was instantly hurled at him, and the shots by which he was assailed.

The fire-brand fell into the midst of the bush, and, favoured by the wind, it began to burn with a great flame, so that those assembled could see into the bush and through it. They continued their firing into it; the night passed away, and the day began to break, which induced every one to fire at the lion, as he could not lie there without exposing himself. Some men, posted at the furthest

wagons, watched, to take aim at him as he came out. At last, just before it became quite light, he walked up the hill with the dead body of the sentinel in his mouth; about forty shots were fired without hitting him; and, persisting in retaining his prey amidst the fire and shot, he carried it securely off. But short-lived was his safety; he was followed and killed before noon, while standing over the mangled remains of the unfortunate sentinel.

Of one deliverance there is a remarkable acknowledgement. Under the will of Sir John Gager, who was Lord Mayor of London in 1646, provision is made for a sermon to be preached annually, on the 16th of November, in St. Catherine Cree Church, Leadenhall-street, in commemoration of his providential deliverance from a lion, which he met in a desert, as he was travelling in the Turkish dominions, and which suffered him to pass unmolested. In addition to the fees directed to be given to the minister, the clerk, and the sexton, £8 16s. 6d. is to be distributed among the necessitous inhabitants It would be well were such providential interpositions in times of imminent danger, always followed with such evidences of true and fervent gratitude.

Few particulars in regard to the lion need now be added. His distinguishing marks are the presence of a shaggy mane and a tuft at the end of his tail. These appendages do not appear for some time while the animal is young, and four or five years elapse before they acquire their full and bushy state. The lioness is considerably smaller than the lion, but her form is much more slender and graceful.

The most remarkable distinction of the lion of India is, the very pale tint that pervades his whole body; it approaches almost to a fawn colour, and it is still paler on the under parts of the body and the insides of the legs. The mane is scarcely so ample as it is in the lion of Africa; but it is furnished with a peculiar appendage in the long hairs which, commencing beneath the neck, occupy the whole of the middle line of the body below. The size of the creature is also somewhat less; and he is considered generally inferior to the noble animal on whose character and qualities we have more particularly enlarged.

WHAT INDUSTRY CAN DO.

A TRUE STORY.

We are often driven to fear, if not to confess, that calculation and foresight are not, generally speaking, very decided elements in the character of the working classes. Too many of them—especially in our rural districts—seem to think that they are born to a certain doom, to wear away their youth and manhood in hard and unceasing toil, and then to finish their career in the union workhouse, in workhouse clothing, on workhouse diet, and, last of all, when life is [illegible] are carried in a workhouse coffin to the grave by the [illegible] paupers. Can nothing be done to wean their minds from such a degrading fatalism? It is true that a working man's life is a continued battle with the circumstances by which he is surrounded. He has little to save upon, and little to spend upon. To make both ends meet he considers a great achievement. He seldom attempts, because he considers it to be impossible, "to lay by anything for a rainy day." But why is it impossible? Has he ever tried? Has he ever, indeed, calculated whether it could be done, or how it could be done? Here let us set our arithmetic against his.

Only a day or two ago we met John Stubbins, a labourer in our village, coming from the little shop with a bundle of pipes in his hand, and a paper parcel filled with tobacco. Now John Stubbins is an awful smoker; he is as untiring with tobacco as Dr. Johnson was with tea. We have often talked to him about his carrying the habit to such an excess, but hitherto, we regret to say, to no purpose. On this occasion we again referred to the subject. "What, John!" we observed, "more tobacco? Why, man, you must puff away more than a new coat a year." At this he smiled, "Oh no, sir, nothing [illegible]." "Well, how much a day do you spend upon it?" "[illegible]y so much; not a farthing more." "Well, John, you only spend so much a day on pipes and tobacco. Now there are three hundred and sixty five-days in the year, and three hundred and sixty [illegible]times only so much make ——;" and here we had a sm[illegible] which would not only have bought the new coat of which we had spoken, but a waistcoat and hat into the bargain. John looked very foolish at hearing this, and not less so when another labouring man, who had been listening to us, observed, with a sly and quiet look,

And then, sir, you forgot to count in that he always wants something to wash it down with." And then we began to make our calculation over again, taking in not only so much for the *tobacco*, but also so much for "the *something to wash down with*," and this time we found that the sum-total amounted to enough to buy not only the articles aforesaid, but a full suit for John himself and a gown and shawl for his wife, and bonnets for his three little girls.

We must say for him, that when he saw his selfishness placed before him in this new light, he looked very much ashamed of himself, and said, "It was a sight of money to waste, and he had never thought of it before;" and he left us with a half promise that he would instantly begin to amend by knocking off a pipe a day, and renouncing "the something to wash it down with" altogether.

But another of our villagers, and another sort of man, now approaches as we part from John, with as much fear as hope about his carrying out his resolutions of improvement. The new comer is George Holdfast, a hale, hearty-looking man, six feet high, all sinew and bone, without a bend in his back or a grey hair on his head, and hardly a furrow on his brow, although sixty-six years have passed away since his battle of life commenced. We wrote over our story, by way of title or starting post, "What industry can do." And here is a proof of it. It is a kind of Aladdin's lamp to its possessor, and enables him to accomplish with ease what appear to be marvellous things to less energetic spirits.

Let us see what it has done for the man before us. It has not made him a George Stephenson nor a Sir Joseph Paxton, because he is utterly uneducated, unable either to read or write. But still, in the face of these disadvantages, we shall find that it has done much for him, and, comparatively speaking, in a very short time. George Holdfast never was an idler or lounger, but from his youth as hard-working a labourer as ever followed the plough or took spade in hand. He was, however, a long time before he knew the value of money. If, up to almost forty years of age, he worked like a horse, he also, to use his own emphatic description of himself, lived like an ass. In short, he toiled and played with equal energy. If there were a fair, a feast, or a wake within his reach, he was sure to be at it; and wherever the fun was "fast and furious," he was certain to be the hero of it. And so he went on for years upon years, as thoughtless, reckless, and thriftless a fellow as ever lived. But happily this state of things did not last for ever—

"A change came o'er the spirit of his dream."

Circumstances—what they were we never heard exactly—led George Holdfast to think, and he began in his serious moments to reflect upon the folly of his past career, and to call to mind how much of valuable time, and substance, and strength, and health, he had expended upon trifling and unsatisfactory pleasures. He determined to give them up, and turn over a new leaf; and his resolution once taken was carried into effect for he was a man with an iron will as well as an iron frame. From that time he was never seen at fairs and feasts. He forsook the public house, renounced his idle habits and evil companions, and when his day's work was over, was invariably to be found at his own fireside, almost as decided a fixture as the grate itself. The change soon began to tell. Small as are the wages of an agricultural labourer, he speedily found himself before the world with a little spare money in his pocket. He now felt himself a made man.

"The world was all before him, where to choose
His place of rest."

What was he to do with his riches? How was the village Rothschild to invest his capital? *Savings banks* had not then—they have not even yet—penetrated the district in which our hero lived. He despised *clubs* and *benefit societies*. What, then, was he to do with his treasure? He would add to it. But how? A navigable river flowed near the village in which he resided, and there was also a canal within three or four miles, and on both of these a man owning a horse might find constant employment in towing vessels. As soon as this

thought occurred to him, it was acted upon. With the nest egg of his first savings he bought such a horse as his money would command. And now, for a time, he devoted himself to harder labour than many men would like to undertake. Often and often, when his fellow-workers were in bed resting after the toils and fatigues of the day, would he be engaged on this additional occupation, and then hurry home to catch hours' sleep before the labours of the to-morrow

occurred. He was enabled to buy an acre, a whole acre of land, in the richest part of the richest country in England, and from that hour to this he has never looked back, but kept swimming on with the stream of industry, constantly up, adding little to little, and more to that, until he has reached the point which he now occupies. Had he been an educated man, he would have certainly been a *rich* one, and, it may be, a *great* one. As it is, he is a *comfortable* man, being now the owner of three acres of the choicest land, worth a hundred pounds per acre, of his own, and a tenant holding fourteen more, having as snug a roof over his head as it is possible to describe, it being also his own property, and being the possessor likewise of one horse, one cart, three cows, as many heifers, and six pigs. George's consequence has also grown with his circumstances. He has been summoned to serve on juries. He is a freeholder, and on the eve of an election always talks of his stake in the country, and of the advantages of a good and cheap government. His politics are of the "jumble" order, being, unknown to himself, very radical with a dash of the conservative in them. He is, as an agriculturist, a protectionist in theory, but at the same time is thankful that he has enough to live upon, and thinks that his fellow-labourers "in the west country," as we here call the manufacturing districts, have as much right to live as he has, and certainly ought not "to pine." He also attends parish and vestry meetings, at which he enforces economy on all occasions, denounces the highways rate as unnecessarily burdensome, being of opinion that "those as drives fine coaches should make fine roads," and as to the poor rate, he is forcibly eloquent against its amount, regarding the union workhouse in our part of the country as a cunningly devised scheme for raising emoluments for guardians, inspectors, relations, and doctors. George sits, too, in his own pew in the parish church on a Sunday, and it is a glorious sight to behold him as he walks across the church-yard in all the magnificence of his Sunday suit. His coat is the admiration of the children and the envy of the men. And what a coat it is! The quantity of cloth contained in it is something incredible. As it streams in the wind, it seems to have more of length and depth and breadth in it than even the famous blue surtout in which the late Sir Robert Peel used to walk down to the House of Commons. It rather reminds us of the mainsail of a small man-of-war flapping in the wind.

But we spoke of George being a *comfortable* man. He is so in every sense of the word. Some two or three years ago we found him one day surrounded with workmen in his cottage. They were taking up the brick flooring of a little inner room which he was about to turn into a parlour, and a nice little snuggery he has made of it, being now boarded, with a warm carpet over it, because, as he says, "one likes to feel comfortable and keep away the rheumatiz in one's old age."

Nor would we for all the world omit to state, that when the correspondent or commissioner of the *Morning Chronicle* for the agricultural districts was in this part of the country, inquiring about the condition of the labouring classes, he one day walked into George's cottage to question him on the subject. He was fresh from some of the southern counties where the people barely exist, but can hardly be said to live, and expected to find the same wretchedness in our district. Amongst the first questions, therefore, which he put to George, he asked, "Do you ever get *meat* to eat?" Patience! A tornado broken loose could not have made such a noise as the thunder clap of laughter which George laughed at this question. The commissioner thought he was mad, while we had terrible fears of apoplexy, choking, or a ruptured bloodvessel. His wife, however, came to the rescue, and quietly answered, "George would think it hard indeed, sir, if he did not get his meat three times a day." The commissioner stared at this, and he stared more as she showed him over her three neat little bedrooms and other comforts of the cottage. And then she took him into the little snuggery aforesaid, and there, while he was admiring the clock in its grand mahogany case, and the tables and the chairs and the carpet, she, as she pretended, carelessly and accidentally, but in truth very cunningly and purposely, in the cunning of her proud heart, threw open the door of a huge and capacious cupboard, with shelf upon shelf covered with tempting pork pies, enough to have dined the flank companies of all the regiments of guards, and then shelf upon shelf again with her best china for company days. The commissioner fancied that he had at last found the labourer's paradise. And so he had. George is not "alone in his glory." Happily, in this part of the country there are many others of his class striving, with more or less success, to walk in the same path.

We have only to add that even yet, when not occupied on his own land, George goes out to work as a labourer just as he did at first. We ourselves farm a few acres, and invariably employ him for the benefit of his practical knowledge and experience; and we can with truth affirm, that under his auspices our green crops, our potatoes, our wheat, oats, and beans are at least as productive as those of any of our neighbours. We might say more; but we are not proud, and we do not wish to turn George's head.

In what we have now stated, we have not inserted one line or one word drawn from imagination or fancy, but have kept strictly and literally to facts. We have always had a high opinion of the force and power of industry. We have seen it misused and abused by thousands, who have then charged their wretchedness and disappointment upon fate or fortune. They have thrown away opportunities, been careless and extravagant, travelled through waste to want, and then accused everybody and everything except themselves and their own improvidence. While all the time, had they continually saved little by little, and so added little to little, they would have lifted themselves above the world's frowns and escaped from inclining misery. We have seen before them an example which teaches them that this *has* been done, and therefore *can be* done again—an example which muses its warning voice against idleness and recklessness, as it proves—"WHAT INDUSTRY CAN DO."

LITERARY FORGERIES.—From information derived from another source, it appears that the recently published "Shelley Letters," recently published with a preface by Robert Browning, are forgeries. The letters were sold by two women to Mr White, the bookseller in Pall Mall, who gave a large price for them. They were afterwards purchased at Messrs. Sotheby and Wilkinson's public sale by Mr Moxon of the publisher. The discovery was made in a curious manner. Mr Moxon had sent a proof-sheet to Mr Tennyson. During a visit which Mr Palgrave was paying to Mr Tennyson he dipped into the Shelley volume, and recognised a letter written from Florence to Godwin, the latter half of which had before appeared as part of an article on Florence written by the Quarterly Reviewer," so far back as 1841. In his father Sir Francis Palgrave. This led to further investigations, which brought out facts proving the letters to be forgeries. The *Athenæum* has stated that there has been of late years a great many such forgeries of letters purporting to be written by Byron, Shelley, and Keats—that these forgeries can only be detected by a minute mask of genuineness is have deceived the astutest body of London collectors—that they are executed with a skill to which the forgeries of Chatterton and Ireland can lay no claim—that they have been sold at public auctions and by the hands of booksellers, to collectors of experience and rank—and that the imposition has extended to a large collection of books bearing not only the signature of Byron, but notes by him in many of their pages—the matter of the letters being selected with a thorough knowledge of Byron's life and feeling, and the whole of the books chosen with the minutest knowledge of his tastes and peculiarities. But the marvel of the forgery is not yet told. At the same sale at which Mr Moxon bought the "Shelley Letters," were catalogued for sale a series of (unpublished) letters from Shelley to his wife revealing the innermost secrets of his heart, and containing facts, not wholly dishonourable facts to a father's memory, but such as a son would wish to conceal. These letters were bought in by the son of Shelley—the present Sir Percy Shelley—and are now proved to be worthless fabrications got up for sale.

SCULPTURE.

Among all nations and peoples—the rudest equally with the most refined—representations of the human form have ever found especial favour. From the remotest antiquity have been recovered evidences which show the universality of this feeling. The grinning idol of the savage, and the classic groups of Greece and Rome have similar signification, because they exhibit the impulses of the human heart, which seeks in visible forms and outward ceremonies the invisible and inward yearnings for the true and beautiful

By the word sculpture is understood the art of carving or cutting any material into a proposed shape or form. Though it is generally applied to those works produced in marble and stone, to the moulding and modelling of clay—called the plastic art—and the casting of metals and other materials, the all peoples. From a remote antiquity the art of sculpture has been continually practised; and ancient as well as modern nations have made all kinds of materials subservient to its advancement. Thus we find, recovered from ruined palaces and desecrated tombs, the remains of figures, both human and animal, vases of all shapes, pedestals, lamps, and architectural ornaments, in marble, wood, ivory, basalt, terra cotta (literally baked earth), porphyry, stucco, granite, wax, clay, and the different kinds of metals.

All objects in sculpture may be classed under one or other of the following heads:—The production may be a figure or group, which stands by itself, and may be viewed from all sides, when it is technically called a "round;" or it may be partially raised from a back ground, in which case it is called a *relievo*. The degrees of relief, as defined by modern artists, are *alto* or high relief, where the objects project so as to be

THE PLAYMATES, BY C. MULLER OF BERLIN.

word is also used occasionally in reference to engraved gems and the larger kinds of works produced by the goldsmith.

To trace the history of sculpture, we should have to travel backwards to almost the infancy of civilisation, and recount the triumphs of awakened man over the barbarisms of ignorance and slavery. The recent discoveries of Messrs. Botta and Layard, among the mounds of earth which once formed the city of Nineveh, have brought to light many highly-wrought specimens of sculpture, and there is even reason to believe that the art was practised before the flood. Indeed, the ruins of India and central America sufficiently attest its antiquity. Almost as universal as language, the art has risen from the rude forms of idol worship to a perfection which commands the admiration of the educated and refined among nearly distinct; *mezzo* or half relief, where not more than the face and half the figure is raised from the ground on which it is sculptured; and *basso*, or low relief, in which the chiselled figures are but slightly raised from the back-ground. There is also another variety of relief, which is found principally among the Egyptian and Syrian antiquities. The outline of the figures is sunk into the ground-work or plane of the material, and the different parts are then rounded off in the same manner as in *basso-relievo*. In works produced by this method, no parts project beyond the original face or ground of the stone; and to produce peculiar effects in this kind of *relieved intaglio*, the ancient artists were in the habit of introducing colours into various parts of their sculptures.

Having already said that various materials are used in the

production of sculptures, we will endeavour to explain how, from a rude block of marble, the artist is enabled to produce those life-like representations of the human form which delight all beholders. We cannot in our small space attempt to speak of the various schools of art, or the famous works of the ancients; we must therefore confine our remarks to the mechanical process necessary to the artist in marble—leaving the explanation of iron and bronze-casting for a future paper.

FIRST LOVE. A MARBLE STATUE BY ALBERT WOLFF, OF BERLIN.

Having conceived and determined on his subject, the first object of the artist is to produce a representation of it on paper. He then goes on to make a model, *in little*, in clay, wax, or some equally plastic material. If this model be well built—

The model complete, the next process is the erection of another clay figure, the exact size of the intended group or figure. A sort of skeleton or frame-work of wood or iron is made to assume the rough outlines of the statue, and on this is moulded—by means of certain simple instruments aided by the artist-mind and hand—the clay or other material into the forms designed. Now, whether it is intended that the statue should be draped or not, it has been usual with some sculptors to make their models nude; but this plan has not been adopted to any great extent among modern artists except where it has been necessary to show the muscular or other development beneath the drapery. It is said of Chantrey

THE FIRST STEP. BY PIETRO MAGNI, OF MILAN.

that his knowledge of anatomy was inferior to his skill in the disposal of clothes; and it will be recollected, probably, that his statues generally are dressed in the modern costume. To obtain the necessary grace and accuracy, draperies are usually placed upon lay figures, the details of which are *copied* by the artist; though in some few instances a living model is preferred.

When the clay figure has sufficiently dried and shrunk, a mould is made of it by covering it all over with gypsum or

plaster of Paris. After the plaster has become dry and hard, the clay within is carefully removed, and the result is an exact mould of the original design. After being carefully washed, the interior of the mould is brushed over with a composition of oil and soap, and then completely filled in its parts with a semi-liquid mixture of gypsum, which in a few days becomes so throughly hardened as to allow of the removal of the outer body or mould. Means similar to the employed by all artists, and thus is obtained an exact counterpart of the original clay model. A careful examination of the process as above detailed will, it is to be hoped, enable our readers to comprehend how the many plaster figures which they have seen at the Great Exhibition and elsewhere have been produced.

Having made his plaster cast, the sculptor may then transfer it to marble or other material. Technical rather than inventive skill, however, is necessary to produce the marble figure; and it is not by any means uncommon for the sculptor to confide this part of the work to other hands, reserving to himself merely the right of superintendence, till the figure approaches completion.

Having selected a proper block of marble, the first step is to what is called *point it out*. By means of a long steel needle attached to a pole or standard, and capable of being withdrawn or extended, loosened or fixed, by means of joints, &c., the exact situation of numerous points and cavities in the figure to be imitated are correctly ascertained. Pencil marks on the block of marble are made to show where such and such points occur in the model, and this process being repeated till the various distances to which the chisel may penetrate are discovered—in fact, till, in the technical language of the studio, the figure is entirely *pointed out*—the marble is rudely blocked out, and the future statue begins to assume something like an intelligible shape. A superior workman, called the carver, now takes the figure in hand, and with extreme care copies all the minute portions of the model. By means of chisels, rasps, files and sand paper, he brings it to that state of semi-completeness in which several works were exhibited at the Crystal Palace. The sculptor then assumes his full authority, and gives the finishing touches to the statue, which [illegible] work of a master hand and mind. Among the ancients it was not unusual for the artist to begin and complete his work, but the demands of the present day would not allow of such an expenditure of time, even were the sculptor willing to perform the laborious tasks of the carver and blocker-out. The ancients, there is reason to believe, produced their grandest effects by the chisel alone; among the moderns the file and the sand-paper are the roughest instruments which approach the surface of the work. Indeed, as before stated, it is to the perfection to which the clay model is brought that the success of the finished performance is due. Harmony of effect, beauty of expression, gracefulness of form and attitude, consistency of detail, and finish of surface, belong as much to the painter as the sculptor; both of whom, to achieve complete success, must possess genius and industry, taste and perseverance, fire and patience in almost equal degrees.

THE MURDER OF THE INNOCENTS. BY G. G. ADAMS.

These prefatory remarks leave us but small space to speak of the illustrations we have introduced into this article. The originals all appeared in the Great Exhibition, we have little need therefore to be over-critical.

In the "MURDER OF THE INNOCENTS" Mr Adams has in no wise departed from the conventional type—an armed figure, a distressed mother, and an almost indifferent child, nevertheless, there is much to be admired in the vigour of thought displayed in this group. It is the fault of English artists and a characteristic of the national character—that they seem afraid to give vent to all their fire. Whenever you look at a picture or a piece of sculpture by an Englishman, you cannot help thinking that in some particular the story is not all told. You gaze upon it, and drink in the sentiment of the episode, and pass away with the thought that that man can do better things. Of course there are exceptions to this, as to every other rule; and if we do not, in all cases, embrace the whole idea, we do not, in any, commit those extravagances so common among foreign artists—the "Phryne" of Pradier, for instance, a more detestable piece of vulgarity and extravagance than which, notwithstanding the award of the Council Medal, was never carved in marble. We speak of the idea and not of the execution of this figure.

Although we cannot speak without reservation of Mr. Adams' group, it must not be supposed that we introduce it into these pages merely to condemn it. On the contrary, there much in it to commend, much to admire, much that a young artist would do well to emulate. The attitudes are free and vigorous, and the *posé* of the group unexceptionable. Two other artists chose the same subject, and it would be difficult to say which of them rendered it most happily. The visitor to the Exhibition, recalling the memory of each, must make his own selection.

Of the "FIRST STEP" little need be said, though much in the way of commendation might be advanced. Belonging to a less ambitious class of subjects than many which were exhibited by Raphael Monti and others, there is in this group nothing to detract from the honourable fame achieved by its author; but, on the contrary, as it appeals to the sympathies of a far larger audience, it will be remembered by hundreds of thousands on whose minds the representation of nude female figures, polished up to the last degree of finish, have made but small impression. The "PLAYMATES" also deserves high commendation for the grace and freedom of outline, and the entire naturalness—if we may be allowed the expression—which characterises the whole composition. FIRST LOVE is also an expressive and well-executed statue, which never failed to find admirers from among visitors of all ages.

Did it come within the compass of our space we should gladly attempt to review our impressions as to the sculpture in the Great Exhibition; but it does not. That it was creditable to the English as a nation there is little doubt, and that, had there been longer time allowed for preparation, the specimens would have been far more numerous and possibly of a somewhat higher character as a whole, appears equally certain. Into the relative merits of the various sculptors who exhibited we have no desire to enter—that task has already been sufficiently well performed by the jurors of Class XXX.; but we must say, in conclusion, that the "EVE" of Bailey, the "VIRGIN AND CHILD" of Fradier, and the "VENUS" of Canova are before the world as specimens of the artistic genius of England, France, and Italy, and none can say that one is greater or less than the other.

HOW HENRY BROUGHAM WAS MADE LORD CHANCELLOR

SOME curious revelations are made by Mr Roebuck, in his "History of the Whig Ministry." The following will be read with interest. After speaking of the reform crisis in 1832, Mr Roebuck tells us that "Lord Grey, when commanded by the king to form an administration, obeyed the injunctions of his majesty with the belief, 1st, that without Lord Brougham's co-operation he could not form an efficient government; 2ndly, that there was no objection on the part of the king to Mr Brougham's receiving some important office. Under this impression, the first list of the proposed administration and its friends submitted to the king contained the name of Mr. Brougham as Master of the Rolls. To this arrangement, it is said, the king immediately and peremptorily objected. That the king should have so positively prohibited this arrangement, certainly seems strange. That the king had no invincible objection to Mr. Brougham, was made plain by the result. Why, then, should he, the king, have objected to his being Master of the Rolls? The office is certainly permanent, and he who holds it may sit, and often has sat, in the House of Commons; and Mr. Brougham, with such a permanent office and a seat in the Commons, would have been truly formidable, but not as regarded the king. The king would have had no reason to fear him. The persons who, under such circumstances, would, indeed, have had good cause for alarm were his whig friends, and from them would the objection most naturally come. But, nevertheless, the king himself, according to the statement of Lord Grey to the person most interested, did spontaneously and peremptorily object. An offer was in the meantime made to Mr Brougham, through Lord Duncannon, with which the world became, in some manner not explained, acquainted, and on which most of the imputations which the opponents of Mr. Brougham so freely cast upon him entirely rested. Lord Duncannon was commissioned to inquire whether he would accept the office of Attorney-General. This offer was at once positively and (it is said) *calmly* refused, upon which Lord Grey declared that his hopes of being able to frame a cabinet were at an end, and waited upon his majesty for the purpose of communicating to him the failure of his negotiation, and the impossibility now of forming an administration. 'Why so?' was the king's inquiry. 'Why not make him Chancellor. Have you thought of that? The answer was, 'No—your majesty's objection to the one appointment seems to preclude the other.' 'Not at all, not at all,' was the king's reply. The reasons for the one appointment and against the other were said to have been then very clearly stated by his Majesty, and orders were given to offer Mr Brougham the seals. Up to this moment no other communication than the one above described had been made to Mr. Brougham by or on behalf of Lord Grey, and up to this moment it was the intention of Mr. Brougham to retain his distinguished position in the Commons, untrammelled by office; and when, from the marked lead he had taken in all the proceedings of the opposition, men were naturally led to ask and speculate upon what was to be his position in the new order of things, he quite as naturally attempted to satisfy the public curiosity respecting himself. He had done this in some degree on the 16th of November, when he consented to postpone his motion respecting reform; and again on the 17th, when Sir Matthew White Ridley proposed to postpone certain inquiries into election petitions, because of the absence of the ministers, Mr Brougham took occasion to define the independent position he desired to hold, by saying—'He (Sir M. Ridley) says that ministers will not be in their places, and that therefore we cannot proceed. But I here beg leave to differ from the honourable baronet. We can do many things in these days without the assistance of ministers, and with respect to election petitions, we can do just as well without them as with them. I speak this with all due respect for the future administration, and with all due respect for the distinguished persons of whom it may be composed, and who will undoubtedly govern the country upon right principles. I have nothing to do with them except in the respect I bear them, and as a member of this house. I state this for the information of those who may feel an interest in the matter.' Having thus attempted to satisfy the curiosity of those who felt an interest in the matter, and having again on Friday, the 19th of November, presented petitions and spoken on them in the Commons, Mr. Brougham certainly surprised the world by suddenly, on the next Monday, November 22nd, appearing as Lord Chancellor in the House of Lords. This sudden change in the determination of Mr. Brougham resulted chiefly from considerations of party. Had he thought solely of himself, he could not but be aware of the great personal loss which he sustained by his elevation to the peerage. If the statements, however, made by Lord Grey were correct—if the successful formation of the whig administration depended upon Mr Brougham's active co-operation, and if his refusal would have led to the reconstruction of the old tory ministry—then, indeed, we need not be surprised to find that Mr. Brougham should shrink from incurring the lasting anger and active enmity of the whole whig party by keeping aloof from them, and thereby preventing them, perhaps, for another quarter of a century, tasting the sweets of office. For thus ran the argument of those whig friends who induced him to accept the offer of the seals.—'If you refuse, Lord Grey will finally declare to the king that he is unable to form a cabinet. The whole whig party will ascribe this evil result to your selfishness. That circumstance upon which you insist as your chief pride, and which gives you your present power and importance—viz., the representation of Yorkshire—will only belong to you for the present parliament. A contest at the next election will be inevitable, and your whig friends will be either hostile or lukewarm. The enormous expense of a Yorkshire election is beyond the power of your purse, and you will have, therefore, to return, if you can find one, to some presentation borough or populous town. Your proposed measures, too, of reform will never be so likely to succeed as by the endeavours and under the auspices of a government pledged to bring forward and support some large scheme of parliamentary reform. As the chancellor of such a ministry, you will be called upon to render a service to the cause of reform which no other man can render, and which you cannot render in any other character. We see, and we acknowledge, the personal sacrifice we ask you to make. We know that if you simply look to personal considerations, if you think only of your own influence apart from all considerations of the public good, you will remain in the House of Commons, and wield the great power which your singular abilities confer upon you as a member of that house. But we appeal to higher motives, asking you to think less of yourself and more of your country, and to adopt that course which will give effect to the principles which during your whole political life you have endeavoured to advance.' This argument, thus skilfully employed, produced the effect desired, and Mr. Brougham passed almost directly from the bar of the house at which he had as counsel been engaged when this argument was used, to the woolsack, and took his seat as Lord Chancellor before the patent that created him a peer was made out."

SIR JOSHUA REYNOLDS.

The histories of painters and poets are written in their works. There is seldom much of incident or excitement in the story of their lives—at least in the lives of those among them who have achieved the measure of success which entitles them to be ranked among the world's great And it is well that it should be so, for it is surely more interesting to read of their triumphs over the difficulties that beset their paths, than to find them interfering with matters which belong rather to diplomatists, statesmen, politicians, grave talkers profound thinkers, and the active spirits who make up the sum and substance of what is known as 'the world' They there fore, who expect to find the poet or the painter taking part in the questions which interest the generality of mankind or sharing in the hopes, feelings and passions of their contempo raries, will, in the greater number of cases be doomed to disappointment It is true that the complexion of the poet's works—and the painter must always be considered in the lights of a poet, a creator—will almost necessarily be tinged with the colour of the times in which he lived yet for the most part, it will be found that he has looked deeper than the surface, and has sought inspiration at founts which are sealed and hidden from the general crowd Thus it is that the artist mind appears to stand alone and isolated as it were, while all is busy active stirring heart-en grossing life around him Thus it is that we must judge of the poet—not by comparison with the minds of other men but rather with reference to the soul absorbing occupation to which he has devoted his anxious days and feverish nights If we search the annals of the past we shall discover the poet standing out from among his fellows as a bright star amid the nebulæ—as a light shining clear and steadily through the shadows of time The poet must be a teacher, or he is nothing But not always in his lifetime is the poet honoured Not always is his worth allowed Not always is his presence recognised Not always are his teachings listened to On the con trary, it has happened often times that a Homer has begged his bread from door to door though seven cities may have claimed him as their own when nothing remained of him but his bones and the imperishable utterings of his heart

SIR JOSHUA REYNOLDS

And so when we are speaking of the poets a Virgil or a Raphael, a Tasso or an Angelo or a Shakspere or a Milton or a Byron or a Reynolds—we must bear in mind that they are a peculiar race—a people apart a strange inconsistent order of beings, whose faults and failings and whose very virtues must not be judged by the standard common among men These remarks, however, apply rather to the general subject than to the painter whose portrait we here present to the reader They may be borne in mind, however when, in perusing the lives of men of genius we discover traits of character and eccentricities of behaviour not altogether reconcilable with our previously-formed notions

Sir Joshua Reynolds was born in the town of Plympton, in Devonshire, on the 16th of July, 1723 His father, the Rev Samuel Reynolds, was master of the Plympton Grammar school, and a man of more than ordinary acquirements Under the care of his father—who was taciturn and absent, and no more of a disciplinarian than scholars usually are—the youthful Joshua received his only education At an early age, how ever, he discovered germs of the genius which was afterwards to distinguish him, and before he had arrived at his seventeenth year, had given such decided proofs of a liking and fitness for the painter's art, that his father consented to place him under the care of Thomas Hudson, then the most celebrated portrait painter in London It appears, however, that the master had more skill than knowledge of his profession, and was not pos sessed of the requisites necessary for a teacher After staying with him two years, during which time he had sufficiently advanced in his art as to feel himself competent to paint portraits, the youthful artist returned to his father's house in Devonshire where he soon began to attract considerable notice His separation from Hudson may, indeed, be con sidered a fortunate circumstance, as it enabled him to strike out and pursue the path in which he afterwards became so famous

In 1749 he accompanied Captain, after Lord Keppel, in a voyage up the Mediterranean At Minorca and other places at which the vessel stopped he employed himself in painting portraits, and s well were his finances recruited by these means that he was enabled to ac complish the pilgrimage without which no artist education is considered complete To Rome, then the student wends his way and there surrounded by the triumphs of the great past his mind was enlarged and improved It is said, however that he was not at first so thoroughly imbued with admiration for the works of the old masters as might have been imagined He himself confesses that despite his early enthusiasm he was disappointed at the first sight of the works of Raphael in the Vatican 'Notwithstanding my disappointment, he says in his notes to the works of Du Fresnoy (published in 1782), "I proceeded to copy some of those excellent works I beheld them again and again I even affected to feel their merit, and to admire them more than I really did In a short time a new taste and new perception began to dawn upon me, and I was concerned that I had originally formed a false opinion of the perfection of art, and at the time having frequently revolved the subject in my mind I am of opinion that a relish for the higher excellences of art is an acquired taste which no man ever possessed without long cultivation great attention, and much labour'

On his return to England he painted a whole length portrait of his friend and patron, Commodore Keppel This was so much admired by the town, that Sir Joshua rose at once into popularity, and took higher rank as a painter than any since the days of Sir Godfrey Kneller

The history of Sir Joshua Reynolds from this period is but a record of art successes So greatly was his style admired, that the highest personages in the land deemed it an honour to have their portraits painted in it He was probably the first English portrait painter who, while he preserved the likeness of the sitter in the most exact manner, so idealised and refined his subject as to render the finished picture of far higher value as a work of art than as a mere portrait In fact, the English

school of portrait painters may be said to have been founded by Sir Joshua Reynolds.

In that best of all biographies, "The Life of Samuel Johnson, LL.D., by James Boswell, Esq.," and in other works of the time, we have frequent glimpses of Sir Joshua. Now, it is at his house in Newport-street, Covent-garden, where, in 1758, his time became so valuable as to oblige him, in the words of Johnson, to "raise his price to twenty guineas a head;" now among the associates of the Literary Club, founded by himself and Dr. Johnson; now at a dinner at the Crown and Anchor, in the Strand, in company with Goldsmith and Dr. Burney; and, lastly, in the painter's own house in Leicester-square, to which he removed in 1761, in which his greatest successes were achieved, and in which he died. This house afterwards became the residence of the Earl of Inchiquin, and was till lately occupied by the Western Literary and Scientific Institution. Hogarth, John Hunter, and Sir Isaac Newton also lived in Leicester-square, which has been classic ground to the poet ever since.

To give anything like a list of the pictures which Sir Joshua painted about this time, would exceed our limits. The visitors to the National and Vernon Galleries, and the privileged few who have the right of gazing at the Queen's collection at Buckingham Palace, the fine gallery of pictures belonging to the Earl of Grosvenor, in Grosvenor-square, and the pictures in the halls of the City companies and the houses of many of the aristocracy, will remember how they have stood in silent admiration before the "Tragic Muse," the "Age of Innocence," "Cymon and Iphigenia," and portraits innumerable.

On the institution of the Royal Academy, in 1768, Sir Joshua was unanimously elected president, and at the same time he received the honour of knighthood at the hands of his sovereign. Though the task of delivering public discourses was no part of the president's duty, Sir Joshua voluntarily undertook the duty. In distributing the prizes to the students on one occasion, he told them how it was that he determined on the delivery of lectures.

"If prizes are to be given," said he, "it appears not only proper, but almost indispensably necessary, that something should be said on the delivery of those prizes, and the president, for his own sake, would wish to say something more than mere words of compliment, which, by being frequently repeated, would soon become flat and uninteresting, and being uttered to many would at last become a distinction to none. I thought, therefore, if I were to preface this compliment with some instructive observations on the art, when we crowned merit in the artists whom we rewarded, I might do something to guide and animate them in their future efforts." Thus were produced those fifteen admirable discourses which have ever since been considered as models of just criticism and profound knowledge of art. From the foundation of the Royal Academy to the year 1790, Sir Joshua contributed no fewer than two hundred and forty-four pictures.

In his private life this great painter was of an eminent literary and companionable nature. He was the friend and patron of his less fortunate brethren, and, through his incessant industry, he became the possessor of an ample fortune. After his death, which happened on the 23rd of February, 1792, his pictures and works of art, collected with great care and taste from various parts of Europe, were sold for £16,947 7s. 6d. He was buried in the crypt of St Paul's Cathedral, near Sir Christopher Wren, the great architect of the building, and a statue, from the chisel of Flaxman, has since been erected to his memory.

"Sir Joshua Reynolds," says the illustrious Burke, "was one of the most memorable men of his time. In taste, grace, facility, happy invention, and the richness and harmony of colouring, he was equal to the ancient masters. In portraits he went beyond them; for he communicated to that description of the art a variety, a fancy, and a dignity, derived from the higher branches, which even those who possessed them did not always preserve. His paintings illustrate his lessons, and his lessons seem to be derived from his paintings. He possessed the theory as perfectly as the practice of his art. To be such a painter, he was the profound and penetrating philosopher. In the full affluence of fame, admired by the learned in science, courted by the great, caressed by sovereign powers, celebrated by distinguished poets, his native humility, modesty, and candour never forsook him. His talents and social virtues rendered him the centre of a variety of agreeable societies, which were dissipated by his death. He had too much merit not to excite some jealousy—too much innocence to provoke any enmity. The loss of no man of his time could be felt with more sincere, general, and unmixed sorrow."

FUNERAL CEREMONIES.—Chapter I.

By Xanthus.

The local customs observed at funerals, like those of marriage, of which we have already spoken [see Vol. I., p. 306], are also greatly modified by climate, race, religious opinions and civilisation; and will ever be deemed an interesting subject of investigation, since in all countries their observance affords to survivors a last opportunity of testifying their affection and respect for the beloved friends of whom the hand of death has deprived them. There is something wildly mournful in the ceremonials which are still kept up by many of the negro tribes in Central Africa. When the head of one of their families has breathed his last, his more distant relatives are summoned to wail over him by the loud cries of a female who goes about for this purpose tearing her hair, whilst the body is washed with oils and wrapped in straw mats and cotton cloths ready for interment, after which the different relatives assemble around it. The friends continue their audible lamentations over the deceased until the following day, when, amidst the beating of drums and violent shrieks of hired women, the remains are deposited in an oval shaped hole in some lonely forest, which is then surrounded by thorns to deter wild animals from molesting it. These women are afterwards treated with palm wine, and for eight succeeding days they collect round the grave, morning and evening, to weep aloud; often saying to the dead man, "Hadst thou not wives, and arms, and horses, and pipes, and tobacco, wherefore then didst thou leave us?" In some places the negroes build a hut under ground in which the corpse is placed with supplies of food, water, and tobacco, and to the roof, which projects above-ground, are fastened the bow and arrow and lance of the deceased, these preparations being made, because they believe the soul of the departed frequently returns to the body for some time, after which they think it passes into some other form. A woman's grave is occasionally distinguished by a pestle and mortar being affixed to the roof, and the burial places of both sexes are ever regarded with great veneration, whilst an African prince is honoured by interment in his own habitation, and the anniversary of his death is dutifully commemorated by the reigning prince, who annually visits his abode, and offers up prayers, while he throws millet into the enclosure.

The Hindoos preserve many singular customs, and it is curious that amongst them cloth-dealers and weavers alone bury their dead, in all other cases the funeral rites are performed as soon as possible after decease, because those of the same household may not eat until they are concluded, they resemble those of the Africans, inasmuch as hired women, who tear their hair and shriek, continually attend. A Brahmin first ties a species of dog-grass, considered sacred, round the dead man's finger, purifies the house with holy water, and prayers are offered up, whilst fire is brought into the room, and cow-dung thrown into it, and the Brahmin whispers the ceremonial of initiation in the ear of the deceased. The principal mourners while this is being done, cause their heads to be shaved, in the hopes of thereby increasing the happiness of the departed in the next world. In the evening a hole is broken in the outer wall of the house, through which the corpse is carried, placed in a sitting posture upon an open sedan-chair; and preceded by torches and mournful blasts of long trumpets. On arriving at the cemetery, the friends, with praiseworthy caution, make sure that life is certainly extinct, and then throwing rice, butter, betel, and fruit on the pile, the body having been first laid on it, the oldest relative present sets fire to the wood, and the corpse is consumed amidst loud wailing, music, and funeral songs. The ashes are afterwards collected and thrown, if possible, into one of the sacred rivers, such as the Ganges, the Kishna, and the Jumna, and which has previously received the ashes of the deceased's ancestors. Inferior castes, however, sometimes omit

the burning, and wrapping their dead in a coarse white sheet bury them like the Europeans do, only they shave their beard, head, and mustachios, and for several days fast from chewing their favourite betel. The inhabitants of some of the large Asiatic islands keep the corpse much longer, even the poorest, for several weeks, those of persons of rank being detained from burning for one to two years; and the interment of members of the royal family is attended by a terrible barbaric custom of sacrificing by the hands of executioners a certain number of their household slaves, selected by the king from the crowd of eager devotees, for those who do not thus offer themselves are imprisoned for life, the chosen ones are then put to death by the dagger before the royal corpse arrives at the burning pile. This long preservation of the body probably arises from the dislike naturally felt by all to be deprived of the last relics of the departed, which by many of the Hindoos are borne away for ever by their sacred streams, but in New Holland, now better known as Australia, and where dead bodies are also sometimes burnt, the ashes are carefully collected and buried in spots marked by logs of wood More commonly, however, the natives of that immense island place their dead in canoes without burning, along with a spear and a throwing-stick, and they are thus borne to the burial-ground whilst the attendants wave long tufts of grass backward and forward, as if exorcising evil spirits The canoes are placed in grass-lined graves to the music of drums, great care being observed in placing the canoe so as to let the sun shine on it; intercepting shrubs being cut down to facilitate the free passage of its rays; and small shrubs are planted over the grave when covered in, which is also distinguished by boughs and tufts of wild grasses.

Quitting these pagan nations, the still uncivilised hordes of Russia and her dependencies seem to afford a natural bridge for our passage over the gulph which divides the observances of heathenism from those of christianity, as it exists in more cultivated portions of the globe. As soon as death has taken place in Russia, a priest anoints the body with incense, to the accompaniment of prayers and sacred songs; and those who can afford it pay for a succession of priests to carry on similar religious observances day and night, until the interment, which generally takes place about eight days after death. Before the coffin is closed, every one kisses the departed; and a benediction having been pronounced, and incense poured on all present, the bier is carried into the church, preceded by choristers, and tapers born by priests The 91st Psalm is sung, followed by the prayers and anthems of the Greek church, said to be often exquisitely beautiful; and when the body is lowered into the grave, the funeral anthem to the Trinity is duly performed, whilst the priest throws dust crosswise on the coffin, and pours oil from his lamp on its lid, the ceremonial concluding with a prayer for the everlasting happiness of the deceased. Sometimes a religious commemorative service is conducted in the church on the third, ninth, and fortieth days after the funeral, and another is celebrated annually, in addition, so long as the mourners survive. In some savage tribes drink mead at the grave from a bowl, with wax tapers stuck round the rim, their women at the same time keeping up a species of musical howl, and every one bowing to the ground and crossing themselves repeatedly; and the Siberians burn candles over their sepulchres, and not unfrequently dig away the earth from them at night, in order to introduce food into the sepulchre, money being buried with the dead, in the expectation that they will need it wherever their souls are gone.

A singular source of revenue to Spanish monastries arises from the sales of monks' and nuns' habits, in one of which every corpse except those of the grandees is interred. A public coffin is also kept in each church, which is used on all occasions, the body being buried without one, and it remains open while on its way to the burial-ground, and a rosary is placed in the hands of the deceased, or, if it be a young unmarried woman, she wears a crown of flowers, and carries a palm-branch in her hand. The sorrowing parents of children who die under seven years of age are obliged to listen to congratulations, since baptism is supposed to insure the entrance of their offspring into the kingdom of heaven. When they die before human beings become responsible—a period which the catholics have determined lasts seven years—the remains of these infant children, who are called "little angels in Heaven," are crowned with flowers, and dressed in white, as is the officiating priest; the bells ring joyful peals, and the thanksgiving Psalm is uplifted, "*Laudate pueri, Dominum*," whilst no mourning garb is permitted to the bereaved relatives who follow their darlings to the tomb. An ancient custom is still observed in Spain of erecting crosses on the highway to the memory of those who perished by the hands of brigands, and the peasantry, as they pass them, throw a stone on the heap at the foot of each cross. In the Dutch states, the funerals of the rich commonly take place at night, by the light of large lanterns, a canopy sheltering the open car containing the hearse, and, if the deceased died unmarried, white gloves are worn—and black gloves if married. Numerous mourning coaches and a large retinue of undertakers generally attend, who are attired in the deepest mourning. But in country places, interments are conducted very simply, a common wagon generally conveying the coffin, as well as the nearest relatives. When young children are buried, bunches of flowers are fastened to the coffin, and the boys carry in his mouth a green twig, whose leaves are afterwards strewn over the grave, and, after this part of the ceremony, the undertaker frequently returns thanks for their attendance to the friends assembled round the grave, who thence depart to their separate homes In some cases the company return to the house of mourning, and partake of old Rhenish wine in goblets of green glass, used only on these mournful occasions—a custom in other districts compounded for by presenting each of the company with drink money at the grave In Zeeland or Friesland much feasting goes on at funerals, and is thought to be a remnant of ancient customs when banquets used to be prepared amongst the northern nations after death had occurred, to propitiate the manes of the departed In the South Sea Islands the savage custom is still maintained of survivors manifesting their sorrow for a deceased relative by bruising themselves with their fists, cutting and wounding themselves with clubs, stones, sharp shells, and knives, and striking their heads so violently as sometimes to occasion a temporary loss of reason. Their chiefs are buried in vault lined with large stones, and they are usually eight feet long, six wide, and eight deep, and a kind of shed is erected over the grave, from which are suspended pieces of stuff with black stripes, the coarseness of the material being considered emblematic of deep grief When the mourners return from the burial-ground, they sing aloud, that all who may be in the adjacent roads or fields may have time to hide themselves, as the sacrilege of looking on a funeral procession is punishable by death on the spot; and the same wild people evince their regret on losing a friend by burning their cheek bones, the places being rubbed with astringent juice, and the blood thus produced smeared round the wound to the diameter of two inches, and similar strange customs are often carried on for twenty days after the death of one of their chiefs. In Otaheite, when a person is known to have expired, the relatives assemble immediately to weep over the dead body, and the next day it is wrapped in cloth, and carried in a bier to the sea-shore, where the priest prays aloud, and sprinkles water around, but not on the corpse. This is repeated several days, whilst a shed is erected, different in size, according to the rank of the deceased, in which the body is then placed, and left to waste away till the flesh is wholly gone These sheds are adorned with garlands, and pieces of cloth and food are kept close at hand, the former being supplied to receive the tears of the mourners, as a sort of oblation. They also cut off and throw their hair into the bier. Finally, the bleached bones are delicately washed, wrapt up in cloth, and buried. These funeral observances vary considerably in the different islands of the Indian Archipelago, and the inhabitants of Sumatra testify their regard to the departed in a mode much more consistent with our notions of propriety on such sorrowful occasions. Each village possesses its own cemetery and its own broad plank, constantly kept painted with limes, on which the dead are conveyed to their resting place, swathed in white cloth. After the grave is dug, a cavity is cut in one side, just large enough to hold the corpse, which is laid within it, covered with flowers, and protected by two boards, fastened angularly to each other, one resting on the body, while the other fills up the open side of the cavity, its edge touching the bottom of the grave. When the excavation is filled up, small white streamers and shrubs, bearing a white flower, or marjoram roots, are neatly planted over the grave, which is duly visited by the survivors on the third and seventh days, and at the end of twelve months two or three long elliptical stones are placed at the head and foot, on which occasion a buffalo is dressed and devoured, its head being left there to decay in testimony of the honour which has been paid to the deceased in feasting to his memory.

SCIENTIFIC FACTS.

WONDERFUL PROVISION OF NATURE.—Although eels, notwithstanding their voracity, are not, perhaps, very destructive to salmon in their active state, their habits are such that they would exterminate the species, were it not for a very singular provision of nature, which, as we do not remember ever to have seen it dwelt upon or alluded to, it may be worth while to notice in passing. The history of their spawning is the converse of that of the salmon's, for whilst the latter is oviparous, and produces in fresh water, the former is viviparous, and produces in the sea, and it so happens that when the salmon is hurrying up towards the very sources of rivers on the great errand of generation, the eel is hurrying on the same errand to the depths of the ocean. Were the eel to remain in the river after the salmon roe is deposited, and covered in, its voracity, and habit of boring in loose gravel, and even under large stones, would disturb the beds, and lead to the annihilation of the whole salmon tribe. But at this critical time the two creatures are driven, by the same instinct, towards different poles; and before the eel re-appears in fresh water the salmon roe has undergone a series of transmutations, emerged from its sub-aqueous dormitory, and becomes a little fish, fragile, indeed, and tiny, but in the highest degree vigilant and nimble—not capable of confronting a single one of its numerous enemies in the open field, yet disconcerting and [illegible] by the celerity of its flight. Is this an evidence of [illegible] a stroke of chance?

THE FORMATION OF PEARLS.—These jewels of animal origin, so highly prized for their chaste beauty, are only to be rejected or superabundant secretions of a shell-fish, consisting of concentrically disposed layers of animal matter and carbonate of lime. In most instances they are consequences of the attempts of irritated and uneasy mollusks to make the best of an unavoidable evil, or, rendered uncomfortable—their peace of mind and ease of body destroyed—by some intruding and extraneous substance—a grain of sand, perchance, or atom of sphincter shell—the [illegible] in a smooth coated phrase of [illegible] way. Would that these bipeds could treat our troubles so philosophically, and convert our secret cankers into splendid treasures! It is not to be wondered at that the generality of naturalists ascribed the production of pearls to other causes than the true one, believing them to be congealed and petrified drops of rain drop falling from heaven into the cavities of gaping shell-fish, thereby supplying the poets with a suggestive hypothesis, out of which many a beautiful verse and quaint conceit has sprung. There is, indeed, a version of malacology peculiar now to the poets, but originally derived from the fanciful dreamings of unobservant zoologists, or their credulous acceptance of the narratives of superstitious fishermen and exaggerating travellers. To it belongs such pretty but imaginary actions as the voyages of the nautilus, floating, with outspread sails and paddling oars, on the surface of unruffled seas, the terrestrial expeditions of the cuttle-fish, and the dew-drop theory of pearls. Long after such errors had been investigated and exposed, and consequently expunged from the text-books of scientific students, they return a tenacious hold of more popular treatises, and keep their accustomed place in the compilations put into the hands of children. Indeed, a general revision of all the pretended facts of science, stereotyped, as it were, in schoolbooks, is becoming more and more desirable every day.

PREPARATION OF PHOSPHORUS FROM BONES.—M. Donovan, in the *Philosophical Magazine*, recommends the following as the easiest and cheapest processes for obtaining phosphorus:—"Take of dense bones, crushed or broken into small pieces, as many pounds as may be deemed sufficient—say 10 avoirdupois pounds. Digest them in a mixture of six pounds of commercial nitrous acid and five gallons of water for a few days. When the bones feel perfectly soft and flexible, strain off the liquor, and add to it eight pounds of sugar of lead dissolved in a sufficiency of water. An abundant precipitate will appear, wash and dry it by heat in the manner already directed. Its bulk will be reduced to one-half if it be heated red-hot in a crucible. Mix it well with one-sixth of its weight of fine charcoal-powder or lampblack, and distil out of large earthen retorts properly prepared. The phosphate of lead resulting from the above process would, according to my trial, amount to 91¼ ounces avoirdupois. Giobert states that 100 parts of phosphate of lead, precipitated from urine by acetate of lead, afforded from 14 to 18 parts of phosphorus. If this be a correct estimate, the 91¼ ounces should return from twelve ounces to one pound of phosphorus. A large quantity of cartilage is also obtained, which is well calculated for making size, glue, and for many other purposes. The following is a shorter, neater, and less troublesome, although a little more expensive process for obtaining phosphorus, which may be employed when the quantity required is not very large. Take of unburnt shavings of hartshorn 1 avoirdupois pound; digest it for hours in a mixture of 17 ounces weight of commercial nitrous acid and one gallon of water. Strain the liquor, and add to it 1¼ pound of sugar of lead previously dissolved in a sufficiency of water, mix, and let the precipitate subside. Pour off the supernatant liquor, dry and wash the precipitate as already directed; mix it with one sixth of charcoal powder or lampblack, and distil as before. The charcoal-powder or lampblack will in all cases afford a better product if previously well calcined in a crucible covered with sand, or in any close vessel. The waste of phosphorus, by solution in the gas evolved during the subsequent distillation, will thus be much lessened, and the same end will be further promoted by a previous exposure of the phosphate of lead to an obscure red-heat, which will also cause a reduction of bulk to one-half."

IMPROVEMENTS IN THE MANUFACTURE OF BOOTS.—Mr. P. Wibley has recently enrolled a patent for improvements in the manufacture of boots and in rendering them waterproof. The specification describes a new method of nailing and pegging the heels of boots and shoes, secondly, a method of producing a new material from scraps of leather and other substances, and, thirdly, an improved method of waterproofing. The machinery for nailing and pegging is described at length, but the *rationale* is simple. The heel of the boot is placed in a recess or cavity, made to receive it, in the upper plate of a fixed frame, and is secured there by a screw and last above. There are a number of small holes or perforations through a plate immediately under the heel of the boot; these agreeing in number and position with piercing tools, attached to a vertical slide, which being raised by the eccentric, the tool-plate will rise with it, and piercing-tools pass through the holes, and penetrate the heel of the boot upon the downward movement of the vertical slide, the tools will be withdrawn, the action of the eccentric will now be suspended for a time. The attendant then slides the tool-frame so as to bring the second part of it over the vertical slide. This second part is somewhat similar to the first, and contains the nails or pegs previously placed in small recesses in the block, in which, under the nails, are also mandrills. The [illegible] the eccentric, and [illegible] upon the vertical slide, the tools [illegible] the nails or pegs into the holes in the heel of the boot previously made by the piercing tools. The descent of the vertical slide enables the boot to be removed and replaced by another, to undergo a like operation. The second part of the specification is forming a composition of scraps or pieces of leather with gutta percha or caoutchouc. The scraps or cuttings of leather are first well washed in warm water; then taken out and partially dried, then steeped for a time in a solution of size or glue until fully saturated. It is then placed in a box or trough, the bottom and sides of which are perforated with holes to allow the escape of the superabundant portion of the solution. While in the box, it is submitted to a very considerable pressure to consolidate it. It is then taken in the state of a hard block to a cutting or rasping machine, which consists of apparatus [illegible] worked somewhat like a chaff-cutting machine. By [illegible] the composition is reduced to fine scraps or shreds; it is then steeped in warm water, and well washed to remove the glue. The washed shreds are then combined with melted gutta percha or caoutchouc in proper proportion, and reduced to a state of sheet or plate, by passing it between rollers, to any desired degree of thickness for the purposes required, and then used for many purposes to which ordinary leather is applicable. The third part is a mode of rendering boots and shoes waterproof. This is by [illegible] thin sheets of gutta percha, and laying them over the lasts previous to the formations of the boots or shoes.

THE NIZAM'S DIAMOND.—The *Calcutta Englishman* has the following from a correspondent at Hyderabad:—"The Nizam has contributed a large rough diamond, weighing seven tolabs, towards the payment of his debt to the company. The diamond was conveyed to the minister the day before yesterday, and was yesterday brought to the resident, it is supposed, as part payment of the debt, and I hope it has been accepted. Taken in round numbers, the diamond weighs 100 carats, and is the largest diamond next to the Brazil diamond. The Koh-i-Noor, I have heard, weighs but 300. The diamond of the Nizam will not permit of its being cut into a perfect brilliant, and I therefore presume that the cutting being adapted to its shape, it need not lose more than one-fourth in the operation."

CURRENTS OF WATER.—The distance to which currents can transport solid matter in the ocean may be well illustrated by the wash of the gulf stream which sweeps from the Guinea coast by the Gulf of Mexico, and then traverses so great a portion of the North Atlantic, for it carries timber and tropical fruits within the influence of the littoral indraughts of Iceland, Norway, and Ireland. Major Sabine's observations on the sea-current of the Maragnon, show, at a distance of 300 miles from its mouth, the fresh water of that mighty river floats on the heavier water of the sea, and retains its earthy discolouration.

MISCELLANEA.

AN INTELLECTUAL YOUNG LADY.—"Oh, mamma, I asked Miss Brown, what is dew? She says it is the moisture imbibed by plants during the nights of the summer months. Now, mamma, dear, dew is the condensation of aqueous vapour by a body which has radiated its atomic motion of caleric below the atmospheric temperature."

HORRID AMERICAN DEPRAVITY.—A base wretch, in the *form* of a man, was a few weeks since introduced to a lovely and confiding girl of sixteen. He pressed her hand, and said, in a thrilling tone, that he thought the "recent fine weather had rendered the ladies more lovely than ever" She blushed, and said, "Very." Her parents considered the matter settled, but he basely deserted the young lady, after addressing this pointed language to her, and has never called at her house since We are glad to hear that her friends have taken the affair in hand, and caused this monster to be arrested in a suit for breach of promise—damages laid at 6,000 dollars The scamp will be cautious in future how he trifles with the affections of young ladies, and break in fragments their loving hearts—the toughest muscles, by the way, in the whole body!

AN UNIMAGINATIVE WIFE.—Jean Paul Richter gives us the portrait of a wife who could count the strokes of the town-clock between his kisses, and could listen and run off to the saucepan, that was boiling over, with all the big tears in her eyes which he had pressed out of her melting heart by a touching story or a sermon She accompanied in her devotion the Sunday hymns, which echoed loudly from the neighbouring apartments, and in the midst of a verse she would interweave the prosaic question, "What shall I warm up for supper?" and he could never banish from his remembrance that once, when she was quite touched, and listening to his cabinet discourse upon death and eternity, she looked at him thoughtfully, but upon his feet, and at length said, "Don't put on the left stocking to-morrow—I must first darn it."

LIFE ASSURANCE.—It unfortunately happens, as no man believes he is likely to die soon, so every one is much disposed to defer the consideration of what ought to be done on the supposition of such an emergency, and while nothing is so uncertain as human life, so nothing is so certain as our assurance that we shall survive most of our neighbours. But it may, indeed, occur to any that the chances are very nearly balanced as to his dying at forty, and his reaching the uncertain age of forty-five, and that even five years may make a considerable difference in the amount of savings he may bequeath to his family The determination to lay by often creates the power to lay by, and the first effort is the most difficult Let it always be remembered that, in purchasing a life policy, a man purchases a certain amount of mental tranquility, and thus he may actually extend his life by providing against the results of his death.

EASY TO TAKE.—Dr Goldsmith having been requested by a wife to visit her husband, who was melancholy, called upon the patient, and, seeing that the case was poverty, told him he would send him some pills which he had no doubt would prove efficacious He immediately went home, put ten guineas in the paper, and sent them to the sick man The remedy had its desired effect.

SENSIBLE LADIES.—The young ladies of Damariscotta, in the state of Maine, have recently formed themselves into a society for mutual improvement and protection. Among the resolutions adopted at a regular meeting, we find the following:—"That we will receive the attentions of no 'so-styled' young gentleman who has not learned some business or engaged in some steady employment for a livelihood. For it is apprehended that after the bird is caught, it may starve in the cage. That we will promise marriage to no young man who is in the habit of tippling, for we are assured that if he indulges that vice his wife will come to want, and his children go barefoot. That we will marry no young man who is not a lover of literature, for we have not only strong evidence of his want of intelligence, but that he will prove too stingy to provide for his family, educate his children, or encourage the institutions of learning."

STRENGTH OF HUMAN MUSCLES.—Robert Francois Damiens, who attempted the assassination of Louis the Fifteenth, in 1757, after suffering the most unheard of tortures, was sentenced to be drawn in quarters by four horses But although they exerted their entire strength, by drawing in four directions upon his limbs, for *fifty minutes*, the muscles were not torn from their attachments, and being still alive, the executioners were obliged to cut the tendons with a knife in order to answer the law, which was that the criminal's body should be drawn in quarters. Precisely the same course was resorted to in the case of Ravaillac, who assassinated Henry the Fourth, the horses being unable to dismember the criminal's body.

THE BUSINESS OF THE RICH.—Surely that gentleman is very blind, and very barren of invention, who has to seek for work fit for him, or cannot discern many employments belonging to him, of great concern and consequence It is easy to prompt and show him many businesses indispensably belonging to him, as such. It is his business to administer relief to his poor neighbours, in their want and distress, by his wealth It is his business to direct and advise the ignorant, to comfort the afflicted, to reclaim the wicked and encourage the good by his wisdom It is his business to protect the weak, to rescue the oppressed, to ease those who groan under heavy burdens, by his power—to be such a gentleman and so employed as Job was, who "did not eat his morsel alone, so that the fatherless did not eat thereof," who "did not withhold the poor from their desire, or cause the eyes of the widow to fail," who "did not see any perish for want of clothing, or any poor without covering," who "delivered the poor that cried, and the fatherless, and him that had none to help him"

CHARITY.—Open thy hand to the poor ding to thy ability. Meddle not with other men's occasions but where thou mayst do good, and hast a calling to it And if it be in thy power to hurt thine enemy, let it pass, do him good if thou canst, and boast not of it he that sees thee in private will openly reward thee Lastly, let thy heart be kept always in awe of this want of charity, by continually remembering that thou hast of thy Saviour no other form of prayer to desire forgiveness for thyself, than that wherein thou covenantest to forgive others All the other petitions we present to God absolutely only this is conditional, that He forgive us as we forgive others Our Saviour hath taught us no other way to desire it; and, in Matthew he shows God will no otherwise grant it.

ANSWERS TO CORRESPONDENTS.

CHARLES.—A Language (say French) is the [illegible] which a thousand precious and subtle thoughts have been safely imbedded and preserved. It has arrested ten thousand lightning flashes of genius, which, unless fixed and arrested, might have been as bright, but would have also been as quickly passing and perishing as the lightning.

J. LEMMING.—You are mistaken. "Elastic gum" is not, as you suppose, gutta percha, but Indian rubber. Gutta percha is *flexible*, but not elastic. Indian rubber is both flexible and elastic. Your proposed experiment, therefore, would prove a failure.

THOMAS KERSHAW wishes to know "what will stop the growth of a young man," and he states that "this is a question which greatly involves his interests!" Really, editors have strange questions put to them. Most young men are anxious to improve their growth. Our correspondent need not fear; certainly, if he can put such questions as this, *he* will never be a *great* man

JAMES CRITCHLEY.—We cannot undertake to give directions as to the most economical way of obtaining loans for the purchase of houses We should think you might borrow £300, on the security you name, in your own neighbourhood.

A. B. C.—We have published "A Manual of the French Language," and are now publishing Lessons in French in the numbers of the "Popular Educator." Either of these you will find "easy and economical" You ask, also, "what they make porter of?" You had better inquire of some porter maker.

S. THOMPSON.—We believe the addre Lovejoy is "Reading, erkshir

H BROWN.—Coarse house-sand is the sand usually employed, with charcoal, in filtering machines.

J B.—A *copyhold* is a tenure under the lord of only; ing to how but the copy of the rolls made by the Lords' court on such tenant being admitted to any parcel of land or tenement belonging to the manor A *freehold* is land held in perpetual right A freehold may be in deed or law. A *freehold in deed* is actual possession of the land; a *freehold in law* is a right to such lands before entry Some copyholds are as good as freeholds.

A SUBSCRIBER.—The English pronunciation is *Mez-zo-tin-to*, the Italian, *Met-zo-tin-to* The former is that most commonly used.

A LABOURING MAN.—A History of America will, no doubt, appear in due course

A YOUTH OF EIGHTEEN.—If you wish to travel with goods for sale, you must take out a hawker's licence, which, if you travel on foot, will cost 4s., if with horse, 8s. You are scarcely eligible for the situation to which you refer.

THOMAS.—The "pancreas" is that flat glandular viscus of the abdomen which in animals is called "the sweetbread."

AMICO.—Your hint respecting etymology and pronunciation will be attended to

SCRAPER.—Many receipts for razor paste are given. The following has been strongly recommended.—Prepared putty powder, one ounce; powdered oxalic acid, a quarter of an ounce; powdered gum, twenty grains. Make this into a stiff paste with water, and spread it evenly and thinly over the strop With very little friction this paste gives a fine edge to the razor. Its efficiency is still further increased by moistening it.

T GROVE.—We are not aware that any person has ever attempted to estimate "the weight of the rock on which the equestrian statue of Peter the Great stands, at Petersburg."

TYRO.—Your question has been answered before. *Horse-power* is the power of a single horse to lift a certain weight in a given time; and this is fixed upon as a standard by which to estimate the power of steam-engines Suppose, for example, one horse is able to lift a weight of 30,000 pounds one foot in every minute, then an engine capable of doing twelve times as much would be called *a twelve horse-power.*

EGYPT; ITS EDIFICES AND ITS PEOPLE.

THE NILE.—THE ISLAND OF PHILAE.—ELEPHANTINE AND ITS RUINS

THE traveller in Egypt will sometimes have a glimpse of that beautiful creature, the gazelle, with its graceful figure and beaming eyes, which has always been a favourite with Oriental poets, from whose writings it has been borrowed by our northern bards. It is the same animal which, under the name of the roe, is frequently alluded to in the Sacred Scriptures.

Nor will he fail to notice the palm-trees which grew in that remarkable country. One of these—the date palm—has its summit crowned with waving leaves, often six or eight feet in length, from which hang the clusters of dates—the fruit so valuable to many oriental people. In Egypt, the large leaves are used as fly-traps, to drive off the numerous flies that there cause much annoyance. Small bunches of the palm leaves also serve, in the houses, to cleanse the sofas and other furniture from dust. The lesser boughs are used for fences and [illegible] the timber of slight buildings, while the web-like integuments that hang among the boughs make excellent ropes. The Doum palm is another variety of this large and diversified class of trees.

Among the remarkable classes of people who are likely to attract the attention of the traveller, is that of the serpent charmers. The reptiles on which they exercise their art are chiefly cobras; perhaps because from their size and the deadliness of their venom, they offer the most surprising and convincing proofs of the charmer's skill. These men are generally of a separate and distinct caste, and arrogate, as might be expected, more credit for their powers than they are really entitled to.

THE SERPENT CHARMER.

"The charmer when he intends to draw forth serpents from their retreats," says Mr. Lane, "assumes an air of mystery, strikes the walls with a short palm-stick, whistles, makes a clucking noise with his tongue, and generally says, 'I adjure you by God, if ye be above, or if ye be below, that ye come forth, I adjure you by the most great name, if ye be obedient, come forth, and if ye be disobedient, die, die, die!' The effect produced on the serpent is, of course, not by the adjuration, but certainly by the knocking, and the whistling, and the clucking sounds, which experience has led the man to know will influence the snake; while the adjuration will have the effect designed on the by-standers."

The banks of the Nile are an unfailing source of interest, though unlike many others, since they have no water-plants, no weeds, or shrubbery, or anything of the kind at the water's edge, or for some distance from the shore. The height of the banks in most places, the scattered palm groves; the fields of grain ripening to the harvest, the villages seen at intervals, and as near the water as they can be placed, because of its all-essential importance; the flocks of sheep and goats; the occasional herds of cattle, now and then camels slowly trudging along; and when the river is getting low, the busy workmen at the shaduf or sakieh, giving note of the industry of the inhabitants—all these are features in an ever-varying scene, which rarely loses its interest or fails to gratify the beholder. But there is one extraordinary spectacle. The magnificent skies of southern Egypt, more glorious, or at least more marvellous, than aught ever seen in colder regions, exhibits stars spark-

ling like suns, while the surface of old Nile seems to glitter as if filled with diamonds.

The island of Philae has peculiar attractions. As its shore is neared, it is impossible not to be struck with the marked contrast of the scenery round about, and of that below the rapids. Usually, the banks of the Nile are of uniform height, without stones or rocks, save when the mountain range rises abruptly at the water's edge, and the eye sees, day after day, the same plain on either hand, with the villages, towns, and groves of palms, and the vast deserts in the distance beyond; but here, immense rocks not only encompass the river, and divide it into several smaller streams, but spring up in the very midst of the channel, and by their huge masses, and the lofty hills all around, give an air of wildness and almost sublimity to the scene. The island is situated, and not inaptly described as the "pearl of Egypt," which has been given to it, all surprise is lost that the Ptolemys should have chosen this remote and isolated spot for a grand temple, when it is gazed on for awhile, and its admirable position, and its adaptation to the purposes of religious solemnities are observed.

Clambering up a rather steep and high bank, the traveller is brought to the level of the ruined temples, which certainly present a most novel scene, for the whole island is devoted to the vast erections which have here been made, and not a living creature, or a sign of life, can anywhere be beheld. All the glory of Philae has passed away for ever, and its hundreds of priests and priestly attendants, and its crowds of worshippers, from the kings and nobles down to the peasant and the slave, are gone, and the place which once was theirs knows them now no more. Visitors wander through the ruins, and look upon the deserted halls and sanctuaries of pagan idolatry, alone and unattended, save perhaps by one or two little boys who have swam across the channel on a log of wood to salute them with the ever recurring *bakshish!*

The principal building is a temple of the moon-crowned Isis; a stone staircase leads to the top of the temple or second storey. Here may be seen a chamber with a narrow portal, and a number of hieroglyphics and sculptured figures, which, according to Wilkinson, relate to the death and resurrection of Osiris, that deity of whom the Egyptians were as fond as the Greeks and Romans of their Bacchus. Here, too, may be had a fine view of the island itself and the surrounding scenery. A large stone or rock on the edge of the water, opposite the northerly end of Philae, looms up very remarkably, and presents a form not unlike a vast altar or shrine, possibly it may have been used for some religious purposes. To the west appears the island of Biggeh, a wild and desolate spot, where are some few remains of early days, and one or two mud huts built in their midst; and to the south and west are seen the extensive ruins of the Roman station, the narrow channels of the Nile, which flow on either side of the lovely island, and the arid and parched-up plains and hills of Nubia stretching away in the distance.

Passing through the portal the first propylon, there is a large open court, with a fine corridor on either hand, and near the commencement of the eastern corridor is the small chapel of Æsculapius. The sculptures on the propyla are colossal, and though in great measure defaced by the hand of violence, still evince the skill of the artist, and the taste and habits of the age. In the next passage-way, through the second propylon, appears the famous inscription which the army of Napoleon caused to be placed there, and which has not escaped disfigurement; and on emerging into the open space beyond, the travellers stand before the Great Temple, in all its imposing grandeur; while to the south, for a very long distance, appears a continued line of columns, more or less broken, on both sides of the area, terminating in what Irby and Mangles call "a large pylon formed by two moles;" here a lofty obelisk stands, and marks the extreme southerly end of the island. Formerly there were two obelisks, one on each side, at the close of the long colonnade; but at present only one remains, the other having been removed to England by Mr. Bankes many years ago. In this portion of the ruins we behold the evidences of the uses to which the temples, after the fall of paganism, were devoted; for half-standing mud-huts, and great heaps of rubbish from their remains, lie all around, and, if possible, add to the desolateness of the scene. the same thing appears to be true in other parts of Philae, where such proofs of degradation of the living, contrasted with the grandeur of the ancient system of imposture and deception, are exceedingly painful.

At this point, too, is gained another fine view of the country above ancient Syene, and occasionally there is an opportunity to notice the difference between the Nubian race and the Arab population of the Lower Nile. The former are more brave and warlike, and, consequently, possessed of greater liberty than the people of the north. The fellahs of the villages are usually quiet and peaceable, and, having suffered from the hand of despotism being laid heavily upon them, are more degraded and less spirited than the dark-skinned inhabitants of the south. The island appears to be about two thousand feet in length, by perhaps three hundred feet in breadth in its widest portion. Nearly the whole is occupied by temples and buildings, spreading out a noble field for the examination and study of the chronologer and antiquarian.

Without dwelling upon the hieroglyphics or sculptures which abound on the walls and columns of the temples at Philae, attention may be directed to the character of the architecture, so different from that of every other land, and the singular brilliancy and clearness of the colours which have lasted so many centuries, and appear almost as if the work of the past year. In general, there is a heaviness about Egyptian buildings, the vast columns and immense stones which form the walls, the want of relief to a broad and high wall; and the singularly grotesque objects by which the artist sought to divert the attention from dwelling too closely upon the temple as a whole, appear to some as serious defects. Even Sir G. Wilkin on confesses that the architecture of the Ptolemaic period (during which Philae was devoted to the purposes of religious worship) has little to satisfy the mind or gratify the taste, and in speaking of Dendera, acknowledges that the style of the frieze is graceless, the hieroglyphics profuse and ill-adjusted, the columns, looked at singly, heavy, perhaps barbarous, in appearance, and the walls tediously long and unrelieved; and though this language may appear too strong, as applied to Philae, it would perhaps, be generally felt that in these respects Egyptian architecture, as it now appears in ruins, is vastly inferior to that which prevailed in Greece and the west of Europe in later days.

At the same time it is but just to recollect that everything is seen under the greatest possible disadvantage, and, as the learned author of "Modern Egypt and Thebes" very properly says, "a temple did not present the same monotonous appearance (which it now does) when the painted sculptures were in their original state; and it was the necessity of relieving the large expanse of flat wall that led to this rich mode of decoration." But, however this may be, no one can look upon the richness of colouring which still exists, without astonishment; so balmy is the climate of Egypt, so remarkably free from dampness or moisture, and so well suited to the preservation of works of art, that to one who comes from a different climate, it seems well nigh impossible that he can be gazing upon decorations thousands of years old. Over head, he looks upon a ceiling representing the clear blue sky, bespangled with stars, and so fresh and brilliant are the colours, that it needs no particularly vivid fancy to imagine that the scene is veritably before him, and that the artist has not long since left the work which he has completed. On the walls and columns, over the pyla, and throughout the temple, he sees the green, and red, and yellow, and other colours used in adorning the sculptures, and is there too he recognises the same brightness and beauty, and hardly knows whether most to admire these, or mourn over the desolation which the ruins as a whole present.

Over the entrance to the main temple is sculptured that striking symbol, the winged orb. Two or three crosses of St. John, cut into the wall near the doorway, may be observed, and inscriptions in Greek under them, stating the fact that at one period our brethren in the faith of Christ here assembled to worship. This room is about forty feet square, and is adorned with ten noble columns, measuring fourteen feet round, and covered with carvings or sculptures of various sorts, many of which have been

defaced or plastered over as an easier way of hiding them from view. The capitals of the columns are all different in design, and have a singular effect, though it can hardly be considered good taste thus to seek ornament in an edifice of this sort. Doors are on either side, leading into smaller chambers, which once appear to have been elaborately adorned; the light comes from above, there being no windows in the room. Near one of the walls is a splendid block of granite, about five feet in length, which was probably used for an altar when the Christians occupied the apartment as a church.

Various inscriptions are to be found on the walls of the temple, some in Greek, stating how many nobles, warriors, statesmen, and others, came here to worship Isis, and beg her favour and protection; some in Italian, particularly one over the massive doorway to an apartment dedicated to the glory of Pope Gregory XVI. and the renown of the expedition which he sent out in 1841; and some in French, in the days of the older Republic, in which the names of the principal men are recorded with needless particularity, and the victories of the army are sweetened with all the grandiloquence of the Gallic nation. Besides these, the walls and columns, high and low, are disfigured with names of all sorts, and from all climes, perpetrating the memory of Mr Softly's or Mr Simpleton's visit to Philæ. How important is it to the future traveller to know that Mr S has preceded him!

The rapids are no great matter, nevertheless, they are not to be despised, and except under skilful management, a boat would certainly be lost amid the rocks, if it should happen to get among them unawares. Looking from a hill near by at the cataract and its waters dashing down impetuously, several naked Arabs may sometimes be observed prepared to swim down the current, and exhibit their skill in reaching the smoother water below in safety. In they go one or two with a log between their legs, but most of them without anything at all, and at one moment their heads will be above the water, and at another, not a trace of their tawny bodies will be visible. After a few minutes, dripping with the spray, they climb madly up the bank and demand *bakshish* for the sight which has been witnessed. If happily, will take only a few piastres to content them, and to send them off in high glee.

The modern town which answers to ancient Syene, presents few points of interest beyond those which all Arab towns and villages have in common. Syene was a place of importance in earlier days, being on the frontier of Egypt to the south; it is spoken of by the prophet Ezekiel, who denounced the judgments of God against the land of the Pharaohs.

> "Behold, therefore, I am against thee and against thy rivers,
> And I will make the land of Egypt utterly waste and desolate
> From Migdol to Syene, even unto the border of Ethiopia."

In later times, the emperor Hadrian sent Juvenal into banishment to this spot,† with the half-mock title of "Governor of the Frontier of Egypt," and it was here in exile that the great satirist died, four years subsequently, at the advanced age of more than fourscore years. At present, the most interesting objects in connexion with this vicinity are undoubtedly the quarries of granite, so well known under the name of syenite, or red granite. Nothing in Egypt is more calculated to impress the mind strongly with the skill and ability of the ancient inhabitants than what may here be witnessed. What instruments they must have possessed to separate from the solid mass such immense blocks of stone as are seen in every part of Egypt; and what machines they must have used to transport the obelisks, and statues, and sarcophagi to their destinations, often hundreds of miles distant! What is generally stated by writers on antiquities is scarcely credible, that this wonderful people had no tools of iron, but that all their work was postponed with so inferior a metal as copper or brass: if the fact be really so, it heightens the idea of their skill and capacity, and almost puts to shame the greatest efforts of art in modern times. It is a curious thing to see an obelisk nearly completed and wrought with care, lying as it were just ready to be removed; and it does not require much stretch of imagination to suppose that the workmen have only recently left it, and that instead of thousands of years which have passed away never to return, only a few days have elapsed since the skilful artisans of some old Pharaoh were singing merrily over their work.

Another very remarkable locality, up a steep ascent, gives an opportunity to observe the manner in which the ancient Egyptians used to cut off the blocks of stone. Several incisions about six inches deep and wide were made in the rock, at intervals of about ten inches, into these they appear to have driven wooden wedges, which being saturated with water by means of a small trench cut to contain it, expanded, of course, and broke off the block by their equal pressure. In some cases, probably, a violent blow or concussion was employed for the same purpose. "The nature of the rocks about Syene," Wilkinson says, "is not, as might be expected, exclusively syenite, but on the contrary, consists mostly of granite, with some syenite and a little porphyry. The difference between the two is, that syenite is composed of felspar, quartz, and hornblende, instead of mica, or solely of felspar and quartz, and granite of felspar, quartz, and mica. According to some, the ingredients of syenite are quartz, felspar, mica, and hornblende, but the syenite of antiquity, used for statues, was really granite. Indeed, many of the rocks of Syene contain all the four component parts, and from their differing considerably in their proportions, afford a variety of specimens for the collection of a mineralogist."*

Elephantine, the "Isle of Flowers," and according to Herodotus, the dwelling-place of the Ichthyophagi, or fish-eaters, lies opposite Aswân, and in many respects quite equals Philæ in picturesqueness and beauty. M. Denon speaks of it and its ruins in very highly laudatory terms, as indeed, is his practice with nearly everything he saw in Egypt. No doubt the time was, when its temples, with the city of the same name, its quays and public edifices, which, as we are assured, were on the same grand scale as the sacred island of Philæ, were exceedingly imposing and beautiful; but now it would be hard to find a more desolate-looking place than the major part of the island, and the few ruins that are still preserved, hardly repay one for the trouble of a visit, and on the sadness which arises in such a locality, and amid the ruins of such greatness. Here may be seen the scant traces of an ancient Nilometer, the remnants of an ancient quay, a mutilated statue of Osiris, a ruined gateway, and amid the heaps and rubbish of mud huts, and across the hills and fields, a small sarcophagus cut in the solid granite rock, but empty and disused, and without a mark to distinguish its age or owner. Much more attractive seen, the green fields of grain, the stately palms, and the evidences of life, and of God's goodness and mercy, "for He maketh His sun to rise on the evil and on the good, and sendeth rain on the just and on the unjust;"‡ and some will take more pleasure in going through the small village near the river, inhabited by Nubians, and catching a glimpse of their mode of life, than in all the remains of early grandeur which Elephantine presents to the admiring gaze of the traveller.

These poor people, dwelling in their mud huts, which would hardly be thought fit residences for the swine in our country, appear for from unhappy. Their wants are few and easily supplied, their climate, at some seasons, is delicious, their bountiful palms and other trees afford them shade from the scorching sun, and their huts, mean and contemptible as they are, according to our notions, serve to accommodate them and their numerous offspring in a style quite equal to their desires. But what is to be mourned over is their deep degradation in an intellectual and religious point of view. Nine out of ten know literally nothing more than the animals which they employ in cultivating the ground; and not one in a thousand ever attains to even the simplest rudiments of education: and then, when looked at as responsible creatures, as living souls, and as beings who will have to give account for the deeds done in the flesh, whether they be good or whether they

† Ezek. xxix. 10—xxx. 6 marg. reading.
‡ Some authorities mention other localities in Egypt as the place of his exile.

* Handbook for Egypt, page 117.

intended to remedy these disadvantages. It not only indicates the direction of the wind at any convenient distance from the vane, but registers every change. The grand agent in operations of this kind is hydro-electricity. The action of this agent is different in the phenomena it exhibits from that of dry electricity, as shown by the ordinary electrical machine; for, whilst the latter exhibits its most remarkable properties by accumulation, even at rest, as in the charged jar, the electricity of the galvanic battery is scarcely perceptible, unless that which is called "the circuit" is complete. When the poles of the galvanic battery are connected by a continuous metal wire or other conducting substance—water, for instance—then, considering the battery as a conductor, the battery is said to be completed. The conducting circuit may be of any form, according to circumstances, the battery excited during the time the battery is in action moving through it. Thus, in the anemometer before us (from the Greek *anemos*, the wind, and *metron*, a measure)—being provided with four electro magnets, each encircled with fifty feet of copper wire, and the galvanic circle being completed by quicksilver—the eight different points of the wind may be discovered at any time. By the same instrument the direction of the wind is hourly recorded. We will endeavour to explain *how*. The invention consists of—firstly, a registering apparatus; secondly, a vane; thirdly, a clock; and lastly, a galvanic circuit. The registering apparatus (figs. 1 and 2) consists of a system of four electro-magnets *n e s w*, which are connected by thin plates *f f f f* with the four brass columns *a a a a*, and can be adjusted by means of screws. These connexions are provided at the opposite ends with screws *b b b b*. Two cylinders of wood *l* and *m* turn on their axles in the brass sides E E. The cylinder *l* is situated immediately below the plates *f f*. The cylinder M is below the cylinder *l*, and is provided at its end with a catch-wheel *q*. A lever *k h*, bent twice at right angles, has its points of support in two conical sockets H, which receive two screws through the brass side. The longest arm of this lever lies immediately below the plates *b f*, and is provided with the catch *a' k'*, which stops the wheel *q* by means of the spring N. A long strip of paper is wound round the under-cylinder L, and is weighted at the free end, so as to be unrolled as soon as the catch is displaced. In the brass plate D are three screws, in the opposite side are four others *n e s w*.

The vane (figs. 3 and 4) consists of the tin vane A, which turns round the staff B. A small counterweight *p* balances it. Below the vane is a small round plate of ivory C, fastened to the staff by the screw R, in which are four brass sections, *n e s w*, each section being isolated by a narrow piece of ivory. A piece of metal *q*, which is fastened to the balanced end of the vane, and from the chord of an arc of 15 deg., passes gently over one of *w*, as the case may be, of the four sections. The four screws *n e s w* are connected with the sections.

The clockwork I, in figs. 5 and 6, completes the circle, which is broken between *x* and *y*. In the exhibited model quicksilver was used, as the mechanism was not of sufficient strength to form the connexion through a fusible metal.

In figures 7 and 8, *z k* is the galvanic power. The wire from one pole—for instance *k*—is carried through the clockwork to one of the screws *a*, and here divides into four branches *n e s w*. Each branch is coiled round one of the electro-magnets, and then proceeds to one of the four screws *a* (*a e s w*) *a*. Here they are twisted together, each being coated with gutta percha, and are led directly to the vane, where they end in the four sectional screws *n e s w*. The wire from the opposite pole enters the ground, and is connected by a wire with the vane. If, as an example, the vane points to *n*, the index at the balanced end immediately sweeps round to section *n*, and the current would take the following direction, as soon as the clock completed the communication:—It would pass through the wire connected with the section *n* to the electro-magnet *n* through *a*, and from thence round through the remainder of the circle. However, during the moment in which the clock completes the communication, the electro-magnet *n* becomes active, the metal hasp *n* dots the paper by means of the pointed screw *a*, which indicates a wind from the direction *n*; at the same time, the catch is raised, and the wheel *q* turns round the distance of one tooth, and the paper is unrolled for the same distance. If the vane indicates an intermediate distance, as S I, the indication sweeps across the sections *e* and *e*, at the same time, the current flows through the two branches S and L round the electro-magnets *s* and *z*, which mark *s* and *z* respectively in the manner already described.

The clock is also useful as a timepiece. To protect the four sections, the ivory circle can be covered by a tin hood fastened to the vane.

If the apparatus is only used for observations, and not for registering, the electro-magnets may be replaced by four multiplicators, with their indicators, which, when the circuit is completed, indicate the direction of the wind by the deflection of one or more needles. In this case a copper and a zinc plate, placed in damp earth at no great distance, are sufficient.

The inventor has succeeded in doing away with one electro-magnet and one wire in this invention. The wire divides into three branches, and surrounds three electro-magnets, and then connects itself with three points on the ivory circle, as in fig. 9. The ivory bears three concentric rings of metal *a b c*, which are partly sunk below the surface. The grooves are filled with an insulating substance. Each circle is connected with one of the screws, and by that means with one of the three wires. The point of the vane traverses in these circles with three cross pieces of three radii, so that in particular directions of the wind the circle is completed either not at all, or through one or two or three branches, so that either none of the electro-magnets, or the multiplicators a, b, c, ab, ac, bc, or abc, are made active. The signs o, a, b, c, ab, ac, bc, abc, indicate the different directions of the wind. As the number of combinations is in all cases together = 2^n-1, with *n* multiplicators 2^n-1 signs can be given. Therefore, if the direction of the wind is taken into consideration, in which the circle is not completed, 2^n directions may be observed with *n* multiplicators; for instance, with four multiplicators, *a b c d*, the following:—a, a, b, c, b, aa, ac, ad, bc, bd, cd, abc, abd, acd, bcd, abcd.

VISIT TO OLD CHESTER—EATON-HALL.

A LEAF FROM THE NOTE-BOOK OF A TRAVELLER.

THE ancient city of Chester is situated south-west from Liverpool some sixteen miles, upon the river Dee. For its antiquity and memorable associations, no town in England is its equal. Its origin is of very remote date, but no reliable conclusion has as yet settled its exact foundation. In A.D. 61, the Twentieth Roman Legion garrisoned the place, and the walls were built, the same being extended in A.D. 73 by Marius, son of Cymbeline. On the point of its very early settlement, "King" Vale Royal thus discourseth:—"The first name that I find this city to have been supposed to have borne was Neomagus, and thus they derive from Magus, the son of Samothes, who was the first planter of all Britain after Noah's flood which now contains England, and Wales, and of him was called Samothea, and the Samothites was sent to Japhet the third sonne of Noah, and of this Magus, who first built a city over, in this place or thereabouts, it is supposed, the same was called Neomagus. This name I find observed by the learned Sir Thomas Hoult who also affirmeth that Neomagus stood where Chester now standeth." Under the memorable achievements of Julius Agricola, it became a Roman colony, and so continued for two or three centuries. It now contains twenty-seven thousand inhabitants. Amid its quaint old streets, time-battered walls, and ancient cathedral, the stranger finds a large field for contemplation. The walls, built of soft free-stone, are nearly two miles in circumference, and command an extensive and beautiful prospect of the surrounding country, embracing in the distance the hills of Wales.

It was a clear day in September when I visited Chester. A soft, hazy atmosphere threw a dreamy mellowness over the landscape, and, with the winding Dee before, the richly-cultivated meads around, and the grim old peaks in the distance shooting heavenward, the view was charming. I know every one does not recognise the beautiful, or reverence the antique; but I pity the man who can stand upon the embattled memorials of Chester, and enjoy no novelty of feeling or delight. To stand upon, walk upon, and touch the very ramparts of the old Roman Legion! You find yourself transfixed with a silence only equal your dreaming mood.

The walls of Chester are the only perfect specimens of Roman fortification now to be found in the kingdom, and perhaps no sight-seeing in England would impress a stranger more forcibly. Here he stands upon the very work which has stood nearly eighteen hundred years. It is like addressing the dead of cen-

turies, and conversing with them in our own peculiar tongue. This would be the first emotion from which to recover: and "

of a past race, and there, some faint tracery of an almost forgotten nation. O Tempus! "how have the mighty fallen!" The prestige, once a halo encircling the names, Vespasian, Trajan, Constantine, and the Cæsars, has faded into a venerable shadow, so dim, that you go softly for fear of chasing it away! But this is life! Happy the man who can walk with a quiet conscience even amid the humbler avenues of life and at last commune himself calmly for the voyage to those regions from whence no navigator has ever returned. What a port is that!—the hulls and colours of all nations therein, but from which anchorage no piping blast or howling storm shall drift them. May it be ours to shun the reef and gain the port!

Of the many relics discovered in Chester, you have Roman pavements, altars, vases, rings, medals, stones with inscriptions, statues, tiles, and other indications of the dead race. Some thirty years ago, an altar was exhumed—now at Eaton Hall—upon which was this inscription —

NYMPHIS
ET
FONTIBUS.
LEG XX
V V

Pure water springs up on the side of the town where this altar was found, which, no doubt, signalled such a locality.

It is no more surprising than true, that, until recently, no spirit of inquiry or curiosity has been invoked by the inhabitants for these local antiquities of so renowned a nation. So in love are they with gain and self-aggrandisement, that these precious speaking memorials have never been fully appreciated.

The King's School, founded by Henry the Eighth, is a liberal institution. Twenty-four boys, of poor families belonging to the church, are maintained here for four or five years. They must come understanding the rudiments of grammar, and "given to learning," while the course of instruction is such as to qualify the pupils for any of the literary professions or commercial pursuits. There are also the Diocesan and Marquis and Marchioness of Westminster's Schools. The former has about two hundred pupils: the latter (gratuitous for the poor), established by the marquis, is capable of holding eight hundred scholars.

From Chester some three miles south is Eaton Hall, the seat of the Marquis of Westminster. It is considered the best modern specimen of the pointed gothic in the kingdom, comprising a centre and two wings. It is built of light-coloured stone, brought from Delamere Forest, and the designs were furnished by Porden. The building has been undergoing repairs for the past five years, and will not be finished for another twelve months. From this fact I was unable to enter and see its spacious and chastely-decorated rooms, and thus lost the view of the hall, saloon, ante-rooms, dining-room, drawing room, library, the great staircase, state bed room, and chapel. In front you have a scene eminently beautiful—groves, gardens, the conservatory, mountains of Wales, Peckforton Hills, and Beeston Castle, with the gentle Dee, charming in its windings. I need not say here you have the perfection of English scenery. It is a survey that charms the eye, feasts the soul, and makes the pretensions of man and all his laboured ingenuity sink into insignificance.

The present marquis is of the noble house of Grosvenor, and traces his descent from illustrious Normans. At Eccleston, a pleasant little village two miles from Chester, stands a church of Gothic structure, built by the marquis, one of the best specimens of this order in England.

Eaton Hall is a lovely place, centering in a park three miles square, and, methinks, embraces all a mortal can desire. If you seek pleasantness, it is here; if beauty of God's world, it is here; if quietness, it is here; if splendour, it is here; if abundance, it is here. The effect such places and scenes have upon me is to make me appreciate more and more what the Creator has bestowed, while I am thankful I bear evidences of one living in a free and happy land. My country—God bless her!

WHITE'S HYDRO-CARBON GAS AT DUNKELD.

DUNKELD has taken the lead in introducing the hydro-carbon gas into Perthshire. This romantic city was first lighted up by it on the 23rd ultimo, to the no small delight of its inhabitants. The light is acknowledged to be both pure and splendid—the manufacture simple and easy—and the economy, as compared with the old process, very considerable. The apparatus is as suitable for coals and cannels as for resin, in combination with the gas from water. This water-gas is obtained by allowing a rapid succession of drops, or a small stream of water to fall upon a body of incandescent charcoal. A very large volume of pure water-gas is thus rapidly produced, which, being made to combine with the gas from our richer Scotch cannels, in its nascent state, is found to double and even treble the usual amount got from a given weight of coal, and of such purity that no smoke can be drawn from it. Surely such an invention must prove a general benefit, and can provoke no hostility either from the present owners of gas-works or of coal-miners, the value of whose property it will considerably enhance.

We understand that besides the various towns already lighted up by this system, some of the largest mills and manufacturing establishments in Lancashire and Yorkshire have adopted it, where twenty-four to forty thousand cubic feet per day (in winter) is required for one concern—a consumption equal to that of a good-sized town. Comrie, we learn, will be lighted by it within two or three weeks, and we doubt not with equal success.

This invention is exciting much interest abroad as well as at home. The government of Brazil have contracted for the lighting of the city of Rio Janeiro (exclusively) by this gas for the next 25 years—a city of 250,000 inhabitants—the preparations for which magnificent undertaking are now in full activity—Messrs. Laidlaw and Son, of Glasgow, the well-known extensive gasfitters and iron-founders, having a part of the large contract.

Dr. Franklin, Professor of Chemistry, Owen's College, Manchester, in his published report of this process, as applied to coals and cannels, thus sums up its striking advantages:—

1. It greatly increases the produce in gas from a given weight of coal or cannel, the increase being from 46 to 290 per cent., according to the nature of the material operated upon.

2. It greatly increases the total illuminating power afforded by a given weight of coal, the increase, amounting to from 12 to 108 per cent., being greatest when coals affording highly illuminating

3. It diminishes the quantity of tar formed by converting a portion of it into gases possessing a considerable illuminating power.

4. It enables us profitably to reduce the illuminating power of gases produced from such materials as Boghead and Lesmahago cannels, &c. so as to fit them for burning without smoke and loss of light.

5. In addition to these positive advantages, the use of this process does not incur any additional expense in the working of the apparatus, the wear and tear of retorts, or the purification of the gas, and, beyond a change of retorts, it involves no alterations in the construction of furnaces and apparatus at present employed in gas manufactories conducted on the old system.

UNKINDNESS.

BY CHARLES SWAIN.

Oh! could I learn indifference
From all I hear and see,
Nor think, nor care, for others, more
Than they may care for me!
Why follow thus, with vain regret,
To serve a broken claim,
If others can so soon forget,
Why should not I the same?
Oh! could I learn indifference
From all I hear and see,
Nor think, nor care, for others, more
Than they may care for me!

There is no blight that winter throws,
No frost, however stern,
Like that which chill'd affection knows—
Which hearts, forsaken, learn!
What solace can the world impart
When love's reliance ends?
Oh! there's no winter for the heart
Like that unkindness sends!
Oh! could I learn indifference
From all I hear and see;
Nor think, nor care, for others, more
Than they may care for me!

ON THE MANUFACTURE OF PRESERVED FOOD.

As public attention has of late been directed to the use of preserved food in the navy, we take the opportunity of placing before our readers some certain information on this subject

In the "good old times," if a vessel was sent to any distant part of the globe, it was not uncommon for half of her crew to be lost in the passage from the scurvy, and a large portion of the survivors so enfeebled by the disease as to be rendered unfit for service. When Anson set forth on his voyage of discovery, out of 400 men on board the Centurion, 200 died before the vessel reached the island of Juan Fernandez, and of the survivors only eight men were able to do their duty. The naval hospital at Haslar was always crowded with scorbutic patients, and so fatal was this disease, that in one year, out of 12,000 patients no fewer than 9,000 died.

The attention of the most eminent physicians of the day was directed to this appalling scourge, with the view of ascertaining its cause, and applying not only a remedy for the disease, but if possible, a means of prevention. It was satisfactorily shown that the want of vegetable food and the continued use of salted provisions was the cause: that the drinking of lemon-juice and the more frequent use of fresh provisions formed the surest preventives of this afflicting disease It next became desirable to ascertain in what way these preventive measures could best be carried out in practice As regards lemon juice, its concentration in the form of citric acid at once presented a most portable and effective form for its conveyance, and every ship was directed to be furnished with a proper supply of that article.

THE BUTCHER'S SHOP.

THE KITCHEN.—MESSRS. RITCHIL AND M'CALL'S PROCESS.

As regards fresh provisions, many difficulties arose. The crew of a man of war, 300 or 1,000 strong, required whole flocks and herds of cattle to supply them with fresh meat, and where were these, and all the food necessary for their use, to be stowed away? About the year 1811, stimulated by the rewards offered by Napoleon, M. Appert devised a method of preserving animal and vegetable food, differing entirely from that previously adopted, and which consisted in enclosing partially cooked food in vessels either of glass or other material impervious to the air,

the bottles being filled as full as possible, and then hermetically sealed, after which they were exposed for some time to an elevated temperature, by being placed in boiling water. The object sought to be obtained were the exclusion of air and the fixation of the albumen of the meat as to render it incapable of being acted upon or decomposed by any minute quantity of air which might have remained behind.

It may be as well here to state that the decomposition which meat undergoes, and which renders it unfit for use, arises from the action of the oxygen of the air, in union with moisture, on the albumen or jelly constituent of the meat. If, therefore, we wish to keep meat sound and fit for food, we must use such means as will prevent the action of the oxygen of the air on the albumen before mentioned. Now the albumen may be rendered insoluble in moisture or water, or the moisture may be all abstracted from the meat, or the oxygen or air may be prevented coming into contact with the meat. In either of these cases, no decomposition takes place, and the meat remains sound and wholesome. Thus, in smoking or curing hams, we expose them if we apply any process, such as that of Appert's before-mentioned, by which means we can keep the meat out of all contact with the air, we also in this, as well as in the above-mentioned processes of drying and salting, keep it sound and fit for use. Independently of the injurious effects arising from the long-continued use of salt meats, another objection always attaches to it—viz., that in the process of salting, some of the most nutritious properties of the meat, such as the *kreatin* and *kreatinin*, which constitute the basis of muscular strength and power, and which should on no account be removed from the food we eat, are nearly, if not wholly, lost.

(*Continued in page 60.*)

THE PLOUGHROOM.

THE ARABIAN ASTROLOGER.

A MOORISH LEGEND.

MANY hundred years ago, say the old Moorish chronicles, long before Mohammed Aben Alhamar founded his kingdom, an Arab king, named Aben Habuz, reigned in Granada. In his youthful days he had led a life of constant foray and depredation, but now that he was old, he wished to end his days at peace with the world, and in quiet possession of what he had wrested from his neighbours. These commendable intentions of the pacific Aben Habuz, however, were sadly frustrated by certain neighbouring princes who were disposed to call him to account for the scores which he had run up with their fathers. Certain districts of his own territories, also, which during the days of his vigour he had treated with a high hand, were prone, now that he languished for repose, to rise in rebellion, and threatened to invest him in his capital. Thus he had foes on every side, and as Granada is surrounded by wild and craggy mountains, which hide the approach of an enemy, the unfortunate Aben Habuz was kept in a constant state of vigilance and alarm, not knowing in what quarter hostilities might break out.

While he was harassed by these perplexities and molestations, an ancient Arabian physician arrived at the court of Granada. His grey beard descended to his girdle, and he had every mark of extreme age, yet he had travelled almost the whole way from Egypt on foot, with no other aid than a staff marked with hieroglyphics. His fame had preceded him. His name was Ibrahim Ebn Abu Ajeeb; he was said to have lived since the days of Mohammed, and to be the son of Abu Ajeeb, the last of the companions of the prophet. When a child, he had followed the conquering army of Amru into Egypt, where he had remained many years studying the dark sciences, and particularly magic, amongst the Egyptian priests.

This wonderful old man was gladly received, and honourably entertained, by the perplexed Aben Habuz. He would have assigned him an apartment in his palace, but the astrologer preferred a cave in the side of the hill which rises above the city of Granada, being the same on which the Alhambra has since been built. He caused the cave to be enlarged, so as to form a spacious and lofty hall, with a circular hole at the top, through which he could see the heavens and behold the stars, even at mid-day. The walls of this hall he covered with Egyptian hieroglyphics, with cabalistic symbols, and with the figures of the stars in their signs. The sage Ibrahim soon became the bosom counsellor of the king, who applied to him for advice in every emergency. On one occasion, when Aben Habuz was inveighing against the injustice of his neighbours, and bewailing the restless vigilance which he had to observe to guard himself against their invasions, the astrologer, when he had finished, remained silent for a moment, and then replied: "Know, O king, that when I was in Egypt, I beheld a great marvel devised by a pagan priest of old. On a mountain, above the city of Borsa, and overlooking the great valley of the Nile, was a figure of a ram, and above it a figure of a cock, both of molten brass, and turning upon a pivot. Whenever the country was threatened with invasion, the ram would turn in the direction of the enemy, and the cock would crow; upon this the inhabitants were apprised of the approaching danger, and enabled to guard against it in time."

"God is great!" exclaimed the pacific Aben Habuz, "what a treasure would be such a ram to keep an eye on these mountains round me, and then such a cock to crow in time of danger! Allah Akbar, how securely I might sleep in my palace with such sentinels on the top!"

The astrologer waited until the ecstacies of the king had subsided, and then continued:

"After the victorious Amru (may he rest in peace!) had finished his conquest of Egypt, I remained among the ancient priests of the land, studying the rites and ceremonies of their idolatrous faith, and seeking to make myself master of the hidden knowledge for which they are renowned. Whilst thus employed, I succeeded in discovering a wondrous book of knowledge, which contained all the secrets of magic and of art. It had been given by Allah himself to Adam after his fall, and was handed down from generation to generation to king Solomon the Wise, and by its aid he built the temple of Jerusalem. Its resting-place, in a chamber of the central pyramid, was made known to me by an ancient priest; thither I penetrated, into the very heart of the pyramid, and found the precious volume lying on the breast of the mummy of the high priest who had aided in rearing that stupendous pile. I seized it with a trembling hand, and groped my way out of the pyramid, leaving the mummy in its dark and silent sepulchre, there to await the final day of resurrection and judgment."

"Son of Abu Ajeeb," exclaimed the wonder-struck Aben Habuz, "thou hast been a great traveller, and hast seen marvellous things; but of what avail to me is the secret of the pyramid, and the volume of knowledge of the wise Solomon?"

"This it is, O king! by the study of that book I am instructed in all magic arts, and can command the assistance of genii to accomplish my plans. The mystery of the talisman of Borsa is familiar to me, and such a talisman—nay, one of greater virtues—can I make."

"O, wise son of Abu Ajeeb," cried Aben Habuz, "better were such a talisman than all the watch-towers on the hills of Granada. Give me such a safeguard, and the riches of my treasury are at thy command."

The astrologer set to work to gratify the wishes of the king. He caused a great tower to be erected upon the top of the royal palace, which stood on the brow of the hill of the Albaycin. In the upper part of it was a circular hall, with windows looking to every point of the compass, and before each window was a table, on which was arranged, as on a chess-board, a mimic army of horse and foot, with the effigy of the prince who ruled in that direction, all carved in wood. On each of these tables was a lance, no bigger than a bodkin, on which were engraved certain Chaldaic characters. This hall was kept constantly closed, by a gate of brass, with a great lock, of which the king kept the key. On the top of the tower was the bronze figure of a Moorish horseman, fixed on a pivot, with a shield on one arm, and his lance in rest.

Soon after the talisman was finished an opportunity occurred for testing its virtues. Tidings were brought one morning by the sentinel appointed to watch the tower, that the face of the bronze horseman was turned towards the mountains of Elvira, and that his lance pointed to the pass of Lope.

"Let the drums and trumpets sound to arms, and all Granada be put on the alert," ordered Aben Habuz.

"Fear not, O king!" said the astrologer; "Dismiss your attendants, and let us proceed alone to the secret hall of the tower."

On reaching the brazen gate, they unlocked it and entered. When they approached the seeming chess-board, the mimic army was seen to be all in motion. The horses pranced, the warriors brandished their weapons, and there was a faint sound as of a distant army on its march.

"Behold, O king," said the son of Abu Ajeeb, "a proof that thy foes are even now in the field. They are advancing through the pass of Lope, and if you would produce a panic and a bloodless retreat, strike these figures with the butt-end of this magic lance; but would you cause deadly feud and carnage, strike with the point."

"Son of Abu Ajeeb," chuckled the exulting Aben Habuz, "I think we will have a little blood!" So saying, he thrust a magic lance into some of the mimic effigies, and belabboured others with the butt end; the former fell as dead upon the board, and the rest, turning pell-mell upon each other, took to fight. The pacific monarch was with difficulty prevented from exterminating his foes. Scouts were despatched to the pass of Lope, and returned with the intelligence that a Christian army had advanced through the heart of the mountains, almost within sight of Granada, where a dissension had broken out amongst them. They had turned their weapons against each other, and, after much slaughter, had retreated over the border. In the first transport of his joy, Aben Habuz offered the aged maker of the talisman whatever he chose to ask for.

"The wants of an old man and a philosopher, O king," he answered, "are few and simple. Grant me but the means of fitting up my cave as a suitable hermitage, and I am content."

"How noble is the moderation of the truly wise!" exclaimed the king, secretly pleased at the cheapness of the recompense. He summoned his treasurer, and bade him advance whatever money the fitting-up of Ibrahim's hermitage might require. The astrologer now gave orders to have the cave still further enlarged, and had ranges of apartments formed in connexion with his astrological hall. These he fitted up in the most magnificent manner, furnish-

ing them with luxurious ottomans and rich divans; "for," said the reasonable Ibrahim, "I am an old man, and can no longer rest my bones on stone couches, and these damp walls want covering." He had baths, too, constructed, and provided with all kinds of perfumes and aromatic oils; "for a bath," said he, "is necessary to restore the suppleness of the frame withered by study, and counteract the stiffness of age." He caused the apartments to be hung with innumerable silver and crystal lamps, which he filled with a fragrant oil, prepared from a receipt discovered by him in the tombs of Egypt.

I am now content," said the sage to the complaining treasurer; "I will shut myself up in my cell, and devote my time to study. I desire nothing more, except a trifling solace to amuse me at the intervals of my mental labour. I would fain have a few dancing women," said the philosopher.

"Dancing women!" echoed the surprised treasurer.

"Dancing women," replied the sage, gravely. "A few will suffice; for I am an old man, and a philosopher, of simple habits, and easily satisfied. Let them, however, be young and fair to look upon; for the sight of youth and beauty is refreshing to old age."

All things have an end, and the desires of the son of Abu Ajeeb were at last satisfied. The talismanic horseman and the mimic chess-men kept Granada from irruptions of the foe, whom the mysterious discomfitures sustained from time to time had rendered less ready to invade the territories of the peaceful Aben Habuz. One day, however, the mystic horseman veered suddenly round, and, lowering his lance, made a dead point toward the mountains of Guadix. The old monarch, tired of prolonged tranquillity, hastened gladly to the tower, but the magic table remained quiet. Puzzled at the circumstance, he despatched a troop of horsemen to scour the mountains. After three days, they returned, bringing with them a Christian damsel, of surpassing beauty, whom they had captured as she slept at noon beside a fountain. No traces of an enemy had been met with. The damsel was brought into the presence of the king, and his old heart grew warm at the sight of such transcendant loveliness.

"Fairest of women," said the enraptured monarch, "who and what art thou?"

"The daughter of one of the Gothic princes who lately ruled over this land. He has been driven into exile, and his daughter is a captive."

The cautious and far-seeing Ibrahim warned the king against being caught by her seductive charms, assuring him that she was the enemy pointed at by the magic warrior, and advising that she should be given up to himself, who had counter-spells that would set her witchcraft at defiance. The sage counsel and disinterested proposal of the philosopher found no favour in the eyes of the enamoured Aben Habuz. The disappointed Ibrahim retired in high dudgeon, and shut himself up in his hermitage, after giving a last warning to the infatuated king. For a time, the dangerous captive held the heart of Aben Habuz in delightful monopoly. He gave himself up to the full sway of his passion, and neglected all the affairs of his kingdom. The Zacatin of Granada was ransacked for the most precious merchandise of the east. Silks, jewels, precious gems, exquisite perfumes—all that Asia and Africa yielded of rich and rare—were lavished upon the obdurate princess. With all his assiduity and munificence, the venerable lover could make no impression on her heart. Whenever he began to plead his passion, she struck a silver lyre which she had when taken captive in the mountains of Guadix. There was a mystic charm in the sound. In an instant the monarch began to nod; he gradually sank into a sleep, from which he awoke wonderfully cooled in the ardour of his passion. Thus baffled, he alternately pleaded and slept, while all Granada groaned at the treasures lavished for a song. An insurrection broke out in the city, but it was speedily suppressed by the royal guards. A recurrence of these disturbances led Aben Habuz to think of retiring from the duties of his royal office to some quiet abode, where he might urge his suit, undisturbed by outward cares. In his perplexity, he sought the offended sage, whom he found still the luxuries of his hermitage, chewing the bitter cud of resentment. Aben Habuz approached him with the appearance of regret at what had happened, and conciliatory speech, made known his wishes. The softened astrologer regarded him for a moment from under his bushy eyebrows, and replied—

"And what wouldst thou give if I could provide thee such a retreat?"

"Thou shouldst name thy own reward, and, as my soul liveth, it should be thine," answered the king.

"Thou hast heard, O king," rejoined the sage, "of the garden of Irem—one of the prodigies of Arabia the Happy?"

"I have heard of that garden; it is regarded in the Koran, even in the chapter entitled 'The Dawn of Day.'"

"Even such a paradise, where the delights of heaven are enjoyed upon earth, can I make thee here, on the mountain above thy city."

"Make me such, O wise son of Abu Ajeeb! and ask any reward, even to the half of my kingdom."

"Alas!" replied the modest Ibrahim, "thou knowest I am an old man, and a philosopher, and easily satisfied. All the reward I ask is the first beast of burden, with its load, that shall enter the magic portal of the garden."

The monarch gladly agreed to so moderate a stipulation, and the astrologer began his work. In three days, by the power of his incantations, the garden and its palaces were complete. Its beauties can be "better imagined than described." All that could please the eye, or gratify the heart, was within it. At a late hour on the evening of the third day, the astrologer approached the king to "report progress," and announce that the earthly paradise was ready for his possession.

"Enough!" cried Aben Habuz, joyfully; "to-morrow, at the first dawn, we will ascend, and take possession."

The happy monarch slept but little that night. The first rays of the sun had scarcely forced their way over the snowy summit of the Sierra Nevada, when Aben Habuz, accompanied by the Gothic princess, on a white palfrey, and a splendid *cortege*, in the midst of which walked the astrologer, ascended the hill of the Albayzin. It was in vain that the eager king sought for the palaces and embowered terraces of the earthly paradise.

"Nothing, O king," explained the sage, "can be seen until you have passed the magic portal, on whose front you perceive the mystic hand and key which guard the entrance."

In silent wonder, Aben Habuz reined in his steed to gaze at the potent talismans, but the palfrey of the princess proceeded, and bore her in at the portal, to the very centre of the barbacan beyond.

"Behold," cried the astrologer, "my promised reward—the first animal, with its burden, that should enter the magic gateway!"

Awakening from his reverie to a consciousness of the trick, the enraged king exclaimed—

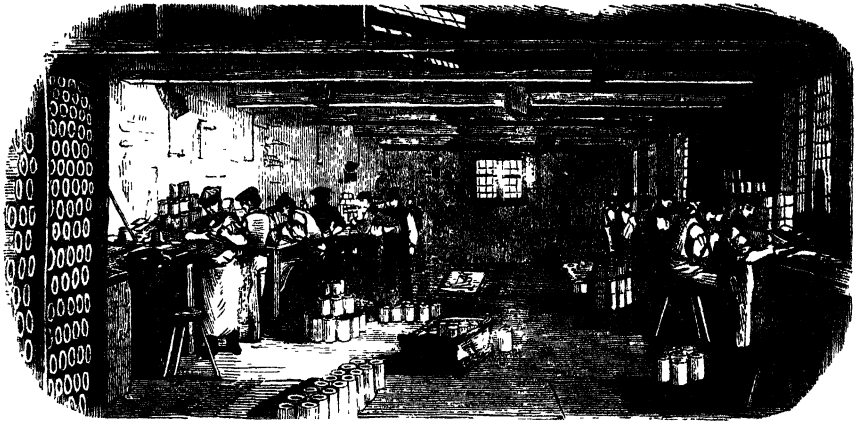
"Base son of the desert! name the richest gem in my treasury, or lead the strongest mule in my stables with the wealth it contains, but presume not to juggle with thy king!"

"My king!" echoed the sage, derisively. "The monarch of a molehill to claim sway over him who possesses the talismans of Solomon! Farewell, Aben Habuz! reign over thy petty kingdom, and revel in thy paradise of fools! For me, I will laugh at thee, in my philosophic retirement."

So saying, he seized the bridle of the palfrey, smote the earth with his staff, and sank with the Gothic princess through the centre of the barbacan. The earth closed over them, and no trace of the opening remained. In vain did a thousand workmen dig. The flinty bosom of the hill resisted their implements, and the sage and his prize were nowhere to be found.

Aben Habuz was in time gathered to his tomb, and, after centuries rolled away, the Alhambra was built on the eventful hill. The spell-bound gateway still remains entire, and now forms the *Puerta de la Justicia* (Gate of Judgment), the grand entrance to the fortress. The old invalid sentinels, who mount guard at the gate in the summer nights, hear the strains of the princess's lyre soothing the love sick astrologer to sleep, and, yielding to their soporific power, doze quietly at their posts. And as the tale circulates around the winter firesides of the Andalusian peasantry, the credulous listeners devoutly cross themselves, and offer up an *Ave Maria* to be preserved from the charms of the Arabian astrologer.

HYDRAULIC MORTAR of a most excellent quality may be made of burnt clay ground to powder, and of pulverised blue lias limemixed in the proportion of 2½ parts of the former to one of the latter. These substances are to be ground together between rollers, after which they are ready for use. This mortar has been employed with great success, for hydraulic works, on the Great Northern Railway.



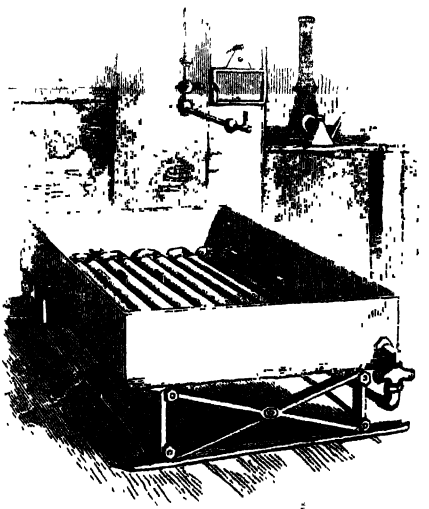
THE MANUFACTURE OF PRESERVED FOOD.

(Continued from page 57.)

It appears, from what we have stated on a former page, that the best process for preserving meat is that of enclosing it in air-tight vessels, and keeping it in this state until required for use.

meat and vegetables are cut up and placed in the tin canisters, which are then filled as full as possible with *bouilli*, or good meat soup. The top of the canister, having a small hole in its centre, is then carefully fixed on by hammering, and securely soldered down; these operations are represented by the engravings in the first column of this page.

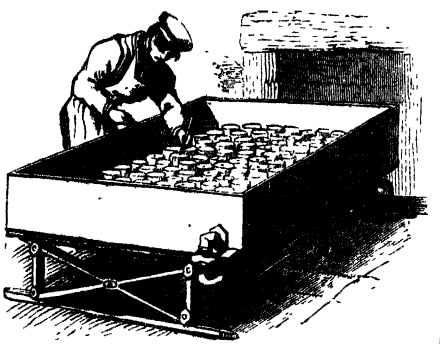
The canisters are next placed on the framework of iron piping which traverses a cast-iron vessel, as represented below.



A CANISTER FACTORY.

Appert's original process has since been greatly modified, and tin canisters are now used in the place of glass bottles. Other contrivances have been introduced with the view of more effectually securing the benefits resulting from this air-excluding process, and although there has been some recent failures in the case of preserved provisions supplied to the navy, yet those failures have arisen, not from unsoundness in the principle but from some neglect or want of due precaution in carrying it out. We believe also that but a small quantity of the preserved provisions supplied were actually injured, but that the introduction

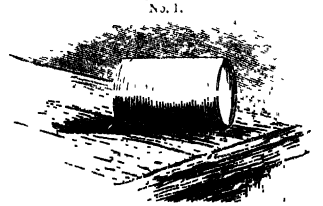
This vessel is then filled to a certain height with a solution of chloride of calcium (called also muriate of lime), and heat applied to raise the temperature of this bath. Solution of chloride of calcium requires a temperature of 230 deg. to make it



of parts of animals unfit for food (a practice to be highly reprobated and severely punished) has been the chief cause of the extensive condemnations of preserved food which have recently been made. We have taken some trouble to investigate the subject, and have been permitted to examine an establishment now in extensive operation, in which we have witnessed the successive processes adopted for the due preservation of animal and vegetable food. We allude to the establishment of Messrs. Ritchie and M'Call, of Houndsditch, whose method of preparing preserved provisions we will proceed briefly to describe.

From the Butcher's Shop we pass to the Kitchen in which the

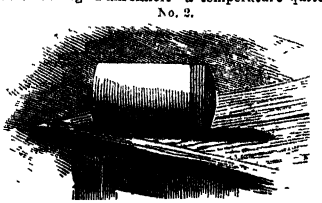
boil; with a bath therefore of this kind the manufacturer is enabled to heat the contents of the canister to the temperature at which they boil (212 deg.), without the solution itself acquiring a boiling temperature, the advantages therefore of the chloride



of calcium baths are, that the requisite boiling temperature is secured to the contents of the canisters, and that too without such an escape of vapour from the surface of the bath, as would interfere with the next operation, that of soldering down the holes which, as before mentioned, are made in the covers of the canisters. As soon as the contents of the canisters are cooked, the hole in the canister is securely soldered. As this soldering process could not be effectively accomplished whilst the current of heated steam is issuing from the hole, the operator first applies a wet sponge to the surface of the cover, which has the effect of instantaneously condensing the steam, and of affording an opportunity for effecting the soldering process. This operation is shown in the accompanying illustration.

SOLDERING UP.

The canisters thus securely soldered, are then allowed to remain a certain time, according to their size, in the chloride of calcium bath, the temperature of which is thus gradually increased here another advantage of the chloride of calcium is shown inasmuch as by its means such a heat may be obtained, as will suffice to insure the complete fixation of the albumen in the food, and thus afford a further safeguard against decomposition



No. 1.

A GOOD CANISTER.

The canisters are now transferred to the proving-room, as shown in the annexed sketch, when they are subjected to a temperature of 90 deg. Fahrenheit—a temperature quite sufficient

No. 2.

A CANISTER.

to develop decomposition, should the contents of the canisters be in such a condition as to supply the required elements thereof

If the canisters pass the ordeal of the proving-room, they are from thence taken to the store-room, where they are painted and labelled for the market.

The illustrations in the other column represent a good and a bad canister In the case of No. 1, it has experienced a slight collapse from the pressure of the external air, whilst No. 2 shows that gases have been engendered within from the decomposition of the food, causing a swelling out of the canister.

In a manufacture of this kind, of course much of the success of the operation depends on the perfect condition of the canister. It is therefore necessary to have these made on the premises, under the constant inspection of the manufacturer himself. The illustrations in the opposite page represent the interior of Messrs. Ritchie and M'Call's canister factory. As we before stated, these canisters are made of tin, or rather tin-plate (iron coated with tin), no other metal having been found to answer the purpose so well.

A GREAT MAN LOST TO THE WORLD.

"AN OWRE TRUE TALE."

MANY years ago—in the summer of the year 1815 it was, or thereabouts—a wealthy merchant of New York took charge of a little boy who had been left an orphan. The parents of this little boy had been actors of some slight celebrity in the theatres of the United States; but dying within a short period of each other, they left behind them, in a state of the completest destitution, three young children. The eldest of these was called Edgar. He was a handsome boy of about six years of age, with a quick eye, an active spirit, and a remarkably intelligent countenance. The merchant of whom we speak had known the parents of the child; and out of pity for its helplessness, he and his wife, who had been blessed with no children, adopted it as their own.

How happily the ardent boy passed his days in the house of his benefactor, how he was beloved by those two childless people; how he became the favourite of a large circle; how, in the strength of their great affection, the merchant and his wife brought him to England, so that nothing might be wanted to make him a gentleman in mind as well as person; how he spent some four or five pleasant years under the care and teaching of a reverend gentleman near London, how he came back again to the city of his birth to finish his education; and how he was generally looked upon as the rich merchant's heir—it would take long to tell. But we would fain linger on this portion of our story, fain dwell upon his precocious wit and aptness for learning; fain make much of his feats of strength and agility—his ease and grace on horseback, his dexterity in fence, and race, and stream, and his success in all that seemed to promise for him a brilliant future. But the truth must be told, no matter how unwilling the teller. He was sent to the college of Charlottesville, amply provided with money. In those days dissipation among the students of colleges was unhappily but too common, and among the most dissolute and extravagant, the wildest rufflers of the town, the hardest drinkers and the most daring gamblers, there was ever to be found one more wild and desperate than them all—and that one was Edgar, now a good-looking free-hearted young fellow of eighteen. Friends advised with him, and he made fair promises in plenty; tutors remonstrated, and he declared that he would amend and win the highest honours yet; companions tempted and wine allured, and he embraced the filthy syren, and so fell Instead of coming home from the university with honours, he was summarily expelled.

One would think that disgrace so public would have broken his proud spirit—but it did not. Because his benefactor refused to pay the gambling debts he contracted at college, the wilful young man wrote him a violent and abusive letter, quitted his house, and soon afterwards left his country with the avowed intention of joining the Greeks, who were at that time in the midst of their struggle with the Turks. He never reached his destination, and nothing was known or heard of him for more than a year. At last, however, he was found, and in circumstances which left no doubt as to the manner in which his European experiences had been bought. One morning the American minister at St. Petersburgh was summoned to save a countryman of his own from the penalties incurred through a drunken debauch. He came in time to rescue the prodigal Edgar from a prison; and through his influence he was set at liberty and enabled to return to the United States.

The first to greet him on his landing was his old patron, the merchant, who was now alone in the world, for his wife had died while Edgar was away. But he took the wanderer to his arms,

and led him back to the quiet home he had quitted so ungraciously. The question then arose as to what should be done for the youth; and on his expressing a wish to become a soldier, interest was made with the merchant's friends, and Edgar was entered as a scholar in the military academy at New York. For a little time all went on well; the young cadet was assiduous in his studies, became the favourite of the mess, and was looked upon by the officers and professors as one of their most promising pupils. But alas, and alas! the old habits of dissipation were too strong to be given up all at once. He neglected his duties; he drank to excess; he disobeyed orders; he openly sneered at the regulations of the academy—and, in ten months from his matriculation, he was cashiered.

Disgraced and humiliated, where could the wretched man find refuge but in the home of his adopted father? Thither, then he went, and was again received with open arms. During Edgar's stay at the academy the merchant had married again to a lady some years younger than himself. Time passed on, but just as the sun of happiness seemed about to shine once more upon him, a quarrel took place between Edgar and the lady, which severed for ever all ties of friendship between the merchant and his adopted son. Another circumstance, which is scarcely fit for mention here, was hinted at, and which, if true, throws a dark shade upon the quarrel and an ugly light upon the character of Edgar. What was the cause, however, the merchant and his adopted son parted in anger, never to meet again! and when the former died, the latter shared no portion of his wealth.

Again thrown upon the world by his own misconduct, the young man tried his hand in a field common to young men, and wrote several poetical pieces and articles in the American magazines. These were so well received that he was almost tempted to believe that he could obtain a living by literature. But his old habits returning, he despaired of success in his new avocation, and enlisted as a private soldier in the United States army. He was soon recognised by a former companion in the military academy, and great interest began to be felt for him among the officers. It was proposed to buy a commission for the talented and humbled young man; but just as friends began to rally round him, and just as their plans seemed about to prosper, he deserted.

For more than two years the world knew nothing of his whereabouts, and, it may be, had almost forgotten him.

In 1833, however, the proprietors of an American magazine offered two prizes for the best poem and tale which should be suitable to their pages. Numerous MSS were sent for competition, and a day was appointed on which the arbitrators should meet to judge of the merits of the various productions. Almost the first manuscript that was opened claimed attention, from the remarkable beauty and distinctness of the hand-writing. One of the arbitrators read a page or two, and was charmed. He called the attention of his friends to the tale, and they were so much pleased with it that it was read aloud from beginning to end, and all admitted that it was worthy the highest prize. The "confidential envelope" was opened—a Latin motto was discovered. No other tales were read, and the award was immediately published. But where to find the author, so that the prize-money might be paid? The publisher and arbitrators had not to wait long. In the evening following the announcement, a young man came to the office to claim the prize. He was pale and thin, even to ghastliness, and his whole appearance bespoke dissipation, want, and illness. A well-worn coat, buttoned up to the chin, concealed the want of a shirt, and imperfect, wretched boots, discovered the absence of stockings. But he looked a gentleman, nevertheless, for his face and hands, though haggard and attenuated, were clean and spotless; his hair was well arranged, his eye was bright with intelligence, and his voice and bearing those of a scholar. The publisher and the arbitrators were interested extremely. They inquired into his history, and finally offered him employment on the magazine for which the tale had been written.

A little money judiciously applied soon altered the appearance of the young man, and in a short time he took his post as second editor of a monthly magazine, with the means and position of a gentleman.

Now here was an opportunity of retrieving his lost character. Here were friends ready not only to overlook the past, but to assist in making his future calm and free from care. Here was a public ready to listen to his teachings, and a patron ready to reward his labours. For a little while all went on well, and those who knew him began to congratulate themselves upon the happy change. Those who before admired his genius were beginning to respect his integrity. He was happy and successful in his new avocation. He married a young and beautiful girl, his cousin; he found for himself a cottage, which the care, economy, and gentle temper of his wife converted into a HOME, and he was beginning to be a happy man. It would be well if our story could end here; but, oh for human frailty! oh for good resolutions made without prayer to God! oh for principles in which He assists not! the young husband of that fair young wife fell back again into evil courses, and forfeited the respect of employers and the sympathy of friends, through his devotion to the accursed bottle!

It were a weary tale to tell how often he repented, and was forgiven, how he passed from the editorship of one magazine to that of another, how he went from state to state and from city to city a hardworking, aspiring, sanguine, talented man, bearing about him the curse of irresolution, never constant but to the "seductive and dangerous beset ment" of strong drink; how friends advised with him, and publishers remonstrated, how at one time he had so far conquered his propensity as to call himself, in a letter to a friend, "a model of temperance and other virtues;" and how, at another, he forfeited the occupation which was the sole dependence of his little family by frequent relapses into his old disgraceful habits; how he committed, under the excitement of intoxication, faults and excesses to which no gentleman would plead guilty; how he borrowed money of his friends without the means or intention of returning it; how he forfeited the esteem, even while his talents commanded the admiration, of the public, how he succeeded in bringing many literary speculations into life which his vicious habits and inattention to business murdered in their youth; how he became confirmed drunkard, with only now and then a fitful hour or so in which to throw off on paper the vagaries of a mind rich in learning and imaginative fancies, how his young wife died broken-hearted, and how he became so reduced as to be able no longer to make an appearance among his friends; how his wife's mother, constant to his failing fortune and even anxious to conceal his vices, went with his MSS from office to office, and from publisher to publisher, in search of the means to support him, how for a little while he shook off the lethargy of intoxication, and again appeared in the polite circles of New York; how he was caressed, and feted, and congratulated; how the efforts of his pen were sought by rival publishers; how he was engaged to be married a second time to a beautiful young woman, and how the engagement was finally broken off through his return to his pernicious habits. It were a weary tale indeed.

The melancholy story of this man's life was soon to close. The golden thread to be rudely snapped asunder—and by his own hand. He had partly recovered from his dangerous courses, and was engaged in delivering lectures in different towns in the United States. They were well attended, and it was with something like renewed confidence that the well-wishers of the lecturer watched his conduct, which was now distinguished by extreme sobriety. He even appeared to have renewed his youth and strength; and it was with pleasure that his friends again received him into their houses. At one of these he met with a lady with whom he had been formerly acquainted. Their friendship was renewed, and they were engaged to be married. Everything seemed to promise well; the dawn of a better day appeared, and reformation so long in coming, seemed to have come at last. But it was not to be. On a sunny afternoon in October, in the year 1849, Edgar set out for New York, to fulfil a literary engagement, and prepare for his marriage. He arrived at Baltimore, where he gave his luggage to a porter, with directions for him to convey it to the railway station. In an hour he would set out for Philadelphia. Well, he would just take a glass before he started—for refreshment's sake, that was all. Oh, fatal hour! In the tavern he met with some old acquaintances, who invited him to join them. In a moment all his good resolutions—home, duty, bride, honour—were forgotten; and, ere the night had well set in, he was in a state of utter intoxication. Insanity ensued; he was carried to a public hospital; and, on the night of Sunday, the 7th of October, he died a raving madman, without a friend or a child beside his pillow. He was only thirty-eight years old when this last dreadful scene of his life-tragedy was enacted.

READER,—What you have read is no fiction. Not a single circumstance here related, not a solitary event here recorded, but happened to EDGAR ALLAN POE, one of the most popular and imaginative writers of America. Comment would be an insult and an impertinence.

EXERCISES FOR INGENUITY.

In resuming a feature hitherto confined to THE SUPPLEMENTARY NUMBER OF THE WORKING MAN'S FRIEND, it is our wish not merely to amuse but also to instruct. Such questions, therefore, as are likely to bring into operation the thinking powers of our correspondents will be freely admitted. The exercises for ingenuity will be continued monthly, and we invite the co-operation of our readers in rendering this department of our work entirely their own. Many of the examples given below have appeared before. Solutions received before May 15th will be acknowledged in Number 34.

1 Plant four trees equally distant from each other every way — John Summers.

2 How many separate words can be derived from the words DEMONSTRATION and GRANDIA

3 Five hundred begins it, five hundred ends it,
Five in the middle is seen,
The first of all figures, the first of all letters,
Take up their stations between
Join all together, and then you will bring
Before you the name of an eminent king

4 The inscription on a guinea ran thus Georgius III Dei Gratia, M B F. ETH. REX. F D B. I T LDSR I A. T. ETE What does it mean in Latin and English?

5 The mean diameter of the earth is 7,900 miles, and the circumference 3 1-7th the diameter If a man were to travel completely round the earth, how many yards would his head go farther than his feet?

6 I'm neither man, fish, beast, or bird,
Insect or reptile none,
Yet live and breathe,—though, on my word,
My origin was bone
As soon as you have found my name
All doubts will disappear,
Then fall not to reveal the same
Unto us without fear
Required a poetical solution

7 A person selling a certain amount of 3½ per cent. stock at 92½, and investing the proceeds in the 2½ per cents., the effect increases his half yearly dividend by 6 per cent. At what price did he purchase the last mentioned stock?

8 Two Arabs sat down to their repast in the desert, one had five loaves, and the other three A stranger coming up, requested to be allowed to eat with them, which request the Arabs agreed to Afterwards, he gave them 8 pieces of money, and went upon his way The owner of the five loaves then took up five pieces of money as his share, and left the three for his friend, but the latter objected to this arrangement, and insisted on having one-half As soon as between them they could agree to the proper division of the money, the stranger was brought before the cadi of the town they arrived at, and this was his judgment "Let he had the five loaves have seven pieces of money, and he who had the three loaves content himself with one." Was this sentence just?

9 A banker discounting a bill for £1,030 for 73 days, by the common method, deducted as a balance more than he would have done had he reckoned the discount by the present worth at 5 per cent. per annum at what rate did his discounting, as compared with the former, result.

10 Curtail and behead a town in France, comprised of letters five

And your mother you will then disclose as sure as yet alive.

11. Mathematicians affirm that of all bodies containing the same superficies, a *sphere* is the most capacious They may not, however, have considered the amazing capaciousness of a body whose name is now required. Of this body it may be truly affirmed that, supposing its greatest length 9 inches, its greatest breadth five inches, and its greatest depth 3 inches, yet under these dimensions it contains a solid foot.

12 There is a certain number which is divided into four parts To the first part you add 2, from the second part you substract 2, the third part you multiply by 2, and the fourth part you divide by 2, and the *sum* of the addition, the *remainder* of the substraction, the *product* of the multiplication, and the *quotient* of the division are all equal and precisely the same. How is this?

13 What is the first money purchase recorded, and what was the object purchased?

14 Why does the sun extinguish a Kitchen fire, and yet not put out the flame of a farthing candle?

15. On being asked how old he was, a gentleman replied —"The square of my age 60 years ago is double my present age." How old was he?

16 The following charade by the late Mr. *Praed*, is given by Miss Mitford in her "Literary Recollections." She acknowledges her inability to discover its meaning can any of our readers assist her?

Sir Hilary charged at Agincourt,
Sooth, 'twas an awful day,
And though in that old age of sport
The ruffians of the camp and court
Had little time to pray,
'Tis said that Sir Hilary muttered there
Two syllables by way of prayer.

My first to all the brave and proud
Who see to-morrow's sun,
My next with her cold and quiet cloud
To those who find their dewy shroud
Before to-day be done.
And both together to all blue eyes
Which ope when a warrior nobly dies.

17 What is the origin of the word stationery?

18 Divide the number 15 into three parts, so that their squares may have equal differences, and the sum of their squares may be 75.

19 The distance between the centres of two wheels, (to turn each other) is 10 inches and the number of teeth in one wheel is 40, and in the other 30 It is required to find their diameters

20 I am a verb Head me with a C and I am *to struggle*, with an *H* and I am the summer of life, with an *M* and I appear full of gloom, with a *P* and I am elevated to the highest pontifical dignity, with an *R* I am indispensable to seamen and builders, begin me with a *T* and call me with an *H* and I represent a character by which no man would care to be known

21 Can any of our readers furnish an arithmetical solution of the following problem, viz. Isaac Newton —If 12 oxen will eat 3½ acres of grass and two cows and 21 calves will eat 10 acres of grass in 9 weeks, how many oxen will eat 21 acres in 18 weeks—*the grass being allowed to grow uniformly.*

22 Before re... inch is too fast, and points to afternoon time, is put b... minutes, and it is observed that the true time before she... true time as 29 is to 105 Required the true time

23 Three pe... ounting about their money Says A to B and C—"If ... as were added to my money I should have as much a... Then replied B, "If eleven sovereigns were add... to I should have twice as much as you both" And then ... leven sovereigns were added to my stock, I should ... times as much as you both" How much had each

MISCELLANEA.

EASE FOR MAN.—By the year two thousand (says an American paper) it is probable that manual labour will have utterly ceased under the sun, and the occupation of the adjective, "hard-fisted," will have gone for ever. They have now in New Hampshire a potato-digging machine, which, drawn by horses down the rows, digs the potatoes, separates them from the dirt, and loads them up into the cart, while the farmer walks alongside, whistling 'Hail Columbia!" with his hands in his pockets

YANKEE WIT.—At Jackson, Dan Russell, the union candidate for auditor of public accounts in Mississippi, was suddenly called upon for a speech by enthusiastic shouts from the audience Rising upon the speaker's stand, he thus commenced — "Fellow-citizens, you have called on me for a few remarks I have none to make I have no prepared speech Indeed, I am no speaker, I only want to be an *auditor*' We need hardly say that the well timed pun brought down the house

PIECEWORK—One very remarkable instance of great earnings, consequent on extraordinary skill, seems worth mentioning The wages of a founder in the metal mills amounted, on one occasion to 22s or 23s. a day, he working by the piece rates of payment less than were allowed to Mr Jellicoe, a great private manufacturer at Gosport Sir Samuel Bentham instituted a full inquiry on the subject, and found that the metal-mill operative had happened that week to have been employed on very difficult brass-castings, that he was expert enough to rarely fail of success, though ordinarily, in other hands, several imperfect castings had to be rejected for every one that was accepted Sir Samuel, of course, sanctioned payment of the full sum set down, and had the satisfaction to feel that government were gainers thereby to a great amount; for much fuel was saved as also that loss of metal always consequent on a re-melting of imperfect castings

HUNTER'S ONLY PUN.—The celebrated John Hunter is said to have made but one pun in his life, and that was when lecturing at the Windmill-street School of Medicine In demonstrating the jaw-bone, he observed that the bone was known to abound in proportion to the want of brains Some students at the time were talking and not attending to the lecture, upon which Hunter exclaimed—"Gentlemen, if you have more *intellect*, and less *jaw*

THE CHARMS OF MIXED CONVERSATION.—Historians tell us that it took seven studious years of an ancient philosopher's life to ascertain why so many women, each a professor of natural loquacity, could converse together, day by day in twos and threes and fours, but especially in twos or the same (to their individual selves) personal subjects—all, of course, talking simultaneously, and none hearing what was said by a co-gossip At last he hit upon the reason Each woman heard but her own remarks, and was consequently delighted with the wit and sprightliness of the conversation This philosopher died full of years and honours He married a dumb lady. There is no such gossip in our day

WOMAN'S SUFFRAGE.—A lady, talking over a lecture advocating woman's voting, the other evening, said, 'Lal what's the use? Is there any womish worth trusting with a vote who can't make two men, at least, vote as she likes?'

A COLUMN OF USEFUL RECEIPTS

PAINTING ON GLASS FOR THE PURPOSE OF MAKING A MAGIC LANTHORN—Take a good clear resin, any quantity, melt it in an iron pot, when melted entirely, let it cool a little, and, before it begins to harden pour oil of turpentine sufficient to keep it liquid when cold In order to paint with it, let it be used with colours ground in oil, such as are commonly sold in colour-shops.

TO ENGRAVE ON GLASS—Cover a plate of glass with a thin coat of wax, surrounded by low edges of the same substance Sketch the figures with a sharp pointed instrument, pour on a quantity of fluoric acid, and expose the whole to the sun's heat The strokes made in the wax will be soon observed

TO WRITE ON GLASS BY THE RAYS OF THE SUN—Dissolve chalk in aquafortis to the consistence of milk and add to it a strong solution of silver Keep this liquor in a glass decanter well stopped Then cut out from a paper the letters you would have appear, and paste the paper upon the decanter, which is then to be placed in the sun in such a manner that the rays may pass through the space cut out of the paper and fall upon the surface of the liquor The part of the glass through which the rays pass will turn black and that under the paper will remain white The bottle is not to be moved during the process

TO GILD WITH GLASS—Letters written on vellum or paper are gilded in three ways in the first a little size is mixed with the ink and the letter when dry is covered with gold size; when it is nearly dry, but not sufficiently so to soil the fingers, the gold is laid on and afterwards burnished The second method is to mix some paper down with size and to form the letters by means of a brush It is supposed that this latter method was that used by the monks in illuminating their missals, initial and rubrics

TO REMOVE GLASS FROM OLD SASHES—Among lamp-glass three pints and one part unslaked lime Let it boil both sides with a stick, and let it remain twenty four hours the putty will then be so softened as to take away easily

TO STAIN GLASS A PRINT TO GLASS—When a little of the engraved print is required to appear on the glass, the glass is first coated with dilute copal varnish and the paper containing the print is dipped in warm water and while the varnish retains a slight tackiness, the paper is placed on the varnish with the print side down and then gently pressed till all the parts adhere. On soon rubbing the paper with the finger moistened with water, the print comes off leaving the ink of the print adhering to the glass The several parts of the print may then be painted with opaque colours on the glass, and finished with a coat of varnish over all

GLASS INDELICATE—Melt pitch, and add thereto a little white lead and bees wax Finely powder and sift hard tallow Mix these ingredients whilst grinding, but a composition for that of a lighter description consists of four pounds of black resin, to which is added half a pound of tallow and white wax; let it be melted to the proper consistency and still warm or shall be applied to the places you would warm it

CEMENT OF BROKEN GLASS—Broken glass may be cemented so as to be as strong as ever by interposing between the parts glue ground up in a mortar, but easier fusion than the pieces to be joined and then exposing them to a heat sufficient to melt the cementing ingredient with which melting the pieces to be united A glass for cementing pieces of broken flint glass may be made by fusing pounded flint glass with pearl ashes, previously reduced to powder, with a little red lead and flax coated with borax only

[The above piece is extracted from a highly-useful, cheap, and clearly-written little book called the "Cupboard Key for the Million" published by Edwin Dipple Stroud, containing upwards of four hundred receipts]

ANSWERS TO CORRESPONDENTS

TENTERDEN,—The 'Handbook on Emigration' is in the press, and will probably be ready by the time you see this

R. COUSINS—We know nothing of the society about which you ask, nor can we undertake to recommend any particular building society.

"YOUR CONSTANT READER"—The house-tax is charged upon all houses worth the annual rent of twenty pounds or upwards If the ground storey be used as a shop or warehouse, the tax is 6d in the pound, if not used for any such purpose, it is 9d in the pound

AN ABSTAINER—You are much below the mark From a return recently obtained by Sir. Joseph Hume, M.P., it appears that the total number of persons in England, Wales, and Scotland, licensed to sell beer or spirits, is 116 142

J. G. (Sheffield) asks—Can a woman legally marry a second husband, her first husband being yet alive, but transported? Certainly not, though, no doubt, some poor females, under such circumstances, would be transported at the idea of being able to do so legally!

HENRI wishes to know if, "when a person dies *intestate*, and the property is in Chancery, how long it must remain there before the right heir can claim it? We suppose he might *claim* it at any time When it would *obtain* it is quite another matter

A TRADESMAN—The exports of British and Irish produce and manufactures have been increasing The annual returns are just printed, and show that, in the twenty-five Midsummer years declared value of such exports was £ 153 , being an increase over the corresponding period of the year 1801 of £61 ,74

GEORGE CLARK—A parliamentary paper recently been printed shows, that on the 20th of November, 1850, there were 1 097, 91 individual depositors in savings banks, whose deposits with interest, amounted to £27 198 63 There were 12 913 charitable institutions depositors savings banks, amounting to £69 , 93 and friendly societies to £1 07 336 The total depositors numbered 1 112 990 and the amount, with interest, £28 930 98 There were, besides friendly societies in the actuaries' returns commissioners of the National Debt, and the amount deposited was £ 77 340.

EDWARD TABRINS—Never heard of Lord St Leonards, the new Lord Chancellor, but he will be the grandson of a well-known London solicitor, who formerly resided on High Holborn the borough of Nottingham Several branches of the family not so entertaining and talented as fortunate, as Sir Edward Sugden, may still be found in the neighbourhood

A SUBSCRIBER—We dare not undertake to say how long it will be before you become a good player on the violin. But if you practise steadily, have a good ear, a good instrument, and the determination to practise, and, at the same time you understand music, as you tell us you state, we think you may safely reckon upon becoming a proficient.

I. STANTON—We must decline interference in your misunderstandings with the Mendicity Society, but you should remember the old adage "Beggars must not be choosers" As to your suggestions respecting farmers planting gooseberry and currant trees, pears and apple trees, in their hedges instead of the present, in order to benefit the poor, we fear that the trees would be generally exposed to what a friend of ours in Kent calls "the beggar blight."

TEETOTALINUS—We cannot insert your letter on the teetotal question, but in answer to a constant reader of the "Working Man's Friend," we must have seen that we refused the total abstinent as one of vital importance to the interests of individuals and the general community

AN ASPIRANT—Your verses will not suit us the sentiments are excellent, but is so poor for versification, we must say, "Try again"

REUBEN SMART—You have written to the publisher of the work as to which you inquire

All Communications are addressed to the Editor, at the Office, 30, Strand, London

NEW SERIES.—VOL. II., NO. 31.] SATURDAY, MAY 1, 1852. [PRICE ONE PENNY.

EGYPT: ITS EDIFICES AND ITS PEOPLE.

THE CITY OF THEBES.

THEBES would be interesting under any circumstances, for it would be difficult to find, anywhere along the banks of the Nile, a more lovely plain spread out to the view, or a more imposing rampart of hills in the distance, to give character and nobleness to the scene, than that on which arose this ancient and far-famed city. On either side of the river, the cultivated land stands back for some two or three miles, not only presenting a rich carpet of green on which the eye loves to rest, but also serving as a magnificent site for the many great and glorious temples that were here exhibited. Often has the traveller attained some elevated position, either among the hills or the massive ruins; and, when compelled to regard the extent not less than the beauty of this plain, which is nearly thirty miles in circumference, he has not known whether more to admire the mighty monuments of the wealth and power of the ancient Egyptians, or their judgment in selecting a scene which would most fitly display their progress in the arts and refinements of life.

Though we use the term Thebes in speaking of the great city which once exercised such wide sway in Egypt, there is no modern town which will answer to this name, but there are several villages, known as Luxor, Karnak, Medînet Habû, &c., which occupy the site of the ancient capital of the Pharaohs. So long ago as the time of Cambyses, the Persian conqueror, B.C. 525, Thebes received a blow to its prosperity, from which it never recovered; for the son of Cyrus spared no efforts to destroy the proud monuments of Egyptian power and glory, and, with a zeal more akin to insane fury than aught else to which it can be likened, he sought to lay in ruins the metropolis of the country which he had conquered. Subsequently, too, one of the Ptolemys, B.C. 116, on occasion of a revolt against his authority, marched against Thebes, and wreaked his vengeance upon it in a manner which it is impossible to characterise in the terms which it deserves; and there can be little doubt, that quite as much of the mischief which has been done to the temples and monuments in and about Thebes, is to be attributed to the deep and insatiable resentment of Ptolemy Lathyrus, as to the hatred manifested by the Persians against a system of worship and religion most odious in their eyes.

LUXOR RESTORED.

Ever since, Thebes has borne but the name of what it once was; it has passed from under the domination of the Roman, the Saracen, the Turk, and the French; and it was for nearly half a century under the iron rule of Mohammed Ali, who, whatever else he may have done for Egypt, did not manifest any very enlightened views in respect to preserving its antiquities from the rapacity of rival collectors or the singular proceedings of certain distinguished savans. Its importance lost, and its glory taken away by the rise of the new capital, Memphis, which, in its turn, has given place to another, where the present Pasha rules supreme, this once mighty capital of a great empire exists no more; but the traveller is compelled to

wander from village to village, and seek in different spots the remains of grandeur which, even in their ruins, strike him more forcibly than he knows how to express. He approaches this deeply interesting region from the north, gliding over the bosom of the same mysterious river, which, for ages, has fertilised and blessed the land of Egypt; he sees before him, on either hand, a plain of several miles in breadth, and some six or eight miles in length, bounded by a line of hills or mountains, which seem, as it were, to inclose this lovely valley with an impassable wall, and render it as secluded as the most devout lover of retirement could desire. In almost every direction, he beholds the evidences of the vast wealth and power of the ancient Egyptians, in the same massive remains of temples, the obelisks, the colossal statues, the avenues of sphinxes, and the towering propyla.

On the west bank he rides over the plain, passes the petty villages, or collections of mud huts, and in an hour's time, finds himself at the top of the mountain range, where he is even more astonished than ever at the wonderful necropolis of ancient Thebes, and spends several days most profitably, in wandering amid, and penetrating into, the tombs of the mighty dead. Here, too, he finds the remains of the Memnonium or Remeseum, the temple-palace of Kúrneh, the great temple at Medínet Habú, the vocal Memnon and its fellow-statue, both the work of Ammoph III, B.C. 1430, and as he surveys the scene immediately before him, with the Nile flowing on ever in its silent majesty, and the vast collection of ruins on the opposite bank, he cannot but admire the grandeur of conception and the extent of resources, which characterise the edifices of this ancient metropolis. Crossing again to the east bank, he sees, almost at the river's side, the ruins of the temple at Luxor, in such strange and offensive connexion with mud huts, stables, pigeon-houses, squalid children, noisy dogs, and such like things, which so effectually destroy all the romance which imagination is apt to invest the relics of bygone ages, be even as the mutilated statues, and the magnificent obelisk whose fellow now graces the Place de la Concorde in Paris; and perhaps he thinks how much more noble and fitting this splendid block of syenite granite appears here, though in the midst of ruins, and exposed to the ignorance of the villagers, no less than the culpable and disgraceful thoughtlessness of some of those who travel, apparently without object, than its companion statue does, in the midst of the gay world of fashion and pleasure

Leaving Luxor, he mounts his donkey, and, riding in a southerly direction about two miles, he arrives at Karnak, where, doubtless, are the most ancient remains of the glory and greatness of Thebes, and where the successive monarchs of old seem to have lavished all their care, and striven each to outdo the other in works which should add to the renown of the metropolis, and carry down their names to the most remote generations. Visiting this last of all, the traveller finds Karnak to surpass all that he could have imagined, and he is for a time bewildered, and lost in the most profound astonishment, as he wanders amid ruins which cover so vast a space, and indicate a previous condition of glory and splendour, far, far beyond all that the world has ever since beheld. He spends some days here in endeavouring to gain a clear idea of what is before him; and leaving it with regret when his allotted time is expired, he is ashamed to acknowledge to himself how little, after all, he has really learned, and how incompetent he is to pretend to speak with precision of what it contains. Most thoroughly, too, does the conviction force itself upon his mind, that, to appreciate Thebes, he must take up his residence here, and, being well prepared by previous study of Egyptian history and antiquities, must give months, where he has had to be content with days, and even hours.

Commencing our examination with the temples and places on the west bank, Belzoni's tomb, unlike most of the others, is entered by a steep staircase, which, according to Wilkinson, descends twenty-four feet in perpendicular depth on a horizontal length of twenty-nine, and certainly seems to mar the effect which is gained by the gradual slope, a descent usually chosen in constructing the tombs. A short distance further on, a second staircase is found, by which a descent is made some twenty-five feet lower, and passing along a passage of about thirty feet in length, an oblong chamber is reached twelve feet by fourteen, where formerly was a deep pit, which Belzoni filled up, and which appeared to form the limit of the tomb, his sagacity, however, and the skill he had acquired in detecting the hidden chambers which were formed with so much care by the ancient Egyptian kings to conceal their mortal remains and protect them from the hand of violence, enabled him, after great labour, to effect an entrance into the secret portions of this truly magnificently adorned burial-place. No wonder that Belzoni was delighted at his success, for rarely does it fall to the lot of man to witness a scene at all comparable with what is here exhibited to the admiring gaze of the visitor. Hall after hall, and chamber after chamber, not more remarkable for size and extent than for beauty of sculpture and elegance of decoration, he open to inspection; and the feelings with which they are beheld by a serious mind are inexpressible.

Belzoni gives an account of the sarcophagus which he found in the vaulted saloon, or grand hall, and which Wilkinson thinks was a cenotaph of the deceased monarch. "The description," he says, "of what we found in the centre of the saloon, merits the most particular attention, not having its equal in the world, and being such as we had no idea could exist. It is a sarcophagus of the finest oriental alabaster, nine feet five inches long, and three feet seven inches wide. The thickness is only two inches, and it is transparent when a light is placed in the inside of it. It is minutely sculptured within and without with several hundred figures, which do not exceed two inches in height, and represent, as I suppose, the whole of the funeral procession and ceremonies relating to the deceased. I cannot give an adequate idea of this beautiful and invaluable piece of antiquity, and can only say that nothing has been brought into Europe from Egypt that can be compared with it. The cover was not there; it had been taken out and broken into several pieces, which we found in digging before the first entrance."* The numerous chambers, filled with hieroglyphics, of which Wilkinson speaks in detail; the freshness of colour; the variety of design; the interest attaching to many of the figures and subjects, particularly those which are said to represent a procession of four different people or races, red, white, black, and white again, four by four, followed by Ra, "the sun,"† the drawings in one of the halls which have never been finished by the sculptor, the various Egyptian divinities; and such like matters, are points respecting which the larger volumes of Wilkinson and others can alone give satisfaction.

Bruce's, or the Harper's tomb—so called from the interesting figures of two minstrels, playing on harps of rather an elegant form, which were copied by the distinguished traveller just named, and furnished to Dr. Burney for his "History of Music"—and also from himself—unlike that of Belzoni, descends gradually from the entrance, and in its whole length of four hundred and five feet, reaches only thirty-one feet below the level of its mouth. Most of the tombs are constructed on this plan, and consist of a straight passage, about twelve feet wide and ten high, cut into the side of the soft limestone rock, and having on each side of the main hall a number of small chambers. The principal interest connected with this tomb, is undoubtedly on account of its throwing light upon the every-day life of the ancient Egyptians; and though the nature of the rock was not very favourable for sculpture, and a large part of the tomb is too much defaced to enable the visitor readily to recognise the design of the artist, still sufficient remains to render Bruce's tomb one of the most attractive of them all. In one of the chambers are represented the various processes connected with culinary operations, as the slaughtering of oxen, the putting the cauldrons over the fire, the kneading of some substance with the feet, the making of bread, where the

* Compare Russell's Ancient and Modern Egypt, p. 223. This sarcophagus has long been in Sir John Soane's museum, in Lincoln's-inn-fields, London

† This is the view advanced by Sir Gardner Wilkinson, who thinks that the four red figures are Egyptians, the white, a nation of the north, the [illegible] people, and the other white figures an eastern tribe, all [illegible] race. Earlier writers, quoted by Dr. Russell, give a different view of these sculptures, supposing that the period referred to is the time of Pharaoh Necho, who conquered Jerusalem and Babylon (see 2 Kings, xxiii. 29, &c.), [illegible] Psammuthis, who made war upon the Ethiopians hence the people understood would be the Jews, Ethiopians, Persians, and Egyptians. The opinion of Wilkinson is, however, entitled to the greater weight, from the fact that no Egyptologer except himself, has devoted the time and attention to Thebes which it deserves.

dough is kneaded by hand, &c. In another chamber is a great variety of warlike instruments, helmets, spears, daggers, clubs, standards, &c. In another are to be seen specimens of household furniture, as chairs, sofas, couches, and numerous ornamental articles for the drawing-room or parlour, of which Wilkinson truly remarks, that they prove that the ancient Egyptians "were greatly advanced in the arts of civilisation, and the comforts of domestic life." One other chamber only demands a passing notice—viz., that from which the tomb generally derives its name. The harpers and their instruments have an additional interest from the circumstance of the name of Bruce being written just over one of them. The .... istrels are blind, and the harps have eleven and thirteen strings; they are performing in the presence of the god Ao or Hercules, and might easily be taken for persons of the same rank in life, and the same occupation, as the wandering musicians of modern days.

The variety in the style, subject, and execution, of the other tombs of the kings is not great, and after all it requires a very extensive preparation to enjoy and profit by most of the objects in which these mansions of the dead abound. The tomb styled by the Romans the Tomb of Memnon, which Wilkinson has described, is certainly well worthy inspection, and appears to have been greatly admired by the Greek and Roma visitors, who have recorded on the walls their sentiments, in inscriptions of some length. Nos. 11 and 15, according to Wilkinson, have several points of interest, illustrative of Egyptian life and manners. The tomb belonging to the priest Petamunap, is very remarkable for its extent, and the profusion of its decoration; and it has been calculated, that the area of the excavation is twenty-two thousand two hundred and seventeen square feet, and with the chambers of the pits, twenty-three thousand eight hundred and nine, and that it occupies nearly an acre and a quarter of ground. The bats often take up their residence in such numbers in this tomb, that it is extremely disagreeable to penetrate into its recesses. In every direction, too, the scandalous manner in which the tombs and mummy-pits have been rifled, and the fragments of human remains scattered about, excite one's indignation at the heartlessness of travellers and antiquarian collectors, and the cupidity of the uncivilised Arabs.

Among the private tombs, by far the most curious and interesting is the one which Wilkinson has marked 35, for "it throws more light upon the manners and customs of the Egyptians than any hitherto discovered." Certainly there could not be a more striking and apt illustration of the words of Moses, than is afforded by the remarkable painting of the brickmakers. "The Egyptians made the children of Israel to serve with rigour; and they made their lives bitter with hard bondage, in mortar and in brick, and in all manner of service in the field: all their service wherein they made them serve was with rigour"—(Exod. i. 13, 14.) Osburn, after stating that this one is the tomb of Rek-sharé, the chief architect of the temples and palaces of Thebes under Pharaoh Moeris, says, "Never, perhaps, has so striking a pictorial comment as this upon the
of t

tense labour that is conveyed by the grouping on the left side of the picture, and, above all, the Egyptian taskmaster, seated with his heavy baton, whose remorseless blows would doubtless visit the least relaxation of the slaves he was driving from their wearisome and toilsome task of making bricks, and spreading them to dry in the burning sun of Egypt, give a vivid impression of the exactitude of the Scripture phrase, 'all their service wherein they made them serve was with rigour.' The inscription at the top of the picture, to the right, reads, 'Captives brought by his majesty' (Moeris), 'to build the temple of the great god.' This means, either that Moeris was the king 'that arose that knew not Joseph, and that reduced the children of Israel to servitude;' or, more probably, that the family or gang of Israelites which are here represented, had been marched up from Goshen, and attached especially to the building of the temples at Thebes."*

Passing by the Memnonium or Remesseum, the small temple to the east, called *Dier el Medineh*, from having been

* Osburn's Antiquities of Egypt, pp. 220, 221.

the abode of the early Christians, and the temple-palace (as it is termed) of Kûrneh, which are not, by any means, unworthy notice, but hardly require attention here, in the midst of so many other imposing ruins in Thebes, it would scarcely be right to omit all mention of the great temple at Medînet Habu, and the Colossus, with which we are familiar under the name of the "Vocal Memnon." The ruins of the temple are easily visited in the course of a day, and strike the attention the more forcibly from their extent, character, and historical associations. "Like all the ruins of Egypt, these are in the midst of surrounding objects which offend the eye and the taste, and afford clear evidence of the degradation of the present race of inhabitants. Heaps of dirt and rubbish, the half thrown down mud huts of the villagers, who usually took up their residence in the midst of the old temples and ruins, and the here-and-there scattered proofs of a miserable existence in the squalid children shouting for bukshish, and the few goats which constitute all the wealth of their parents, give an air of desolation to the scene which can hardly fail to impress the beholder with sad reflections. This temple-palace dates back, according to Wilkinson, to the time of Rameses III., B.C. 1235. Passing what are called lodges, the traveller arrives at a lofty building, resembling a pyramidal tower on either hand, these, together with the oblong court and gateway at the end, and the chambers on the inner or north side, give a good idea of the pavilion of the king, who made his royal residence in a locality such as this. Here, in one of the large courts, as at Philae, it seems not a little curious that no two columns are alike, and that the artist has bestowed more care and labour to make each one different from the other, than to give them all that elegant symmetry and finish which, to our notions, render the Grecian style so attractive.

"The next area," says Wilkinson, "is far more splendid, and may be looked upon as one of the finest which adorn the various temples of Egypt. Its dimensions are about one hundred and twenty-three feet by one hundred and thirty-three, and its height from the pavement to the cornice thirty-nine feet four inches. It is surrounded by an interior peristyle, those east and west sides are supported by five massive columns, the south by a row of eight Osiride pillars, and the north by a similar number, behind which is an elegant corridor of circular columns, whose effect is unequalled by any other in Thebes. Nor do the colours, many of which are still preserved, tend a little to add to the beauty of its columns, of whose massive style some idea may be formed from their circumference of nearly twenty-three feet to a height of twenty-four, or about three diameters." There is something rather grand and very interesting in the sculptures of a historical character on the walls of this vast court, commencing at the inner face of the tower. Despite all the defects of perspective drawing, and the want of proportion in many ways and in many portions of the figures, even the most casual observer must render the tribute of praise to the general effectiveness of the whole, and the singular accuracy and minuteness of most of the details. He cannot well fail, also, being impressed with the temple, as a whole, and as illustrating the main features of Egyptian architecture, in a manner most likely to make a deep and lasting impression. It is quite possible, nay, perhaps probable, that he will feel disposed to condemn these vast edifices, in which the land of the Pharaohs abounds, as heavy and in measure unmeaning, as deficient in the gracefulness and beauty of the Grecian style, and as evidencing a false taste; but he will find them grow upon him, and he will see reason to acknowledge, that in their palmy days, when all the richness of colour, and elegance and profusion of decoration, were brought to bear; and when there was everything in keeping, both in surrounding objects and in the minds of the people, the temples of Egypt must have equalled, if not surpassed, all edifices in the world. Even now, too, the pilgrim wanderer amid the ruins needs no very vivid imagination to

which it took the western world ages to attain.

The position of the Colossi, one of which was known as the Vocal Memnon, is very fine, and doubtless in the days when they were uninjured and surrounded by the magnificence

which characterised Thebes under the Pharaohs, they formed objects of wonder and admiration to all beholders. They are about a mile and a half from the river, which they look towards; they stand in the middle of a broad plain, and not very far from the various ruins recently described. It seems highly probable that these and other colossi formed part of the *dromos* or paved approach to the temple, now no longer existing, on this bank of the Nile. This fact would accord with the name of "Royal Street," which, as Wilkinson states, is mentioned in some papyri found at Thebes, and which led to the river opposite Luxor, with which it communicated by means of a ferry. By the gradual rise of the land, the *dromos* is covered with alluvial deposit to the depth of about seven feet, and of course a large part of the pedestal on which the Colossi stand is below the present surface of the ground; this is to be taken into account in estimating their height and vast proportions.

The height of either Colossus is 47 feet, or 53 above the plain, with the pedestal, which, now buried from 6 feet 10 inches to 7 feet below the surface, completes to its base a total of 60. They measure about 18 feet 3 inches across the shoulders, 16 feet 6 from the top of the shoulder to the elbow, 10 feet 6 from the top of the head to the shoulder; 17 feet 9 from the elbow to the finger's end; and 19 feet 8 from the knee to the plant of the foot. The thrones are ornamented with figures of the god Nilus, who, holding the stalks of two plants peculiar to the river, is engaged in building up a pedestal or table, surmounted by the name of the Egyptian monarch—a symbolic group, indicating his dominion over the upper and lower countries. A line of hieroglyphics extends perpendicularly down the back, from the shoulder to the pedestal, containing the name of the Pharaoh they represent.

"On the lap of the statue," Wilkinson states, "is a stone which, on being struck, emits a metallic sound, that might still be made use of to deceive a visitor who was predisposed to believe its powers." Possibly all this was well studied beforehand by the priests, for the stone of which the Colossi are constructed is, according to the same authority, "a coarse, hard grit-stone, 'spotted,' according to Tzetzes' expression, 'with numerous chalcedonies, and here and there covered with black and red oxide of iron.'" It can hardly be supposed, that they left themselves open to detection by any ordinary means; and if they kept the stone from which the sound was made to issue concealed in the lap of the statue, no ordinary observer could possibly discover by what means the priests rendered the colossus vocal.

The Colossi have little or none of their former beauty and grandeur remaining. Most probably it was the Persian conqueror who broke down and destroyed the upper part of the Vocal Memnon, though Strabo was told that a shock of an earthquake did this damage. Its appearance is now much inferior to that of the other, defaced and mutilated as that is, since the restorer of the upper part, whoever it may have been, has piled up five layers of sandstone, which form the body, head, and upper part of the arms, but have nothing of the finish and workmanship of the rest of the statue. Doubtless it once wore the same semblance of massive elegance, if the term may be allowed, which even now can be detected in the other colossus, where the head-dress is beautifully wrought, and which has its shoulders and back comparatively quite uninjured; but no words can express too strongly their present desolate, disfigured and ruinous condition. Though the name of Memnon is used in connexion with this Colossus, it has really no more to do with that rather doubtful personage than the obelisks at Alexandria have with Cleopatra, by whose name they are commonly called. In reality, these statues were erected by Amunoph III., B.C. 1430, or, according to Osburn, B.C. 1687, who was supposed also to bear the name of Phamenoth; and the title which the vocal statue has attained is owing to a blunder of the Romans, who were noted for their contemptuous treatment of subjects which did not particularly interest them or minister to their national pride. The researches into hieroglyphics since the days of Champollion, have determined with precision to whom the Colossi belong, and as Sir G. Wilkinson declares, "Amunoph once more asserts his claims to the statues he erected."

The ruins of Luxor are of transcendent interest. Passing through the broad spaces between the columns which face toward the river, and admirable in their great size and imposing appearance, even in their present degraded and unworthy position, there is an open space beyond, where was once a large court connected with the other parts of the temple; but now nothing can be more repulsive than the appearance of everything connected with these ruins. Not only are the huts of the fellahs built in and about the temple, but heaps of filth lie in every direction; pigeon-houses are stuck up against the walls; different rooms, filled once with splendid sculpture and elegant decorations, are now used for stables for cattle, and disgust one by the ordure which it is necessary to encounter in order to inspect some interesting point: and beside all, the living objects in the way of men, women and children, are scarcely less repulsive to one's feelings and wishes. These remarks are true of every part of the ruins at Luxor. Mounting upward, now through a fellah's hut, now over the top of habitations into which one can look without difficulty, and now clambering up a narrow stone staircase, half in ruins, the top of the large pyramidal towers which form the grand entrance to the temple, and face northerly in the direction of Karnak, is reached. Perhaps nowhere could one obtain a better position in which to look abroad over the grand plain where Thebes once stood in all her glory, and in which to muse over her fallen greatness, and her majesty even in ruins, than the top of this noble gateway.

The obelisk which stands in front of the propylon just spoken of, at a distance of about thirty feet, is certainly one of the most beautifully executed things which Egypt presents to the admiration of the lovers of art. It is not surpassed by the larger one at Karnak, and it appears in far better preservation than that which now adorns the great Square in Paris. It is of the finest kind of red granite, has received a polish and beauty of finish immitably fine, and rises to a height of about eighty feet, being about seven feet square at the base. Its four sides are covered with a profusion of hieroglyphics, which are "no less admirable for the style of their execution, than for the depth to which they are cut, which in many instances, exceeds two inches." The freshness of colour, and the precision and accuracy of the sculpture, are perfectly astonishing; and did we not know positively, that the obelisk, as well as other grand objects at Thebes, were executed so many ages gone by, we should not deem it possible that any works of art could retain their beauty and elegance for more than three thousand two hundred years.

Directly behind the obelisk and the spot where its companion stood, are two colossal sitting figures of Rameses II., placed on either side of the plyon or gateway; but, like all the statues already noticed, they are greatly mutilated and broken; these are also half-buried in the sand and earth, which has gradually accumulated about them. Though concealed to a considerable extent by the huts of the villagers, and evidently not in their best condition, the battle scenes sculptured on the front of the towers are forcibly illustrative of the skill and taste of the artists so many centuries ago; and, to use the language of Mr. Hamilton, it is impossible "to view and to reflect upon a picture so copious and so detailed, as this I have just described, without fancying that we saw here the original of many of Homer's battles, the portrait of some of the historical narratives of Herodotus, and one of the principal groundworks of the description of Diodorus; and to complete our gratification, we felt that, had the artist been better acquainted with the rules of perspective, the performance might have done credit to the genius of a Michael Angelo, or a Julio Romano. To add to the effect, in front of this wall had been erected a row of colossal figures of granite; fragments of some of them, still there, sufficiently attest their size, their character, and the exquisite polish of the stone."

It is rather an interesting ride from Luxor, in a northerly direction, towards Karnak, through the fields of *halfeh* grass, and passing by the many interesting sites of ancient ruins, the tomb of a noted sheikh, portions of an old wall, &c. As the traveller draws near the temple, he begins to see the evidences of there having been an avenue or street of great size, connecting Luxor with Karnak, even as the former was connected with the temples and palaces on the west bank. Fragments—for they can hardly be called more—of Sphinxes, arranged on either hand, show the direction of the street, and even in their almost shapeless condition, give one something of an idea of the grandeur of the approach to Karnak in former days.

WILLIAM HOGARTH.

SOMEBODY has said that London is deficient in historical memories. Never was there a greater mistake; for its every street is a romance to those who care to read it. About the newer parts of the town we grant that there is little of interest to be told; but in the dark byeways, the old city thoroughfares, and those parts of Westminster which a century since were considered the "west end," the philosophic pedestrian can scarcely wander without coming in contact with numerous incidents of the past. Here the dwelling-place of poet or painter, there the scene of some great tragedy; in one place the site of an old mansion the name of which has become identified with the history of our country, in another the name of a square or street which recalls the exciting events in which the great men of a former generation took active part; the sight of a bit of old wall built into the side of a house brings back the memory to the time when Ethelbert king of Kent founded the first church dedicated to St. Paul; a walk among the ruins of a neglected neighbourhood shows us the spot where Caxton set up the first printing press in England; the removal of a few old houses in the city to make way for a new thoroughfare reveals the crypt of a famous mansion, and gives us a glimpse of the cunning workmanship of our ancestors; and the mere digging of a foundation discovers relics in wood, and stone, and pottery, and precious metal, which tell of a time when the Romans were a potent people among the painted savages of Britain.

And so, whenever we have to say anything of the men who flourished in our past history, we look around, and try if we can discover their whereabouts in London. We speak of Milton, and we remember that he lived in divers strange, unfashionable places; we talk of Nelson, and our thoughts immediately take flight to Piccadilly and St. Paul's, where he lived, and where a nation wept around his tomb; we have but to name the names of Byron, and Scott, and Coleridge, and Southey, and Chatterton, and Bloomfield, and Fielding, and Reynolds, and Lawrence, and Hood, and Pope, and Johnson, and Richard Savage, and a host of others, and a thousand images rise up in our mind of the houses in which some of them were born, in which some of them lived and made merry in jovial companies, and in which others of them died, too early for their fame and the world's good. And the close pent-up church yards where their mortal parts repose, serve but to form a sombre back-ground to our mind's picture. Who shall fill up the gaps in the histories here so feebly hinted at, and say, when the task is done, that London wants historic memories?

Thus, if we come to apply these remarks to the subject of our portrait, we can easily imagine that, to the lover of art, the place where Hogarth was born, the houses in which he lived, and the spot where he was buried, are, as it were, classic ground. Thus, the church of St. Bartholomew, adjoining the market of Smithfield, where he was baptised in 1697; the house in Cranbourne-alley, Leicester-square (now known as the Golden Angel), in which he served his apprenticeship to Ellis Gamble, the engraver; the tavern in Clare-market, called the Bull's Head, in which he was used to meet his brother members of the Artists' Club; the church of St. Paul's, Covent-garden, in which he was married to Jane Thornhill; the auction-rooms under the Piazza, now known as George Robins's, in which he gratuitously exhibited his "Marriage a-la-Mode" to an admiring public; the house in Leicester-square, now the Sabloniere Hotel, in which he lived and died in 1764; and the pretty little churchyard of Chiswick, in which he was buried—come to be cleansed of the dust and soil of every-day associations, and are erected into waymarks in art's history. Thus, ever to the artist mind, do the haunts and homes of genius become—with all reverence be it said—as so many consecrated spots amid the waste places of the earth.

It is not our intention here to attempt anything like a biography of Hogarth. Enough if we jot down one or two of the circumstances by which his life was distinguished; enough if, in brief notices like this, we lead the reader to search out for himself, in more ambitious mediums, the reasons why such and such a man is worthy the remembrance of mankind; enough if we are allowed to lead the way to a study of biography in the most comprehensive sense of the term. "The proper study," says the poets, "of mankind, is man."

The life of William Hogarth, like that of most professional men, is a mere enumeration of the triumphs which he achieved in his art. He was born in a small house in the parish of St. Bartholomew, on the 10th of December, 1697. It appears—what, indeed, is of very small consequence—that his family was originally of great respectability in Westmoreland; but at the time of the artist's birth his father was in rather poor circumstances, being occupied during the day-time as a corrector of the press, and in the evening teaching Latin to a few pupils. Who was the mother of our artist is not known, but that she was of a kind and affectionate disposition appears sufficiently plain from the manner in which her son on more than one occasion spoke of his youth.

From his earliest years Hogarth discovered an aptness for drawing, though of his education we have no certain intelligence. When he became sufficiently celebrated to attract the attention of the public, there were not wanting those who accused him of ignorance even of his native language. His father was poor; but being a scholar, it is not likely that he would have neglected to teach his son. And it must be recollected, too, that much of the bad spelling of which Hogarth is accused has been found on his pictures, where it was probably designedly painted; and that in his day, correct spelling, even among educated men, was not by any means universal.

At about the age of fourteen, Hogarth was apprenticed to Ellis Gamble, an engraver and goldsmith. Whether he had any education or not, he seems to have early discovered that the learning of his father was no protection against sorrow and want; and it is not unlikely that the father made choice of a business for his son which accorded most readily with the means at his disposal. Indeed, the choice may be considered a fortunate one, for it allowed the youthful artist an opportunity of study and practice in design which a more ambitious course might probably have denied him.

[illegible] which is highly characteristic of the genius of the future satirist. Being at Highgate one Sunday with some companions, and the weather being warm and the way dusty, they went into a public-house and called for some refreshment. There happened to be other customers in the house at the time, who to free drinking added fierce talking and some fighting. During the quarrel which ensued, one of them received a blow on his head with a quart pot. The blood running down the man's face gave him such an extremely ludicrous appearance that our young artist could not resist the occasion

So taking out his pencil, he drew such and exact and laughable sketch of the combatants, that on showing it to them they were ashamed of their unseemly quarrel, and shook hands. On other occasions Hogarth seems to have indulged his humour for caricature to an even greater extent; and thus in a little while he gained much celebrity among his companions.

How long he staid with Gamble, or whether he served the full term of his apprenticeship, is not known. Various anecdotes are told of this period of his life, which are more amusing than true;—such, for instance, as his having been seen by Nollekens, the sculptor, carrying his master's sickly baby about Leicester-fields Hogarth, we are told by Allan Cunningham, had at this period ceased to have a master for more than seventeen years, was married to Jane Thornhill, kept his carriage, and was in the full blaze of his reputation when Nollekens was born. So much for biographical accuracy.

From engraving shop bill-heads, shields, crests, supporters, coronets, and cyphers, Hogarth appears to have passed into the employment of the booksellers, for whom he was in the habit of etching vignettes and illustrations. In this way he embellished "Mortrage's Travels" with fourteen cuts, and the "Golden Ass of Apuleius," printed in 1724, with seven more. For the five volumes of "Cassandra," published in 1725, he made frontispieces, in 1726 he illustrated an edition of Butler's "Hudibras"—"a work," says Walpole, "that marked him as a man above the common." But in all these productions there was little of the satiric fire for which his after works became so celebrated; little of the peculiar humour so observable in the better known productions of his pencil, little of the free and happy touch which rendered his pictures so unmistakably original.

From employment like this, the transition to portraits and conversation pieces was easy and natural. He began to find patrons, and was, on more than one occasion, employed by the rich and learned. In 1729, he produced a sketch which made some noise, led the way for future success, and called forth the real strength of his powers. For it must be understood that the best friends of Hogarth claim no higher place for him among the painters than that of a faithful delineator of character; for beauty of finish, or elegance of colour, they—or he make no pretension. It happened that in the year abovenamed, that one Bambridge, warden of the Fleet-prison, and Huggins his predecessor, were accused of breaches of trust, extortions, and cruelties, and were sent to Newgate. On — of their examinations before the House of Commons, Hogarth was present, and made notes of the scene. Of this performance Walpole speaks in the following high terms —"The scene is a committee of the Commons. On the table are the instruments of torture. A prisoner in rags, and half-starved, appears before them, and the poor man has a good countenance, which adds to the interest. On the other side is the inhuman gaoler. It is the very figure which Salvator Rosa would have drawn for Iago in the moment of detection. Villany, fear, and conscience are mixed in yellow and livid upon his countenance; his lips are contracted by tremor; his face advances as eager to lie; his legs step back as thinking to make his escape, one hand is thrust forward into his bosom, and the fingers of the other are catching uncertainly at his button-holes. If this was a portrait, it was the most striking that ever was drawn—if it was not, still finer."

About this time it appears that Hogarth attended Sir James Thornhill's academy. Whether he was a successful pupil or not, does not appear; but that he had studied female character with some success, appears by his winning the heart of his teacher's daughter. On the 2nd of March, 1729, Hogarth, being then in his thirty-second year, married Jane, the only daughter of Sir James Thornhill. It was a stolen match, and of course the knight was mightily offended at our painter's boldness, and refused to be reconciled to the imprudent pair. Soon afterwards, however, Hogarth commenced that famous series of pictures entitled the "Harlot's Progress," and Lady Thornhill being fond of her son-in-law, advised him to lay some scenes of it in the way of Sir James. The advice was taken; and when the knight saw the pictures, and understood whose hand had produced them, he was much pleased. "Tell Hogarth," said he, "that the man who can furnish scenes like these wants no portion with a wife." The quarrel, therefore, between the father and daughter was quickly made up.

The course of Hogarth's life henceforth is but the history of his various paintings. In 1733 the "Harlot's Progress" took the town by storm; and the artist has himself told us what first led him to "turn his thoughts to painting and engraving subjects of a modern kind and moral nature—a field not broken up in any age or country."—

"The reasons which induced me," says Hogarth, "to adopt this mode of designing were that I thought both critics and painters had, in the historical style, quite overlooked that intermediate species of subjects which may be placed between the sublime and the grotesque. I therefore wished to compose pictures on canvas similar to representations on the stage, and further hope that they will be tried by the same test, and criticised by the same criterion. Let it be observed that I mean to speak only of those scenes where the human species are actors; and these, I think, have not often been delineated in a way of which they are worthy and capable. In these compositions, those subjects that will both entertain and inform the mind bid fair to be of the greatest public utility, and must therefore be entitled to rank in the highest class If the execution is difficult, though that is but a secondary merit, the author has a claim to a higher degree of praise. If this be admitted, comedy in painting, as well as in writing, ought to be allotted the first place, as most capable of all these perfections, though the sublime, as it is called, has been opposed to it. Ocular demonstration will carry more conviction to the mind of a sensible man than all he would find in a thousand volumes, and this has been attempted in the prints I have composed. Let the decision be left to any unprejudiced eye, let the figures in either pictures or prints be considered as players, dressed either for the sublime for genteel comedy or farce—for high or low life. I have endeavoured to treat my subjects as a dramatic writer; my picture is my stage, my men and women my players, who, by means of certain actions and gestures, are to exhibit a dumb show."

To this series succeeded several smaller subjects of a similar nature, which met with immense success at the hands of the public. In 1736, Hogarth painted and presented to St. Bartholomew's-hospital two scripture subjects—"The Pool of Bethsaida," and "The Good Samaritan." The "Rake's Progress" followed soon after; and so great was its success that twelve hundred subscribers were obtained for the set of engravings before they had left the artist's hands. "The curtain was now drawn aside," says Walpole, "and his genius stood displayed in its full lustre." From time to time he continued to give these works, which should be immortal, if the nature of his work will allow it. Even the receipts for his subscriptions had wit in them. Many of his plates he engraved himself, and often exchanged faces etched by his assistants, when they had not done justice to his ideas.

About this period he had frequently recourse to the law to protect his copyrights from piracy; for the booksellers' finding his style popular, had no hesitation in copying his engravings in an inferior manner, and selling them at a lower price. In 1745, however, he procured an act of Parliament to be passed, on the principle of literary copyright, which effectually protected his interests.

In the same year appeared his "Marriage a-la-Mode," a series of eight pictures, now in the National Gallery. "The Roast Beef of Old England," "Gin Lane" and "Beer Street." "The Four Stages of Cruelty." France and England," and other less known pictures succeeded each other till almost the moment of his death, which took place at his house in Leicester-square on the 26th of October, 1764.

"It has been observed," says Hazlitt, "that Hogarth's pictures are exceedingly unlike any other representation of the same kind of subjects—that they form a class, and have a character, peculiar to themselves. It may be worth while to consider in what this general distinction consists. In the first place, they are in the strictest sense historical pictures; and if what Fielding says be true, that his novel of Tom Jones ought to be regarded as an epic prose poem, because it contains a regular development of fable, manners, character, and passion, the compositions of Hogarth will, in like manner, be found to have a higher claim to the title of epic pictures than many which have of late arrogated that denomination to themselves. When we say that Hogarth treated his subjects historically, we mean that his works represent the manners and humours of mankind in action, and their characters by varied expression. Everything in his pictures has life and motion in it. Not only does the business of the scene never stand still, but every feature and muscle is put into full play, the exact feeling of the moment is brought out, and carried to its utmost height, and then instantly seized and stamped on the canvas for

ever. The expression is always taken *en passant*, in a state of progress or change, and, as it were, at a salient point. Again, with the rapidity, variety, and scope of history, Hogarth's heads have all the reality and correctness of portraits. He gives the extremes of character and expression, but he gives them with perfect truth and accuracy. His faces go to the very verge of caricature, and yet never we believe (in any single instance) go beyond it. They take the very widest latitude, and yet we always see the links which bind them to nature; they bear all the marks and carry all the conviction of reality with them, as if we had seen the actual faces for the first time, from the precision, consistency, and good sense with which the whole and every part is made out They exhibit the most uncommon features with the most uncommon expressions, but which are yet as familiar and intelligible as possible, because, with all the boldness, they have all the truth of nature. Hogarth has left behind him as many of these memorable faces, in their memorable moments, as perhaps most of us remember in the course of our lives, and has thus doubled the quantity of our observation."

THE TOY OF THE GIANT'S CHILD.

FROM THE GERMAN OF HIS ROYAL HIGHNESS PRINCE ALBERT.

'Mid the lofty Inselberg—a mountain high and strong—
Where once a noble castle stood— [illegible]
Its very ruins now are lost, its site as [illegible]
And if he looks for giants there, they are all dead and gone.

The giant's daughter once came forth, the castle gate before,
And played with all a child's delight before her father's door,
Then sauntering down the precipice, the girl would gladly go,
To see, perchance, how matters went in the little world below

With few and hasty steps she passed the mountain and the wood,
At length approaching near the place where dwelt mankind she stood,
And many a town and village fair, and many a field so green,
Before her wondering eyes appeared, a strange and curious scene

And as she gazed, in wonder lost, on all the scenes around,
She saw a peasant at her feet a-tilling of the ground,
The little creature crawled about so slowly here and there,
And lighted by the morning sun, his plough shone out so fair

"Oh, pretty plaything!" cries the child, "I'll take thee home with me."
Then with her infant hands she spread her kerchief on her knee,
And cradling man, and horse, and plough, so gently on her arm,
She bore them home quite cautiously, afraid to do them harm

She hastes with joyous steps and glad (we know what children are),
And spying soon her father out, she shouted from afar—
"Oh, father! dearest father! what a plaything I have found!
I never saw so fair a one upon our mountain ground!"

Her father sat at table then, and drank his wine so mild,
And smiling with a parent's smile, he asked the happy child—
"What struggling creature hast thou brought so carefully to me
Thou leap'st for very joy, my girl! come, open, let us see!"

She oped her kerchief cautiously, and gladly you may deem,
And showed her eager sire the plough, the peasant, and his team,
And when she'd placed before his sight the new found pretty toy,
She clasped her hands, and screamed aloud, and cried for very joy.

But her father looked quite seriously, and shaking slow his head,
"What hast thou brought me here, my girl?—this is no toy," he said.
"Go, take it to the vale again, and put it down below
The peasant is no plaything, child! how could'st thou think him so?

So go, without a sigh or sob, and do my will," he said
"For know, without the peasant, girl, we none of us had bread,
'Tis from the peasant's hardy stock the race of giants are—
The peasant is no plaything, child—no, God forbid he were!"

MONUMENT TO FENIMORE COOPER.—It was determined, at a meeting which was held in New York during the last month, to erect a statue to the memory of that most original of American writers, Fenimore Cooper. There were present at the meeting Dr Bethune, Mr. Bancroft, Washington Irving, and our countryman, Mr G P R James, besides several gentlemen well known in the United States Letters of adhesion were read from Messrs. Longfellow, Prescott, Hawthorne, and Dana Mr Webster presided, and Mr Bryant read a long and eloquent discourse on the life and writings of the romancist, and the meeting passed off with the greatest enthusiasm

THE CRYSTAL PALACE.

TO THE EDITOR OF THE "WORKING MAN'S FRIEND."

SIR,—Having seen in the public papers a proposition for rendering the Crystal Palace permanently available for the public use by purchase, I beg to suggest, for consideration, the question (not yet mooted that I know of), how far might it be practicable and advisable to form a Joint Stock Company for its purchase, and the carrying out the grand and good designs mentioned in the newspapers?

Do you think one hundred thousand shares of one pound each would not be subscribed for in a week?

That amount per share would give the *masses* of the people an easy means of participating in the proprietorship, and would have a beneficial moral influence upon the industrial classes of the metropolis

The sum of £100,000 would both pay the purchase money of the building, and leave about £[illegible] to be applied to the making it into a winter garden, and the other [illegible] purposes already contemplated

I think there can be no doubt the receipts for admission would be ample as to cover all expense of keeping the property in repair, the payment of a good dividend to the shareholders, salaries of gardeners, clerks, servants, police, insurance, and rent (if any) &c, &c, and to leave a very large surplus [illegible] for the future necessities of so magnificent a work

The surplus would per[illegible] in a little time, purchase the houses, purchaseable, of all the Goths and Vandals, and stupid and selfish grumblers and monopolists, whose natures forbid the desire to benefit mankind

I should be obliged to [illegible] else to consider how far the following estimate, &c, in case this p[illegible] of a Joint Stock Company were acted upon, might be trusted to [illegible]ch a plan seems to me to be free from the objections inseparable f[illegible] that of a few monied men purchasing the building as a mere pers[illegible] lucrative speculation

The fact of fifty thousand artisans London becoming £1 shareholders in the concern, could not fail[illegible]ve a good and lasting effect upon the morals of the people

I am Sir,

Your obedient Servant,

J. [illegible]

Hartlepool, April 25th, 1852

Postscript.—Some time ago I made an estimate of the expense of bringing the Mineral Waters from Bath in pipes underground to the Crystal Palace, from which I conclude that [illegible] number daily for a large draught, or several draughts, of the Spa water would render such a project a payable one, and beneficial to the public health

A PLEA FOR THE BEGGARS.

A FOREIGNER, on being shown about the west-end streets of London, asked, "Where are the beggars?" His polite and well-bred conductor—who for thirty years had never acknowledged to have been eastward of Temple-bar, and who knew nothing of "the City" except as a place where money might be raised on good security—assured him that they were almost unknown in that locality—"The police here, my dear friend, are too many for them," he said, with a half-pitying kind of air, and so dismissed the subject.

And was not the man of St. James's quite right? Do you ever see any number of vagrants about the west-end streets—or rather about the main thoroughfares of Westminster and Pimlico? No, no. If the stranger in London wants to know where to find the beggars, he must not inquire of his wealthy friends, or his fashionable acquaintance; *they* are not likely to give him much information on the subject. He must be content to see the beggars where they are to be found—in the dull back-streets of unfashionable neighbourhoods, about the doors of the minor theatres at night, beside the workhouse walls, in the byeways and unknown parts of the great wilderness called London, in the extreme suburbs, where the hard-working poor make their homes—for the poor appeal to the poor invariably; and seldom appeal in vain.

The beggars of London are a class distinct from those poor persons who have some kind of occupation—lucifer-match selling for instance; and it is to be feared that, in the greater number of instances, mendicity has become a trade rather than a necessity. Indeed in certain districts the same groups of beggars may be recognised day after day, and week after week, till the feelings become hardened, and the pedestrians no longer notice their appeals.

THE DOOR OF THE WORKHOUSE.

Go into High Holborn, the Tottenham Court-road, Newington Causeway, or Whitechapel, if you would see the beggars of London in their every-day guise. Stand just outside the door of a metropolitan workhouse if you would study the character of the suburban vagrant. Look at the group the artist has depicted. There can be no manner of doubt that they are poor and hungry, in rags, and misery, and filth; but it is also patent to the police, and the relieving-officers, and the beadle of the parish, that they have an invincible antipathy to work, and a sort of hereditary love of sunshine and rags. And rags, say some hard-hearted

folk with full stomachs and well-fitting broadcloth, are not really so very unpleasant in warm weather as people might imagine. But only look at the miserable, degraded, starved,

THE HIRED CHILD.

and shoeless wretches, and ask yourselves, oh comfortable moralists! whether it is likely they came into that condition of their own choice. Some grave people, with a genius for statistics, have discovered that every tenth person in London rises from his resting-place in the morning without the means of getting a breakfast. Is it possible that this miserable tithe of the great metropolis *prefer* hunger and cold, or that they remain in the wretched condition in which we see them of their own free will? It is well to be certain that we are quite just before we condemn a whole class for the sins of a few. It may be, and doubtless is, the fact, that, having once fallen into a low, desponding state; having once learned to accept assistance at the hands of the benevolent; having once become inured to the misery of a life in the streets—these outcasts from society no longer feel an inclination to raise themselves in the social scale. Nor can we be surprised to discover that the hard necessity of living should be ignored by a class for whom so little sympathy is shown by the general public. It is so easy to beg, and so difficult to procure employment. Ask any one of the crowd about the workhouse door whether they like the life they lead, and you may be pretty sure of the kind of answer you would get.

Of all the strange sights which London presents to the visitor, no stranger or more appalling one can arrest his attention than this same group about the workhouse-door. The shivering wretches at the pavement-side—even though we admit, for the sake of argument, that they try to look as haggard and miserable as possible—cannot, surely, raise themselves from out the mire of vice and degradation into which they have sunk? It may be—who knows?—that the woman and her children have known the comforts of a better state. We cannot persuade ourselves that even the professional beggars can be much in love with their trade, even though they succeed well enough during the day to make merry over a tripe supper in a St. Giles's cellar at night.

Rags and tatters, and a hired child! How often do we not turn round in the street to gaze upon some mother's face in which the remnants of beauty yet remain—to glance at a little countenance, which might be an angel's, in its look of sweet repose—to feel a minute's pity for their misery, and then pass on.

What matters it even if we give to the undeserving; is it not better that we should bestow our charity upon the worthless, than that any really wanting should be neglected?

A thought like this sometimes comes across the mind of the stranger, and he straightway makes his notions practical. It was a good impulse in him, and it was good to indulge it; but only ask of the policeman at the street-corner, at sight of whom the vagrants have vanished most mysteriously, what he knows of them. The chances are about a thousand to one that he will tell you that the very interesting group—the mother in rags, with a pretty infant in her arms, and the chubby children with such innocent-looking faces and beautiful hair—are the most incorrigible beggars in his beat, "a lot he can't get rid of no-how!"

Well, what are we to do with these kind of people? Are we to allow them to go on starving in our streets—filling our workhouses, to the exclusion of honester folk—defrauding the benevolent of the money which might be better bestowed—sealing up the hearts and closing the purses of those who discover their guilt, as discover it they must sooner or later? These are questions which are easy enough to put, but how difficult to answer! Questions which have puzzled the lawmakers, and magistrates, and keepers of the public streets, these fifty years. "The poor ye have always with you:" how shall we distinguish between the really poor and those who feign poverty for bad ends—between the deserving pau-

THE BEGGAR FAMILY.

pers and the vagrant family of hired children? And how, having separated the one class from the other, shall we dispose of their real or fancied claims? Poverty is the great stumbling-block for political and moral reformers; and the question is, how to remove it.

PORUS TAKEN BY ALEXANDER.

THE artists are often the best annotators of history. In the Great Exhibition of 1851 they made us think, in spite of ourselves, of various passages in our early reading, which we had well nigh forgotten amid the cares of life and the more pressing claims of contemporary events. Thus, in the exquisite silver *alto-relievo* shown in page 76, it was absolutely necessary, before we could properly appreciate its worth, to read up the story which it was meant to tell. But when we *did* take the trouble of remembering the exploits of the Macedonian conqueror—and when we read again the story of Alexander's Indian expedition, laden as he was with spoil and weary with conquest—our appreciation of the artist's labours, and our admiration of the singular fidelity with which the whole story had been worked out, grew more and more It *may* happen that some of our readers have not the book beside them; a few sentences, therefore, may help to make the meaning of the picture plain.

Alexander, the son of Philip of Macedon, after having, in a series of the most extraordinary battles, led the Greeks into the very heart of Persia, and by an invincible heroism and determination, succeeded in triumphing over the ancient enemies of Greece, at last turned his thoughts towards a new field of conquest. With this view he led his troops to anticipate greater glory than they had hitherto shared, and taught them that in the conquest of India lay the crown and triumph of all their enterprises.

Early in the spring of the second year of the hundred and thirteenth Olympiad (B c. 327), Alexander began to make preparations for this remote and dangerous enterprise. Having appointed a general to govern in his absence, he turned his face southward, and in spite of the difficulties which everywhere beset his path—in spite of the rugged nature of the country which he had to pass through with his army—in spite of the opposition of the warlike tribes who harassed his troops at every step of their progress—he fought his way through th obstacles which opposed him, and at last found himself on fertile banks of the river Indus.

On the eastern bank Alexander received the submission of the neighbouring princes. Of these, Taxiles, who was the most considerable, brought, besides other valuable presents, the assistance of seven thousand Indian horse, and surrendered his capital, Taxila, the most wealthy and populous city between the Indus and Hydaspes. But the king, who never allowed himself to be outdone in generosity, restored and augmented the dominions of Taxiles.

The army crossed the Indus about the time of the summer solstice, at which season the Indian rivers are swelled by heavy rains, as well as by the melted snow, which descends in torrents from Paropamisus. Trusting to this circumstance, Porus, a powerful and warlike prince, had encamped on the Shantrou, or Hydaspes, with thirty thousand foot, four thousand horse, three hundred armed chariots, and two hundred elephants. At an inconsiderable distance from the main body, his son commanded a detachment, consisting of the same kind of forces, which were all well accoutred, and excellently disciplined. Alexander perceived the difficulty of passing the Hydaspes in the face of this formidable host, a difficulty which must be greatly increased by the elephants, whose noise, and smell, and aspect, were alike terrible to cavalry. He therefore collected provisions on the opposite bank, and industriously gave out that he purposed to delay passing the river till a more favourable season. This artifice deluded not the Indians; and Porus kept his post. The king next had recourse to a different stratagem. Having posted his cavalry in separate detachments along the river, he commanded them to raise in the night loud shouts of war, and to fill the bank with agitation and tumult, as if they had determined at all hazards to effect their passage. The noise roused the enemy, and Porus conducted his elephants wherever the danger threatened. This scene was repeated several successive nights; during which the barbarians were fatigued and harassed by perpetual alarms. Porus discovering, as he fondly believed, that nothing was intended by this vain noise, but merely to disturb his repose, at length desisted from following the motions of the Macedonian cavalry, and remained quiet in his encampment, having stationed proper guards on the bank.

The false security of Porus enabled Alexander to effect his long meditated purpose. At the distance of about eighteen miles from his camp, and at the principal winding of the Hydaspes, there stood a lofty rock, thickly covered with trees and near to this rock, an island, likewise overrun with wood and uninhabited. Such objects were favourable for concealment: they immediately suggested to Alexander the design of passing the river with a strong detachment, which he resolved to command in person, as he seldom did by others what he could himself perform; and, amidst the variety of operations, always claimed for his own the task of importance or danger The Macedonian phalanx, the new levies from Paropamisus, together with the Indian auxiliaries, and a division of the cavalry, remained under the command Craterus. They had orders to amuse the enemy by making fires in the night, and by preparing openly during day time to cross the Hydaspes. While these operations were carrying on by Craterus, Alexander having collected hides and boats, marched up the country with a choice body of light infantry, the archers and Agrians, the Bactrian, Scythian, and Parthian cavalry, together with a due proportion of heavy-armed troops; the whole a well assorted brigade adapted to every mode of war required by the nature of the ground, the arms or disposition of the enemy. Having receded from the bank to a distance sufficiently remote to exclude the observation of Porus, he advanced towards the rock and island; and in this secure post prepared to embark after taking such precautions against the vicissitudes of war and fortune, as could be suggested only by the most profound military genius. The orders given to Craterus were precise should the Indians perceive, and endeavour to interrupt the passage to the rock and island, he was in that case to hasten over with his cavalry; otherwise not to stir from his post until he observed Porus advancing against Alexander, or flying from the field. At an equal distance between the bank where Alexander meant to pass, and the camp where Craterus lay, Attalus and Meleagar were posted with a powerful body of mercenaries, chiefly consisting of Indian mountaineers, who had been defeated by the Macedonians, and taken into the pay of the conqueror. To provide for any unforeseen accident sentinels were placed along the bank, at convenient distances to observe and repeat signals.

Fortune favoured these judicious dispositions. A violent tempest concealed from the enemy's out-guards the tumult of preparation, the clash of armour and the voice of command being overpowered by the complicated crash of rain and thunder. When the storm somewhat abated, the horse and infantry, in such proportions as both the boats and hides could convey, passed over, unperceived, into the island. Alexander led the line, accompanied in his vessel of thirty oars by Seleucus, Ptolemy, Perdiccas, and Lysimachus; names destined to fill the ancient world, when their renown was no longer repressed by the irresistible diffusion of their master's glory.

The king first reached the opposite bank, in sight of the enemy's out-guards, who hastened, in trepidation, to convey the unwelcome intelligence to Porus. The Macedonians meanwhile formed in order of battle; but before meeting the enemies, they had to struggle with an unforeseen difficulty. The coast on which they landed was the shore of another island, disjoined from the continent by a river commonly fordable, but actually so much swelled by the rains of the preceding night, that the water reached the breasts of the men, and the necks of the horses. Having passed this dangerous stream with his cavalry and targeteers, Alexander advanced with all possible expedition, considering, that should Porus offer battle, these forces would resist till joined by the heavy infantry; but should the Indians be struck with panic at his unexpected passage of the Hydaspes, the light-armed troops would thus arrive in time to attack and pursue the with advantage.

Upon the first alarm given by his out-guards, Porus detached his son to oppose the landing of the enemy with two thousand horse, and one hundred and twenty armed chariots. The forces, arriving too late to defend the bank, were speedily broken and put to flight by the equestrian archers; their leader and four hundred horsemen were slain; most of the chariots were taken; the slime of the river, which rendered the

unserviceable in the action, likewise interrupting their flight.

The sad news of this discomfiture deeply afflicted Porus; but his immediate danger allowed not time for reflection. Craterus visibly prepared to pass the river, and to attack him in front; his flanks were threatened with the shock of the Macedonian horse, elated by recent victory. In this emergency the Indian appears to have acted with equal prudence and firmness. Unable to oppose this complicated assault, he left part of the elephants under a small guard, to frighten, rather than resist, Craterus's cavalry; while, at the head of his whole army, he marched in person to meet the more formidable division of the enemy, commanded by their king. His horse mounted to four, and his foot to thirty thousand, but the part of his strength in which he seemed most to confide, consisted of three hundred armed chariots, and two hundred elephants. With these forces, Porus advanced, until he found a plain sufficiently dry and firm for his chariots to wheel. He then arranged his elephants at intervals of a hundred feet, in these intervals he placed his infantry a little behind the line. By this order of battle, he expected to intimidate the enemy, since their horse, he thought, would be deterred from advancing at sight of the elephants; and their infantry, he imagined, would not venture to attack the Indians in front, while they must be themselves exposed to be attacked in flank, and trampled under foot by those terrible animals. At either extremity of the line, the elephants bore huge wooden towers, filled with armed men. The cavalry formed the wings, covered in front with the armed chariots.

Alexander by this time appeared at the head of the royal short and equestrian archers. Perceiving that the enemy had already prepared for battle, he commanded a halt, until the heavy armed troops should join. This being effected, he allowed them time to rest and recover strength, carefully enforcing them with the cavalry; and meanwhile examined, with his usual diligence, the disposition of the Indians. Upon observing their order of battle, he immediately determined, not to attack them in front, in order to avoid encountering the difficulties which Porus had artfully thrown in his way, and once resolved on an operation, which, with such troops as those whom he commanded, could scarcely fail to prove decisive. By intricate and skilful manœuvres, altogether unintelligible to the Indians, he moved imperceptibly towards their left wing with the flower of his cavalry. The remainder, conducted by Cœnus, stretched towards the right, having orders to wheel at a given distance, that they might attack the Indians in rear, should they wait to receive the shock of Alexander's squadrons. A thousand equestrian archers directed their rapid course towards the same wing, while the Macedonian foot remained firm in their posts, waiting the event of this complicated assault, which appears to have been conducted with the most precise observance of time and distance. The Indian horse, harassed by the equestrian archers, and exposed to the danger of being surrounded, were obliged to form into two divisions, of which one prepared to resist Alexander, and the other faced about to meet Cœnus. But this solution so much disordered their ranks and dejected their courage, that they were totally unable to stand the shock of the Macedonian cavalry, which surpassed them as much in strength, as it excelled them in discipline. The fugitives took refuge, as behind a line of friendly towers, in the intervals that had been left between the elephants. These fierce animals were then conducted against the enemy's horse; which movement was no sooner observed by the infantry, than they seasonably advanced, and galled the assailants with darts and arrows. Wherever the elephants turned the Macedonians opened their ranks, finding it dangerous to resist them with a close and deep phalanx. Meanwhile, the Indian cavalry rallied, and were repelled with greater loss than before. They again sought the same friendly retreat, but their flight was now intercepted, and themselves almost entirely surrounded, by the Macedonian horse; at the same time that the elephants, having lost their riders, enraged at being pent up within a narrow space, and furious, through their wounds, proved more formidable to friends than foes, because the Macedonians, having the advantage of an open ground, could everywhere give vent to their fury.

The battle was decided before the division, under Craterus, had passed the river. But the arrival of these fresh troops rendered the pursuit peculiarly destructive. The unfortunate Porus lost both his sons, all his captains, twenty thousand foot, and three thousand horse. The elephants, spent with fatigue, were slain or taken; even the armed chariots were hacked in pieces, having proved less formidable in reality than appearance, could we believe that little more than three hundred men perished on the side of Alexander. An obvious inconsistency too often appears in the historians of that conqueror. With a view to enhance his merit, they describe and exaggerate the valour and resistance of his enemies; but, in computing the numbers of the slain, they become averse to allow this valour and resistance to have produced any adequate effects.

The Indian king having behaved with great gallantry in the engagement, was the last to leave the field. His flight being retarded by his wounds, he was overtaken by Taxiles, whom Alexander entrusted with the care of seizing him alive. But Porus, perceiving the approach of a man, who was his ancient and inveterate enemy, turned his elephant and prepared to renew the combat. Alexander then despatched to him Meroe, an Indian of distinction, who, he understood, had formerly lived with Porus in habits of friendship. By the entreaties of Meroe, the high-minded prince, spent with thirst and fatigue, was finally persuaded to surrender; and being refreshed with drink and repose, was conducted to the presence of the conqueror. Alexander admired his stature (for he was above seven feet high) and the majesty of his person; but he admired still more his courage and magnanimity. Having asked in what he could oblige him? Porus answered, "By acting like a king." "That," said Alexander with a smile, "I should do for my own sake, but what can I do for yours?" Porus replied, "All my wishes are contained in that one request." None ever admired virtue more than Alexander. Struck with the firmness of Porus, he declared him reinstated on his throne, acknowledged him for his ally and his friend; and having soon afterwards received the submission of the Glausæ, who possessed thirty seven cities on his eastern frontier, the least of which contained five thousand, and many of the greatest above ten thousand inhabitants, he added this populous province to the dominions of his new confederate. Immediately after the battle, he interred the slain, performed the accustomed sacrifices, and exhibited gymnastic and equestrian games on the banks of the Hydaspes. Before leaving that river he founded two cities, Nicæa and Bucephalia; the former was so called, to commemorate the victory gained near the place where it stood; the latter situate on the opposite bank, was named in honour of his horse Bucephalus, who died there, worn out by age and fatigue. A large division of the army remained under the command of Craterus, to build and fortify these new cities.

FABLE TO BE LEARNT BY BEGINNERS.

BY WALTER SAVAGE LANDOR.

THERE lived a diver once, whose boast
Was, that he brought up treasures lost,
However deep beneath the sea
Of glossy hair'd Pachenope.
To try him, people oft threw in
A silver cross or gold zecchin,
Down went the diver "fathoms nine,"
And you might see the metal shine
Between his lips or on his head,
While lazy Tethys lay abed,
And not a Nereid round her heard,
The green pearl-spangled curtain stirr'd.
One day a tempting fiend threw down,
Where whirl'd the waves, a tinsel crown,
And said "O diver, you who dive
Deeper than any man alive,
And see where other folks are blind,
And, what all others miss, can find,
You saw the splendid crown I threw
Into the whirlpool: now can you
Recover it? thus won, you may
Wear it not once, but every day,
So may your sons" Down, down he sprang
A hundred Nereids heard the clang,
And closed him round and held him fast . .
The diver there had dived his last.

THE CAPTURE OF KING PORUS BY ALEXANDER. A BASSO-RELIEVO IN SILVER, WITH 217 FIGURES, EMBOSSED BY HAND, BY J. SZENTPETERI, OF PESTH, IN HUNGARY. EXHIBITED AT THE CRYSTAL PALACE.—(*See page 74.*)

THE ROSICRUCIANS.

"At the dawn of philosophy its dreams were not yet dispersed," says the author of *The Amenities of Literature*, "and philosophers were often in peril of being as imaginative as poets. The arid abstractions of the schoolmen were succeeded by the fanciful visions of the occult philosophers; and both were but preludes to the experimental philosophy of Bacon and Newton, and the metaphysics of Locke. The first illegitimate progeny of science were deemed occult, and even magical; while astronomy was bewildered with astrology, chemistry was running into alchemy, and natural philosophy wantoned in the grotesque chimeras of magical phantoms, the philosophers themselves pursued science in a suspicious secrecy, and were often imagined to know much more than the human faculties can acquire. These anagogical children of reverie, straying beyond 'the visible diurnal sphere,' elevated above humanity, found no boundary which they did not fathom —no altitude on which they did not rest. The credulity of enthusiasts was kept alive by the devices of artful deceivers, and illusion closed in imposture."

These remarks form a fit introduction to a sketch of the remarkable sect of visionary speculators whose name stands at the head of this paper. It is right, at the outset, to admit that their very existence has been denied; but this position has but little authority to support it, in the face of that which proves it to be an historical fact. The influence which this secret fraternity exercised upon opinion during their short career, and the permanent impression which they have left upon European literature, invest their history with a peculiar interest. Wild and visionary though they were, they were not without their uses. Before their time, the superstitions of Europe had been peopled only by the dark and disgusting creations of monkish imaginations; of these the Rosicrucians purged them, and substituted in their stead a race of mild, graceful, and beneficent beings.

This remarkable society, whose doctrines formed so singular a compound of religious mysticism and fanciful romance, though it only became known to the public in the seventeenth century, is said to have originated in Germany three centuries earlier. Their reputed founder, from whom they took their name, was Christian Rosenkreuz, or "Rose-cross," a German nobleman and philosopher, who travelled in the Holy Land, towards the close of the fourteenth century. The story of his life, which is given in a German work, published at Frankfort in 1617, and called *Fama Fraternitatis des loblichen Orden des Rosenkreuzes* (Report of the laudable Fraternity of the Rosicrucians), says, that whilst on his travels, Rosenkreuz fell sick at Damascus, where he was visited by some learned Arabs, who claimed him as their brother in science, and unfolded to him, by inspiration, all the secrets of his past life, both of thought and action. They then restored him to health by means of the philosopher's stone, and afterwards instructed him in all their mysteries. In 1401, he returned to Germany, says the same authority, and drawing a chosen number of friends around him, he initiated them into the mysteries of the new science, having previously bound them by oath to keep it secret for one hundred years. The adepts lived together in a building, which they called *Sancti Spiritus* (sacred spirits), where their founder died, in 1484, at the age of 106 years. The place of his burial was kept a profound secret, and the society renewed itself by the successive admission of new members, in silence and obscurity, according to the last injunction of their master, who directed the following inscription to be placed on a door of their building: "*Post CXX. annos patebo*"—after one hundred and twenty years I will open.

Such is the probably half-mythical account of their origin, which is contained in the work we have mentioned. Many have disputed this remote antiquity, and affirmed that the first dawning of the Rosicrucian doctrine is to be found in the theories of Paracelsus (a German alchemist and physician, who died in 1541), and the dreams of Dr. Dee (a famous English philosopher of the 16th century), who, without intending it, became the actual, though never the recognised, founders of the Rosicrucian philosophy. Whatever may have been the true origin of the sect, one thing is certain, that its existence only became publicly known in the year 1605. At that time it created a great stir amongst the mystical Germans. No sooner were its doctrines promulgated, than all the visionaries, Paracelsists, and alchemists flocked around its standard, and vaunted Rosenkreuz as the new regenerator of the human race. Michael Maier, the physician of the emperor Rudolph, became initiated in its mysteries, and having travelled over all Germany seeking confidential instruction from its members, published a report of the laws and customs of the new fraternity, in 1615. An abstract of these published ordinances of the society will be the best and most concise explanation of its doctrines. They asserted, in the first place, "That the meditations of their founders surpassed everything that had ever been imagined since the creation of the world, without even excepting the revelations of the Deity; that they were destined to accomplish the general peace and regeneration of man before the end of the world arrived; that they possessed all wisdom and piety in a supreme degree; that they possessed all the graces of nature, and could distribute them among the rest of mankind, according to their pleasure; that they were subject to neither hunger, nor thirst, nor disease, nor old age, nor to any other inconvenience of nature; that they knew by inspiration, and at the first glance, every one who was worthy to be admitted into their society; that they had the same knowledge then which they would have possessed if they had lived from the beginning of the world, and had been always acquiring it; that they had a volume, in which they could read all that ever was or ever would be written in other books till the end of time; that they could force to, and retain in, their service the most powerful spirits and demons; that, by virtue of their songs, they could attract pearls and precious stones from the depths of the sea or the bowels of the earth; that God had covered them with a thick cloud, by means of which they could shelter themselves from the malignity of their enemies, and that they could thus render themselves invisible from all eyes; that the first eight brethren of the "Rose-cross" had power to cure all maladies; that, by means of the fraternity, the triple crown of the pope would be reduced into dust; that they only admitted two sacraments, with the ceremonies of the primitive church, renewed by them; that they recognised the fourth monarchy and the emperor of the Romans as their chief, and the chief of all christians; that they would provide him with more gold, their treasures being inexhaustible, than the king of Spain had ever drawn from the golden regions of eastern and western Ind." Such was the Rosicrucian confession of faith. They had six rules of conduct, which prescribed,

First, That, in their travels, they should gratuitously cure all diseases.

Secondly, That they should always dress in conformity to the fashions of the country in which they resided.

Thirdly, That they should, once in every year, meet together in the place appointed by the fraternity, or send in writing an available excuse.

Fourthly, That every brother, whenever he felt inclined to die, should choose a person worthy to succeed him.

Fifthly, That the words "Rose-cross" should be the marks by which they should recognise each other.

Sixthly, That their fraternity should be kept a secret for six times twenty years.

These laws, they asserted, had been found in a golden book in the tomb of Rosenkreuz, and as the prescribed time from his death had expired in the year 1604, the doctrines were accordingly promulgated, for the benefit and enlightenment of mankind. For some years these enthusiasts made numerous converts to their doctrines in Germany; but they excited little attention in other parts of Europe. In 1623, however, they made their appearance in Paris, and threw all the learned and the credulous into commotion. One morning the walls of the city were found covered with placards, to the following effect:—"We, the deputies of the principal College of the Brethren of the Rose-cross have taken up our abode, visible and invisible, in this city, by the grace of the Most High, towards whom are turned the hearts of the just. We show and teach without books or signs, and speak all sorts of languages in the countries where we dwell, to draw mankind, our fellows, from error and from death." At this strange announcement, some wondered, but more laughed. Two books, however, were shortly afterwards published, which excited real alarm and curiosity amongst all parties, about this dreadful and secret brotherhood. The first

of these works was called, a history of "The frightful Compacts entered into between the Devil and the pretended 'Invisibles'; with their damnable Instructions, the deplorable Ruin of their Disciples, and their miserable end." The other book was entitled an "Examination of the new and unknown Cabala of the brethren of the Rose-cross, who have lately inhabited the city of Paris; with the History of their Manners, the Wonders worked by them, and many other particulars." In these books, which, as we have said, caused great alarm, it was stated that the Rosicrucian society consisted of thirty-six persons in all, who had renounced their baptism and hope of salvation; that it was directly from Satan that they received the power which they possessed of transporting themselves from one end of the world to the other with the rapidity of thought; that they could speak all languages; that they had unlimited supplies of money; that they could render themselves invisible and penetrate into the most secret places, in spite of bolts and bars, and that they could infallibly tell the future and the past. Such were a few, and not the most heinous, of the attributes ascribed to this mysterious society by the two books which we have mentioned. In the midst of the commotion raised by these generally-believed disclosures, a second placard appeared on the walls of Paris, containing the following announcement:—"If any one desires to see the Brethren of the Rose-cross from curiosity only, he will never communicate with us. But if his *will* really induces him to inscribe his name in the register of our brotherhood, we, who can judge of the thoughts of all men will convince him of the truth of our promises. For this reason we do not publish to the world the place of our abode. Thought alone, in unison with the sincere *will* of those who desire to know us, is sufficient to make us known to them, and them to us."

In vain did the Parisian police endeavour to find out the publishers of these strange manifestoes, the church, however, soon took up the matter, and denounced them as heretics and sorcerers of the blackest dye. Then very name—it was affirmed—was derived from the garland of roses, in the form of a cross, hung over the tavern tables in Germany as the emblem of secrecy, and from whence has come the common saying *sub rosa* (under the rose). To these and other aspersions the attacked brotherhood replied by a lengthened exposition of their real doctrines. In this defence they denied that they used magic of any kind, or that they had any intercourse whatever with his Satanic Majesty. They declared that they had already lived for more than a century, and expected to live for many centuries to come; and that the knowledge of all things which they possessed had been communicated to them by the Almighty himself, as a reward for their great piety. They reiterated the assertion that their society had been founded by, and derived its name from, Christian Rosenkreuz, and consequently denied the derivation of their name which had been put forth by their enemies. They disclaimed all interference with the peculiar politics or religious opinions of any set of men; whilst, however, they denied the rightful supremacy of the pope, and denounced him as a tyrant. They likewise affirmed their innocence of the charges of immorality which had been brought against them; and declared, on the contrary, that the first vow taken on entering the society was one of chastity, the smallest infringement of which at once and for ever deprived the transgressor of all the advantages and powers which he had previously enjoyed. In contradiction of the old monkish superstitions of sorcery and demonology, they denied the existence of all such malevolent spirits, and asserted that, instead of being beset by such beings as these, man was surrounded by myriads of beautiful and beneficent beings, all anxious to promote his happiness. The air, they said, was peopled with sylphs, the water with undines or nauads, the inner parts of the earth with gnomes, and fire with salamanders. These half-angelic beings who possessed great power, and were unrestrained by the barriers of space or the obstructions of matter were the friends of men, and desired nothing so much as that men should purge themselves of all uncleanness, and thus be enabled to see and converse with them. They watched constantly over mankind by night and day, and sought to win for themselves human love that they might thus share the immortality of human souls, and at last enter with them into the regions of eternal bliss.

The excitement produced by these attacks and replies, though violent, was shortlived. One Gabriel Naudé, a publisher, dealt the finishing blow in France to the fantastic doctrines of the brotherhood, in a work called "Advice to France upon the Brethren of the Rose-cross." The invisible fraternity and their marvellous powers soon ceased to be spoken of and the star which they had raised gradually died away. But though thus unsuccessful in France, their doctrines still flourished in Germany and in England, where they had many converts. At the head of these latter was Robert Fludd, a learned physician, distinguished for his science and his mysticism. The father of English Rosicrucianism was the son of Sir Thomas Fludd, treasurer of war to queen Elizabeth in France and the low countries. He received his education at St. John's College, Oxford, and afterwards spent some years in travelling through France, Spain, Italy, and Germany. It was in this latter country that he first adopted the Rosicrucian philosophy. On his return to England he graduated as Doctor of Medicine, and practised as a physician in London with considerable success. His earnest advocacy of the cabalistic doctrines soon caused him to be looked upon as one of the high priests of the sect. His works in defence of the new philosophy were considered worthy of replies and refutations by Keppler, the celebrated German astronomer and mathematician, and Gassendi a distinguished French philosopher. After his death, in 1637, the Rosicrucian theory lost much of its ground in England. He had left behind him no one equally zealous in the cause with himself; and consequently the efforts of the English Brethren were confined to the publication at considerable intervals of obscure and unimportant works, which only served to show that the folly had not entirely died out. One of these books was published in London in 1652, and was called "The Fame and Confession of the Brethren of the Rosie-cross," by an alchemist, who called himself *Eugenius Philalethes*. A few years afterwards another enthusiast, named John Hayden, who styled himself "the servant of God and the secretary of Nature," put forth his "New Method of Rosicrucian Physic, for the cure of all diseases, freely given to inspired Christians." In his preface to this medley of nonsense and mysticism, he says, "I shall here tell you what Rosiecrucians are, and that Moses was their father, and he was the child of God. Some say they were of the order of Elias, some of Ezechiel, others define them to be the officers of the generalissimo of the world, that are as the eyes and ears of the great king, seeing and hearing all things, for they are seraphically illuminated as Moses was according to this order of the elements, earth refined to water, water to air, air to fire." Such is the jargon that could find not only readers, but dupes, in England less than two centuries ago.

Whilst Fludd in this country was propagating his vagaries

> "All strange and geason,
> Devoid of sense and ordinary reason,"

the cabalistic philosophy had an equally zealous apostle and head in Germany, in the person of Jacob Bohmen. This enthusiast, of whom it will be sufficient to say that his opinions were of the most orthodox absurdity, was born at Gorlitz, in Upper Lusatia, in 1575, and followed, till his thirtieth year, the occupation of a shoemaker. At the age mentioned, he heard of the Rosicrucian doctrines, and embraced them with the greatest zeal. He abandoned his trade, and took to book-writing on his adopted vagaries, which he explained and defended in language as sublimely ridiculous as any that has been employed in the same cause. His death in 1624, affected Rosicrucianism in Germany much as Fludd had done in England. He left behind him many disciples but none equal in energy or zeal to himself. As the seventeenth century wore on, believers in the cabalistic doctrines gradually became fewer and less clever in their defence, till at length the cherished fancies of Maier, Böhmen, Fludd, and the other high-priests of the sect, whose names we have left unmentioned, died away. Feeble and partial adherents occasionally were heard of, but the Rosicrucians, as a society, had passed away before the light of a more advanced philosophy and a truer science. Though we have spoken of the sect only in connexion with England, France, and Germany, it had some disciples in the other nations of the continent; they were

greatly inferior, however, both in numbers and enthusiasm to those of the three countries mentioned.

Such, then, is a brief sketch of the history and doctrines of the Rosicrucians. Out of them romantic theories, the reader need hardly be told, legends and tales innumerable have sprung, all full of mystery and wonder—the wild, the fantastic, and the marvellous. With these graceful and exciting creations the literature of England, France, and Germany is largely stored. Amongst them Shakspere's "Ariel" stands pre-eminent. To the same source are we to trace the airy tenants of Belinda's dressing-room, in Pope's charming "Rape of the Lock," and Fouque's exquisite "Undine." With such obligations to the Rosicrucians, no lover of poetry or romance can wish that they had never existed.

NOTES ON THE MANUFACTURES OF SHEFFIELD.

During the passage of some railway bills through the houses of parliament, in the session of 1845-46, affecting the interests of Sheffield, a variety of information was elicited relative to the manufactures of Sheffield. Amongst other points, the quantity of coal annually consumed formed an important branch of inquiry, to obtain a correct estimate of which, Mr Scholefield (at present one of the aldermen of Sheffield) took a statistical account of the number of hearths, &c., used in each of the various departments of Sheffield trade, and thus, by ascertaining the average consumption of coal or coke per hearth, he arrived at a tolerably accurate account of the quantity of coal annually consumed. These statistical accounts—which have not hitherto been made public—are useful, not only for the purpose of showing the quantity of fuel consumed, but in presenting us with a view of the productive power of the district, the diversity of the several branches of trade there carried on, and their relative comparison to each other. We have found it quite impossible to ascertain the total quantities or numbers of articles in the various departments of trade manufactured at Sheffield—*i.e.*, how many gross of files, razors, &c., are annually made, nor can any approximative calculation be made on this head from either the number of hearths or the number of hands employed in each branch:—

MANUFACTORIES CONSUMING COAL.

		Tons per annum
9	Anvil, vice, and hammer makers	936
10	Button makers' furnaces	416
5	Ditto, boiling furnaces	208
10	Coach and railway spring makers	1,040
15	Axletree makers	780
42	Grinding-wheel fires—20 fires each	4,200
60	Comb scale pressers' furnaces	624
70	Razor-scale pressers' furnaces	455
45	Flat pressers' furnaces	292
226	Table haft and scale pressers' furnaces	2,350
		11,301 tons.

MANUFACTORIES CONSUMING SOFT COKE.

		Tons per annum.
72	Razor makers' hearths	650
346	Table knife makers' hearths	2,249
270	Pen and pocket-knife makers' hearths	1,404
270	Scale and spring makers' hearths	1,404
130	Fork and butchers' steel makers' hearths	676
375	File makers' hearths	7,010
100	Whitesmiths' hearths	1,820
300	Edge tool makers' hearths	6,240
25	Brace, bit, and joiners' tool makers' hearths	260
170	Scissor makers' hearths	663
60	Blacksmiths' hearths	1,092
300	Saw makers' hearths	1,560
50	Sheep and shear makers' hearths	650
19	Spade and shovel makers' hearths	395
10	Garden shear makers' hearths	143
1	Machine makers' hearth	62
5	Chain makers' hearths	130
14	Sack needle makers' hearths	72
17	Lancet and fleam makers' hearths	44
		20,511 tons

As 1¼ ton of coal are required to make one ton of soft coke, 16,402 tons of coal would be annually consumed by the above.

25 brass-founders' furnaces, with 60 holes, consuming coal and coke, require 1,388 tons of coal annually.

39 iron founders, consuming coke, and 26 iron-founders, consuming coal only, require, together, 10,233 tons of coal.

In 1846 there were, in Sheffield, 179 steam-engines of 3,061 horse-power, consuming 79,586 tons of coal per annum.

The daily "get" of coal in the Sheffield, Rotherham, and Barnsley districts, was, at that time, 6,014 tons, and it was estimated that as much as 13,000 tons could be "got" by means of shafts then in use.

We conclude this notice with some information relative to the number of hands employed in most of the various branches of Sheffield manufacture—information which has been kindly furnished us by some intelligent friends, who have taken considerable pains to obtain the most accurate information on the subject:—

File makers, forgers, strikers, and cutters, together about 2,000. Boys and women, 800; grinders, 220; hardeners, 212. total, 3,232

Spring knife makers.—Hafters, 1,150; scale and spring forgers, 100, blade forgers, 320; pocket-blade grinders, 100; pen-blade grinders, 320: total, 2,350. Some 600 apprentices added to the above would give a grand total of about 3,100, or rather more

Saw makers.—Men and boys, about 300. Women in the proportion of one to eight men.

Saw-handle makers.—Men and boys, 230.

Saw grinders.—Men and boys, 225.

Edge tool makers.—Forgers, 200; grinders, 250; strikers, 200 total, 650.

Fork makers.—Forgers, 60, grinders, 120: total, 180.

Scissor makers.—Forgers, 110; grinders, men, 240; boys, 130; filers, dressers, putters together, &c., about 660: total, 1,170

Razor makers.—Grinders, men, 260; boys, 160.

Table-knife makers.—Hafters, about 1,200; boys, about 300, forgers and strikers, 850, grinders, 800. total, 3,150.

Scythe makers.—Forgers, strikers, and grinders, 165.

Joiners' tool makers, about 220.

Britannia metal makers.—Smiths, 130 men; 40 to 50 boys.

THINGS WONDERFUL AND TRUE.—With a view to truth, the human family inhabiting the earth has been estimated at 700,000,000, the annual loss by death 18,000,000. Now the weight of the animal matter of this immense body cast into the [illegible] less than 624,300 tons, and by its decomposition produces 9,000,000,000,000 cubic feet of gaseous matter. The vegetable productions of the earth clear away from atmosphere the gases thus generated, decomposing and assimilating them for their own increase. This cycle of changes has been going on ever since man became an occupier of the earth. He feeds on the lower animals and on the seeds of plants, which in due time become a part of himself. The lower animals feed upon the herbs and grasses which, in their turn, become the animal; then, by its death, again pass into the atmosphere, and are ready once more to be assimilated by plants, the earthy or bony substance alone remaining where it is deposited, and not even these unless sufficiently deep in the soil to be out of the insorbent reach of the roots and plants and trees. Nothing appears so cannibalising as to see a flock of sheep grazing in a country churchyard, knowing it to be an undeniable fact that the grass they eat has been nurtured by the gaseous emanations from our immediate predecessors; then following up the fact that this said grass is actually assimilated by the animal, and becomes mutton, where, perhaps, we may dine next week. It is not at all difficult to prove that the elements of which the living bodies of the present generation are composed have passed through millions of mutations, and formed parts of all kinds of animal and vegetable bodies, in accordance with the unerring law of nature; and consequently we may say with truth that fractions of the elements of our ancestors form portions of ourselves. Some of the particles of Cicero's or Æsop's body, perad venture, wield this pen. Why may not imagination trace the noble dust of Alexander till we find it stopping a bung-hole?

> 'Imperial Cæsar, dead, and turn'd
> Might stop a hole to keep the wind away!
> Oh, that that earth which kept the world in awe
> Should patch a wall t'expel the winter's flaw!'

MISCELLANEOUS.

BANKRUPTCY EXPLAINED.—The following "reasons for being so far back" were recently given in to the trustee on a bankrupt estate by the person failing, a grocer in a small business.—1st. Not having any experience in the small trade, so that I could not buy to advantage, and perhaps giving the little profit I had in overweight. 2nd. Selling a good quantity of sugar, and a very small quantity of tea—the sugar at a great loss, and tea being the only article that I have a profit on; so I lost more on the one than I gained on the other; and, beside the loss, I had 3d. to pay on every cwt. for carriage. 3rd. Lost about £1 by oil-cistern and syrup-casks bursting 4th Lost a great deal owing to provisions coming down in price every other day, and last, Not taking much above what would keep us for this some time back, although it had been all profit together.

ENJOYMENT OF LIFE.—Two wealthy gentlemen were lately conversing in regard to the period when they had best enjoyed themselves. "I will tell you," says one, "when I *most* enjoyed life Soon after I was twenty-one, I worked for Mr. ——, laying stone-wall at twenty cents. per day" "Well," replied the other, "that does not differ much from my experience. When I was twenty, I hired myself out at seven dollars per month. I have never enjoyed myself better since." The experience of these two individuals teaches that happiness *does not* depend on the amount of his gains or the station he occupies, that very small beginnings, with industry and prudence, may secure wealth.

ADVICE TO THE GIRLS.—Girls, do you want to get married, and do you want good husbands? If so, cease to act like fools. Don't take pride in saying you never did housework—never cooked a pan of chickens—never made a bed—and so on. Don't turn up your pretty noses at honest industry—never tell your friend that you are not obliged to work. When you go a-shopping, never take your mother with you *to carry the bundle.*

BITTER BEER.—In the *Medical Times, and Gazette* appears an article under the above head, from which we learn that the fashionable longing for bitterness having surpassed the bitterness of hops, manufacturers have, in despair, resorted to a more potent bitter, in the shape of strychnine, the active principle of *nux vomica*, one grain of which, the writer remarks, will have more effect than a canister of gunpowder, producing tremours, and in some cases permanent ill health The strychnine, it appears, is manufactured in large quantities in Paris, but its destination was for some time unknown to the French government. It was discovered, however, on inquiry, to be intended for exportation to England, to fabricate bitter beer, and not for home use, as the penalties for falsification in Paris are so stringent, that the pernicious use of this drug does not prevail. To give a bitterness to a pint of beer, the quantity of strychnine, it is stated, must be equal to a medicinal dose, and will in a very short time, inevitably give rise symptoms of poisoning The lovers "morning draught," as a "strengthener and appetiser," had best be cautious.

NEW MODE OF PACKING BOUQUETS.—Mr. Meredith, gardener to the Duke of Sutherland, has invented a plan by which cut flowers in bunches may be sent to any distance without injury. Two parallel lines of string, about an inch apart, are fastened between the four opposite sides of a square wooden box, so as to intersect each other in the centre, but at different levels. The shank of the bouquet is then to be passed down where the lines of cord intersect, imbedded up to the flowers in damp moss, and tied firmly to the bottom of the box In this way the bouquet is kept firmly in one position, and travels safely.

A VALUABLE RELIC.—There was exhibited, at a meeting of the Society of Antiquaries lately, a highly curious collection of Anglo-Saxon female personal ornaments, such as amulets, pins, rings, chains, &c., which had been found at various times in digging for foundations, &c, in different parts of the country. At the same meeting, Mr R Cole placed before the members some valuable relics found in South America. Among them was a female figure in a stooping posture, about eight inches in height, which had evidently been the support of a very large and, perhaps, highly valuable cup The figure alone was composed of as much pure gold as would manufacture several hundred sovereigns.

THE ELECTRIC TELEGRAPH.—The present means of insulating the wires of the electric telegraphs on the various lines of railway, appear, according to Mr. F R. Nindon—who read a paper lately on the subject at the Institution of Civil Engineers—to be extremely defective. To obviate one of the principal causes of imperfection, it is proposed to surround the insulators with a metallic substance, so as to prevent dew from being deposited on the porcelain cups of which the insulators are composed. The metal being a bad absorbent, the radiation from the porcelain is greatly checked, and the cup thus prevented from cooling down below the dew point. The adoption of these metallic coverings would, it was argued, render the working of the wires more certain in their action, and obviate the necessity of expensive underground operations

RESTORATION OF THE ROYAL TOMBS IN WESTMINSTER ABBEY.—This subject is attracting considerable attention among the architects, antiquarians, and lovers of the fine arts. It is proposed to restore the tombs in the various chapels of the abbey to a state similar to that in which they were at the time of their erection; but, that the repairs should not altogether destroy the feeling which many possess for ancient remains, it is thought by Mr Digby Wyatt and others, that a portion of each shrine, &c., should be left in its present state, as has been done with the arch of Titus at Rome. By this means, not only would these magnificent works of art be rescued from further decay, but their actual condition at the time of repair would be seen. At a meeting of the Institute of British architects, on the 22nd ult., it was determined to present a petition to the Queen, "praying her Majesty to appoint a commission for the purpose of taking into consideration the dilapidated state of the royal tombs in Westminster Abbey."

SLEEP.—There is no better description given of the approach of sleep than in one of Leigh Hunt's papers.—"It is a delicious movement, certainly, that of being well nestled in bed, and feeling that you shall drop gently to sleep. The good is to come, not past, the limbs have been just tired enough to render the remaining in one posture delightful; the labour of the day is gone. A gentle failure of the perceptions creeps over you, the spirit of consciousness disengages itself more, and with slow and hushing degrees, like a mother detaching her hand from that of her sleeping child, the mind seems to have a balmy lid closing over it, like the eye—'tis closed. The mysterious spirit has gone to take its airy rounds.

ANSWERS TO CORRESPONDENTS.

W. PYE and others who consult us on the subjects of courtship and matrimony, must excuse us if we decline answering their inquiries. We cannot furnish him with any specific for the cure of females given to hysterics.

A SCHOOL TEACHER.—We believe that most congregations of protestant dissenters, if not all, have English schools in connexion with their congregations or chapels, if not day-schools, at least Sunday-schools.

B. T. W., and, strange to say, two other correspondents, wish us to decide what they state to be a matter of some importance "Whether *upwards of a hundred* means below or above a hundred?" Are any of our correspondents sufficiently versed in arithmetic to furnish a reply?

A. JOHNSTON.—A portrait and brief memoir of Napoleon will be found in No. 7 of "The Working Man's Friend," New Series.

MARTHA.—You may bleach your "excellent straw hat" by exposing it to the fumes of burning sulphur, in a close chest or box, or by immersing it in a weak solution of chloride of lime, and afterwards washing it well in water. The former is a very unpleasant process; and, as in your neighbourhood there are several poor, industrious women, who will cleanse your hat nicely for a few pence, why should you give yourself so much trouble?

A TYRO.—"Civil law" is commonly defined to be that law which every particular nation or society of people has established for its own use, which is now as frequently called "municipal law," to distinguish it from that law which was used by the Romans, and collected under the auspices of the emperor Justinian into a code or body of laws.

R. A. (Dublin.)—A paper on "Telegraphic Communication" appeared in "The Working Man's Friend," New Series, No. 7, and on "Submarine Telegraphs" in No 21

LECTOR AB INITIO.—Salt is good, useful, valuable Never mind what was said to you "your "almost daily lecture" against it, what Dr Howard says against it Take it with "your meat," your "soup," &c. But because the moderate use of salt with fresh provisions conduces greatly to health, it by no means that salted provisions do so, especially if used for a length of time, or, as you term it, "continuously."

JAMES.—You will find a full and interesting account of the KOH-I-NOOR in Vol. 7, page 321, of "The Working Man's Friend." For to your other inquiry, we must refer you to Mr. Kossuth.

E. H.—It is not necessary that you should deposit your will in any particular place You should have it properly witnessed and signed. You may then keep it in your own desk, or in any drawer or place you may choose in your own house. Wills of deceased persons, especially if the property be large, or if it be likely to be contested, or if the survivors "administer" to the property, are deposited in the Will-office in Doctors'-commons on the payment of a small fee. The original is retained, and a copy is given to the persons concerned, also on payment of a small fee. Wills so deposited—the will of any person—may be examined by the payment of one shilling, and a copy of the whole, or of any portion, may be had at a small charge *per folio*, that is, 70 words.

R. W. jun.—You can have the first volume of "The Working Man" complete; or if you have the numbers, our publisher can supply you with a case for binding them. "The Popular Educator" will be made up in half-yearly volumes, containing *twenty-six* numbers.

W. G T—Most of the questions you put respecting photography you will find answered in the Manuals or Handbooks of Photography, many of which are now published.

A YOUTH.—The best way to improve yourself in composition will be to read and study the most approved standard publications, and to write down your own thoughts freely after such reading. As to what you term "revolutionary societies" and debating clubs, perhaps the less you have to do with them the better.

All Communications to be addressed to the Editor, at the Office, 335, Strand, London.

EGYPT: ITS EDIFICES AND ITS PEOPLE.

KARNAK AND DENDERA.

As the visitor passes over a dromos, or continuation of the avenue which leads to Karnak, a very imposing pylon, or gateway, attracts the attention: it was the work of Ptolemy Euergetes and Berenice, his sister (B.C. 246), who, according to the abominable practice of those days, was his wife and also his queen. Such gateways are very lofty, they have thick and very solid walls, and are highly decorated with sculptures, generally in *intaglio*, and a profusion of hieroglyphics. This particular one is a fine specimen of them, and may be compared with edifices like Napoleon's grand triumphal arch in Paris, which was erected for a purpose somewhat similar to that which appears to have prompted the monarchs of Egypt, at different periods, to add to the extent and glories of Karnak. Proceeding through this Ptolemaic gateway, another

RESTORATION OF THE RUINS OF KARNAK.

avenue, similarly adorned with Sphinxes, leads to the pyramidal towers of a temple behind this gateway. Here an idea may be formed of Homer's "hundred-gated Thebes," an expression which, as there are not the slightest traces of city walls, or gates, almost certainly refers, if it be more than a poetic expletive to the propyla, or gateways of the temples.

The front, or main entrance of the grand temple is on the north-west side, affording the first view of the most splendid temple in the world. Its extent is almost bewildering. From an immense doorway the eye looks into a building whose width is between three and four hundred feet, and length nearly twelve hundred feet; its walls are proportionately thick, massive, and lofty; while hundreds of columns, so large and grand as to excite unbounded astonishment, are seen at various distances, and in diverse positions, and form a feature in the scene unlike any the traveller has ever beheld. Then, there are the vast propyla, the lofty obelisks, the extensive courts, the sanctuary of red granite, and other objects which no words can adequately describe, but which cannot fail to excite in the most phlegmatic German or Englishman intense emotion. What destruction has the hand of violence wrought! Portions of columns are strewn about—broken walls meet the eye—and massive stones lie under the feet!

Thousands of hieroglyphics are there, many of them deeply important in an historical point of view, and sculptures, illustrative of so many and such various subjects, are found on every wall. "Never," says lord Lindsay, "were pages more graphic. The gathering, the march, the melée—the Pharaoh's prowess, standing erect, as he always does, in his car—no charioteer—the reins attached to his waist—the arrow drawn to his ear—his horses, all fire, springing into the air like Pegasuses—and then the agony of the dying; transfixed by his darts, the relaxed limbs of the slain—Homer's truth itself; and, lastly, the triumphant return, the welcome home, and the offering of thanksgiving to Amunre—the fire, the decrimination, with which these ideas are bodied forth—they must be seen to judge of it."

But let us look more particularly at the great hall of assembly. Having entered, be it remembered, through the pylon or doorway, crossed an open court or area nearly three hundred feet in length, with a double line of columns down the centre, and come to the propyla and entrance leading into the great

hall, a wall rises up aloft some eighty or ninety feet, and more than thirty feet in thickness. What immense blocks of stone are these—what strength they possessed—what towers of defence against assault they must have proved—what lintel stones are those over the doorway, more than forty feet in length! Let us enter the hall, and look about us. "It measures," says Wilkinson, "170 feet by 329, and is supported by a central avenue of twelve massive columns, 66 feet high (without the pedestal and abacus) and twelve in diameter; besides 122 of smaller, or (rather) less gigantic dimensions, 41 feet 9 inches in height, and 27 feet 6 inches in circumference distributed in seven lines on either side of the former." Stop for a while and examine one of these columns, so massive, wrought with so much skill, and adorned with such a variety of sculpture; what singular design has been displayed—what strange conceptions of art—what surprising accuracy in execution, along with equally surprising errors and faults, go which way we will, and the *coup-d'œil* is strikingly grand and impressive So many of the columns are standing, and in good preservation, that we could not have a finer specimen of Egyptian architecture than this, and the few that are prostrate, or half-fallen, afford us opportunity of observing more fully the degree as much as we will of the power of mechanical appliances of the of the quarries and put in their present place such extraordinary large blocks of stone Notice the sculpture on one of these columns; generally it is in intaglio, sometimes in bas-relief; what singular beauty and nobleness the heads and faces present, especially those of the female figure, but what scraggely ill-proportioned persons many of them have! One of the female figures, five feet two inches high, has a waist of five inches, and a foot of fourteen inches in length, in this was the usual proportion. Observe how nearly the artist approached to the perspective, and yet how sadly deficient his work is from ignorance of that important point in art, and particularly notice the prominence given to a religious view of all subjects, in the constant introduction of the gods and goddesses, the offerings made to them, and the hieroglyphics expressing the adoration of the deities, and the care of the kings to promote their worship and honour Look, too, at the walls of this grand hall or chamber, and, remembering that the king in whose reign it was erected lived some three thousand two hundred and thirty years ago, note the freshness and beauty of the colours, the bright blue, the dazzling vermilion, the pale green, the lovely yellow, and many others Does it not seem well nigh impossible that these colours could have lasted through so many centuries, and be even now strikingly beautiful? Observe, likewise, what is sculptured on the walls. You may not be capable of reading with fluency the story which the hieroglyphics tell, and, without much previous study, you will not see the reason or propriety of many things which appear very singular, not to say grotesque, but, nevertheless, you can enjoy such points as are open to the view of all; you can see what progress the ancient Egyptians had made in the arts of sculpture, painting, and architecture, you can form something of an idea of their warlike spirit, of their wealth, their luxury, their amusements, their occupations, and their religious sentiments and conduct, and you can appreciate their greatness in some or many respects, and mourn over their degradation and superstition in those matters which most truly manifest what spirit men are of And when we have spent hours in this way, in endeavouring to gain knowledge and instruction, and in the enjoyment of a scene the like to which the world nowhere else presents, we may seat ourselves on some fragment of a column, or on one of those immense blocks of stone which lie strewn around, and in melancholy mood, listening to the chirping of the birds who now inhabit these desolate halls, may muse over the destruction which awaits the might, majesty, and dominion of man.

Vast as is the main temple, and astonishing as it is in every respect, it does not constitute all that meets the eye and fills the mind with inexpressible emotions There is the avenue of sphinxes through which Karnak is approached from the south, and a majestic pylon, of the days of the Ptolemies Other and grander things are in the vicinity. Numerous buildings sculpture, and adorned with colossal statues; and there, some other edifice, not directly connected with the great temple, but included in the ruins, meets the view; and, mingled with the evidences of later life, and the sad falling off from former greatness—in the mud huts of the peasantry, sometimes built in and upon the remains of ancient temples—tends to deepen the impression which Karnak, as a whole, is calculated to make, on the mind and memory of the least imaginative person. Add to this, too, the consideration, that Karnak was, after all, only a part of old Thebes; that it was connected with Luxor by the dromos of Sphinxes; that Luxor was connected with the splendid temples, palaces, obelisks, and statues, on the west bank, and that the whole covered a circuit of, it is said, thirty miles, and nothing more will be needed to prove, that on this plain are the grandest, most astonishing, and most interesting ruins in the world. Denon, a French traveller, who accompanied the expedition which Bonaparte sent into Egypt, exclaimed, "One is fatigued with writing; one is fatigued with reading; one is stunned with the thought of such a conception (as Karnak demands). It is hardly possible to believe, after having seen it, in the reality of the existence of so many buildings, collected at a single point, in their dimensions, in the resolute perseverance which their construction required, and in the incalculable expenses of so much magnificence. On examining these ruins, the imagination is wearied with the idea of describing them. Of the hundred columns of the portices alone of this temple, the smallest are seven feet and a half in diameter, and the largest twelve The space occupied by this circumvallation contains lakes and mountains. In short, to be enabled to form a competent idea of so much magnificence, it is necessary that the reader should fancy what is before him to be a dream, as he who views the objects themselves occasionally yields to the doubt, whether he be perfectly awake."

Of course it will be understood that various monarchs of Egypt, to gratify their pride or vanity, or manifest their piety, made various additions to the earlier structures. Wilkinson is of opinion, that no part remains of the original foundation of the temple; but as the name of Osirtasen I., the Pharaoh who ruled Egypt in the days of Joseph, or earlier, as Osburn thinks, has been found on some prostrate columns, near what was the sanctuary, it proves that we have here not only the oldest building in Thebes, but ruins which carry us back about three thousand six hundred years. Later kings added the obelisks and the chambers near the sanctuary Thothmes III., in whose reign the Exodus took place, "made large additions to the buildings and sculptures, as well in the vicinity of the sanctuary as in the back part of the great inclosure; where the columnar edifice (to the south-east), the side chambers, and all the others in that direction, were added by his orders." Subsequently, Osirei, a great conqueror, and his son Remeses II., probably the far-famed Sesostris, beautified and enlarged the bounds of the temple: the former added the grand hall, spoken of above, and the latter caused to be designed and executed, very many of those striking sculptures on the north-east side, which illustrate the extent and variety of his martial achievements. The son of Remeses II. continued the work begun by his illustrious father, and built the area in front, with massive prepyla, preceded by granite colossi, and an avenue of Sphinxes; and succeeding monarchs adding still more and more, the several edifices by degrees became united in one grand whole, connected either by avenues of Sphinxes, or by crude brick inclosures. After the time of Cambyses, B.C. 525, who manifested such intensity of rage against the monuments and temples of Egypt, some other, but less important additions were made, and various repairs and sculptures were introduced, as late as the last ages of Egyptian independence. Ptolemy Lathyrus, however, B.C. 116, exasperated against the rebellious citizens of Thebes, appears to have done this ancient city greater injury than even the Persian conqueror; and as we are informed, reduced it to so deplorable a state, that it "no longer deserved a rank among the cities of Egypt." Since that period, it has gradually sunk into insignificance, and for ages has lain in ruins.

the visit of the French and Italian commission to Egypt, in 1828, Champollion le Jeune had discovered, on the exterior south-west wall, near the doorway, the cartouche, which proved, on examination, to refer to the capture of Jerusalem by the Egyptian king, called Shishak in the Bible. The passage in which this expedition is spoken of is as follows:—"It came to pass, that in the fifth year of king Rehoboam, Shishak, king of Egypt, came up against Jerusalem, because they had transgressed against the Lord, with twelve hundred chariots, and threescore thousand horsemen; and the people were without number that came with him out of Egypt; the Lubims, the Sukkiims, and the Ethiopians. And he took the fenced cities which pertained to Judah, and came to Jerusalem." It having pleased God to warn the king and princes of the consequences of their disobedience and sin, they found grace to repent and humble themselves, so that he did not destroy them, or pour out his wrath upon Jerusalem, by the hand of Shishak: nevertheless, says the Lord, by his prophet, they shall be the servants of the king of Egypt, "that they may know my service and the service of the kingdoms of the countries. So Shishak, king of Egypt, came up against Jerusalem, and took away the treasures of the house of the Lord, and the treasures of the king's house, he took all: he carried away also the shields of gold which Solomon had made"* This was in the year B.C. 971, according to the usual chronology On the king's return to Egypt, various sculptures were added to the walls of the temple at Karnak, illustrating his conquests, and the cities and countries which he had subdued, this of the "kingdom of Judah," among the rest.

Here may be observed the figure of a captive, bound and attached to a large number of others on the same wall The king, whose proportions are colossal, is represented as standing erect and threatening, with his arms stretched out, the group of prisoners and foreigners, whom he is holding by the hair with one of his hands He conducts before the Theb in triad (*i. e.* Amn, Neith, Khunsu), the chiefs of more than thirty nations, whom he has subdued they are bound by the neck, and each of them has near him an embattled shield or buckler, in which is inscribed the name of the conquered country or city. The prince is one of these he has a pointed beard, and the physiognomy of an Asiatic, and the name of his kingdom is written in the shield The king, whose arms effected all this, bears the name of Shoshonk, the Sesonchis of Manetho's lists, and evidently the same as Shishak of the Scriptures The hieroglyphics are arranged according to the manner in which the phonetics are to be read they are as Chevalier Bunsen gives them, IUTAHA MALUK, the "king-kingdom of Judæa." Wilkinson expresses the hieroglyphics by YOODA-MELCHI: Champollion-Figeac gives JOUDA HAMALEK; but all amount to the same thing in substance.

The ruins at Dendera, or Tentyra, are situate on the west bank of the Nile, four hundred and sixteen miles from Cairo, opposite Kineh, which is a modern town of some importance, because of its proximity to Kosseir, on the Red Sea, and its connexion with the probable course which the overland travel and trade to India will assume. According to Wilkinson, the name Tentyra, in Coptic *Tentoré* or *Nikentore*, seems to have originated in that of the goddess Athor or Aphrodité, who was particularly worshipped there; and the hieroglyphics, as well as the Greek inscription on the front of the main temple, show that it was dedicated to the goddess of love and beauty Entering a rather fine pylon, and walking several hundred feet up a narrow dromos, with walls of crude brick on either side, which leads directly to the portico of the temple, a descent by steps of some twenty feet brings the visitor to the level of the floor, and affords an opportunity to inspect an Egyptian temple in a better state of preservation than any hitherto described. The massive columns of the portico are but little injured by time or violence; the walls are all standing, and the sculptures and hieroglyphics in a state of comparative completeness; the roof is preserved; and the interior rooms and chambers, though more or less defaced from various causes, enable one to form a good idea of the internal arrangements of an ancient temple, devoted to the worship of an Egyptian deity. The portico is supported by twenty-four columns, the circumference of each of which is nearly twenty-nine feet. The portico is open to the front, above the screens that unite six of its columns; and in each of the sidewalls is a small doorway. To the portico—according to Wilkinson—succeeds a hall of six columns, with three rooms on either side; then a central chamber, communicating on one side with two small rooms, and on the other with a staircase. This is followed by another similar chamber (with two rooms on the west and one on the east side), immediately before the isolated sanctuary, which has a passage leading round it, and communicating with three rooms on either side. The total length of the temple is about two hundred and twenty feet, by ninety-four, or across the portico a hundred and fifteen feet: its date, according to the inscription on the fillet of the cornice of the portico, is of the time of the Emperor Tiberius.

The circumstance just mentioned will account for the fact, which is quite evident even to an inexperienced observer, that the temple at Dendera is of a later and a declining style of art. In the wonders of ancient Thebes, despite of all defects, there is a nobleness and massive grandeur in the architectural remains of the temples, obelisks, statues, &c., which cannot but attract the attention of the most unscientific visitor. Here, however, the capitals of the columns appear deficient in taste, quite to the extent with which they are over-ornamented; they want the simplicity and grace which characterised the earlier works of art in Egypt, the sculptures are not executed with the skill and care which might have been expected; and, as has been asserted, the hieroglyphics are ill adjusted, and in crowded profusion But though the temple of Dendera is open to criticism, it wears an imposing appearance, and is not devoid of beauty and grandeur, and by the older travellers, before its actual date was known, it was spoken of in terms of the highest, nay, most extravagant admiration, However it may be esteemed by those who come after the present race of Egyptologers and travellers, there can be no doubt, that it will always be looked upon with interest, as a noble specimen of architecture, as it existed in the days of the early Roman emperors, and when science was on its decline in the land of the Ptolemies

On the roof of this temple is sculptured a zodiac, which was asserted by some authors here, as well as on the continent, to be of extraordinary antiquity. M. Jomard, finding also another at Esneh, made the date of one of them at least 1923 years before the Christian era, and as a medium, assigned three thousand years as the most probable period during which they had existed on the occurrence of that event. M. Dupin made the zodiac four thousand years old at the very least; while M. Gori would not diminish aught of seventeen thousand years. All these calculations were directed either expressly or implicitly against the chronology of Moses, which they affected to consider as completely exploded. Infidels exulted as they anticipated the downfall of Christianity, or as they thought it had already taken place. But short-lived, indeed, was their triumph: Champollion, by deciphering its hieroglyphics, had read upon the zodiac of Dendera the titles of Augustus Cæsar, and upon that at Esneh the name of Antoninus; and thus it is manifest that the temple said to be four thousand years older than the Christian era, was built about the time of its commencement; while that at Esneh, to which an antiquity had been assigned of at least seventeen thousand years before that period, ought to have been dated one hundred and forty years after it And such shall still be the result of the discoveries in which men are engaged, the more enlightened and persevering the examination of nature and art, the more abundant will be the evidence of the authority of Scripture, which came not in old time by the will of man, but holy men of God spake as they were moved by the Holy Ghost.

* 2 Chron. xii 2—9.

THINNESS OF LEAF-GOLD.—In the process of gold-beating the metal is reduced to laminæ or leaves of a degree of tenuity which would appear fabulous, if we had not the stubborn evidence of common experience in the arts as its verification A pile of leaf gold to the eighth of an inch would contain 282,000 distinct leaves of metal! The thickness, therefore, of each leaf is in this case the 282,000th part of an inch. Nevertheless, such a leaf completel[illegible] d to gild, it moreover protects such objects from the action of external agents as effectually as though it were plated an inch thick

THE MAN IN THE IRON MASK.

A FRENCH romance of the time of Louis XIV., of which the following are the principal details, was long regarded by many with intense interest. A youthful prisoner, of noble appearance and great personal beauty, was secretly sent to an island on the coast of Provence, wearing on his journey an iron mask, which was so contrived that he could take his meals without uncovering his face, the disclosure of which was to be followed by instant death. His rank appeared from the fact, that on Louvois, the king's minister, paying him a visit, he stood while addressing him, and treated him with the greatest respect. One day the prisoner traced some words with a knife on a silver plate, and threw it from a window into the sea. A fisherman brought it to the governor of the island, who, finding he could not read, dismissed him, saying he "was fortunate in his ignorance." On this officer being appointed to the command of the Bastille, his prisoner was conveyed secretly to Paris, and continued under his charge; but his table was amply provided, all his requests were granted, and rarely was the governor seated in his presence. He was fond of lace and of fine linen, and amused himself by playing on the guitar. The very tone of his voice inspired interest; he was never known to complain, nor did he ever give the slightest intimation of his character and rank. The mystery respecting him remained unbroken to the last. Even the physician, who frequently attended him, never saw his face, though he was in the habit or looking at his tongue. He died in 1703, and was buried at night in the cemetery of St. Paul. The darkness gathered about him still continued impenetrable. The successor of Louvois, M. de Chamillart, when on his death-bed, was entreated by his son-in-law to tell him who this prisoner was He replied, it was a solemn secret of state, which he had promised never to reveal.

That curiosity should be greatly excited by such a tale, and that the imagination should determine, despite of all difficulties, *who* was its hero, was naturally to be expected. At one time the prisoner was an Armenian patriarch; at another a minister of finance who had fallen into disgrace. Some determined that he was a son of Louis XIV. and Mademoiselle de la Vallière, overlooking the fact that he was said to have been buried twenty years *before* the mysterious prisoner; while others, equally sagacious, affirmed that he was the Duc de Beaufort, who, to all appearance, had been beheaded by the Turks at the siege of Candia. Other speculations, however ingenious in the view of their authors, were of no more value.

But, amongst these, there was one that the man in the iron mask was a private agent of Ferdinand Charles, duke of Mantua, and that he suffered his long and strange imprisonment for having disappointed the French monarch in a secret affair of state, the particulars of which could not be disclosed without involving the principals in shame. That this is the most probable solution of the mystery is established in a work extracted from documents in the French archives, by the late Lord Dover. The tale most likely to be true is as follows:—

When Louis XIV. had reached the height of his gradeur, and his courtiers were still intent on gratifying his ambition, the Abbé d'Estrades, his ambassador to the Venetian state, was desirous to obtain for him the town of Casal, a fortress in the territory of the duke of Mantua, and capital of the Montferrat. The town was the key of Italy; but an uneducated and dissipated prince was likely to surrender it for some pecuniary advantage, when subtilely plied for this purpose by a French ambassador. At this time there was a native of Bologna, a bachelor of laws, in the university of that place, and a senator of Mantua, Count Matthioli, who had been a minister highly favoured by the duke's father, and who still busied himself in watching public affairs, which, with regard to the duke's interests, were somewhat endangered from the power of the Spanish government at Milan, and the growing influence of the house of Austria in his dominions. This man was therefore selected to be the agent of D'Estrades, and easily led the duke to believe that his only escape from formidable evils depended on his seeking the protection of France, especially as he understood that Louis, on paying him a sum of money, was to send French troops into Italy, at the head of whom he was to be placed.

So confident was D'Estrades of the success of the plot, that, in a letter to Louis, he expressed his delight at Casal being about to be annexed to the crown of France; and, though he addressed a tyrant, he blessed his fortune for affording him the honour of serving a monarch whom he revered as a *demigod*. But formidable difficulties often arise in the path of the plotters of evil. The duke, closely watched by the Austrians and his mother, a lady of that family, not being able to receive D'Estrades publicly, promised him an audience in the ensuing carnival at Venice, when they were to meet in disguise, while Louis, cautiously intent on his selfish purposes, flattered the hopes which the duke entertained.

At length the duke and D'Estrades met by midnight at Venice—the former being impatient for the conclusion of the treaty, from his being in urgent need of French protection; and the result was that Matthioli was despatched to Paris, where the compact was drawn up that the duke should receive 100,000 crowns for admitting a French force into Casal, while the agent of this scandalous artifice obtained a large reward, and promise of preferment for his relations.

The fact is strangely overlooked, that he who offers to injure others for you is likely to render you a victim as readily for them; and so it was in the present instance. Instead of Matthioli returning to France, as had been agreed, he made a variety of excuses for delay, and at last declared that his master, the duke, had been compelled to execute a treaty which would prevent his keeping his engagement with France. It was plain, therefore, that Louis had been duped, and that, too, by the obscure minion of a petty Italian prince, whom he instantly ordered to be imprisoned, and to be allowed no intercourse with any one. Matthioli was not then in Paris; but soon after meeting D'Estrades at Turin, and boldly urging the payment of his expenses in the late treaty, the abbé met the crafty demand with equal artifice, and on their arriving together within the French territory, the agent of his nefarious stratagem was arrested. Thenceforward, and for a space of more than twenty-four years, Matthioli remained a prisoner—first at Pignerol, next at Exiles, then at the Isle of St. Marguerite, and lastly in the Bastille. In November, 1703, a slight illness came on, and he died the next morning, at the age of sixty-three. As every means had been adopted during his life to conceal his real name and history, so on his decease the keepers scraped and whitewashed his prison-walls, reduced to ashes even the doors and window-frames of his apartments, and melted down all the silver, copper, or pewter vessels which had been used in his service. When the records of the prison were made public, in 1789, it was found that the leaf referring to him had been removed.

Thus the charms of an attractive romance are—if this account be true—totally destroyed. The mask which excited such interest was not an iron one. It appears to have been of black velvet, fitted to Matthioli's face with strong whalebones, fastened with a padlock behind his head, and still further secured by a seal. The prisoner, so young, noble, and dignified, was a man who had "fallen into the sere and yellow leaf;" and his clothes, whatever they might have been at first, were ordered to last him for three or four years together. Above all, he was a designing politician, and the ready tool of D'Estrades, who thought him well adapted to his atrocious purposes. This story suggests an impressive moral.

APRIL.—A SONNET.

BY JOHN GREET.

HAIL! lusty APRIL, with thy garniture
Of virent herbs, and wide-distending buds;
Come, with thy ruddy cheek, and bosom pure,
And pipe thy vernal music through the woods.
Tend meadows tessellate with virgin flowers,
Pleach floral wildings for thy sister May,
While hamadryads trim their sylvan bowers,
And lark and blackcap weave a dainty lay.
Emblem of life! though girt with changeful hue,
Thou still canst smiles of hope and cheer dispense,
As, from the chalice of thine upper blue
Droppest the sweet fructific influence
Thy charms are many; but, as fervid bard of yore,
Be mine to worship at the daisy's shrine, be mine its mystic lore.*

Leamington Spa.

* It is said that the poet Chaucer was wont to lie for hours looking with admiring contemplation on the daisies. [The above sonnet would have appeared at an earlier date had it arrived.—ED.]

JOHN FLAXMAN.

In speaking of our favourites, we are apt to begin with the heroic; thus, then, we may make use of the family tradition of the Flaxmans:—Four brothers fought, side by side, for liberty and the parliament, in the celebrated battle of Naseby. James, the eldest, was shot through both arms in pursuing the king; Francis, the second, died upon the field of victory; the third brother followed the fortunes of the triumphant army, and distinguished himself in Ireland. John, the fourth and youngest, survived the conflict of that day, and retired from the profession of arms to become a farmer in Buckinghamshire. The second in descent from this farmer was a poor artist—a moulder of figures for the sculptors, and the keeper of a little shop in New-street, Covent-garden, for the sale of plaster-cast and so on. Well, this obscure man was in the habit of going from place to place in search of employment, accompanied by his wife, and in the course of one of his professional pilgrimages his second son was born in the city of York. The day was the 6th of July, and the year 1755, on which John Flaxman first saw the light.

He was a poor, weak, deformed child, when, at the age of six months, his father and mother brought him home to their house in London. The father was a worthy man; but of the mother of the little boy we know little, except that she is said to have been rather remiss in her household duties. In the various biographies of Flaxman, the future sculptor and royal academician, is spoken of, in his fifth or sixth year, as a quiet, solitary child, sitting on a high stool behind his father's shop-counter, surrounded by books and papers, and getting up and down and moving about the house by means of two crutches. Allan Cunningham draws a touching picture of the youth at this period. His weakness prevented him from associating with the children of his own age, and he had to seek amusement through many a solitary hour by himself. His mother was frequently in the shop with her husband, watching over the health and education of her patient little favourite. His grave but cheerful deportment, his thirst for knowledge, and his love of drawing, began to attract the notice of the customers; and, as the customers of a figure-dealer are generally people of some information and taste, they could not avoid perceiving that this was no common child, they took pleasure in looking at his drawings, in hearing him describe such books as he read, and in the rapture of his looks, when, in their turn, they told him of poets, sculptors, and heroes. It was discovered, too, that, child as he was, he had not confined himself to the copying of figures around him, but had dipped into Homer, and attempted to think and design for himself.

FLAXMAN.

From such a beginning it was easy to prefigure a future of renown. The solitary child was the mental father of the man. He laboured at his studies incessantly, and actually made a number of small wax and clay models, some of which are still in existence, and are said to possess considerable merit.

But what should a sick, crippled child and its fond father do with ambitious thoughts? What the utility of fostering that which might afterwards be but a vain hope? When in after years his name became famous in the world, who remembered the little boy with the bright eyes and pale cheeks who sat behind his father's counter? Few indeed, and yet, to the habits of study there engendered the world is probably indebted for much that made the after works of the sculptor celebrated.

In his tenth year, however, a great change was observable; and before he had entered his eleventh, he had thrown away his crutches and his melancholy and began to enjoy life. Who now so full of animal spirits? Who now so jubilant of health and gaiety as young John Flaxman? But he was not forgetful that his father was still a poor man, and that if he would rise in the world—as his young dreams had promised him he would—he must be up early and work hard. He had determined to be a sculptor; and as his health and strength increased he drew and modelled most industriously. Indeed, all who knew him seemed to look forward to his future success as a thing of course.

About this time his mother died; and his father, setting his affairs in order, took a larger house in the Strand, and soon afterwards married again.

In 1770, being then in his fifteenth year, Flaxman—having for a long time past assiduously prepared himself for the occasion—became a student at the Royal Academy. He carried his simple, earnest nature from his father's shop to the studio and the lecture-room; and in the same year he exhibited a waxen figure of "Neptune," which was much admired. This was his first really public work; in 1827 he exhibited a marble statue of John Kemble, which was his last—a period of fifty-seven years intervening. To trace the long succession of famous drawings, statues, historical subjects, and busts, which through all these years appeared with the name of Flaxman engraved on them in the imperishable characters of genius, would be to write the real history of Flaxman. Such a course is, however, neither within our space nor scope; as we have said on more than one occasion, it is the chief object of the FRIEND to *promote* rather than to *satisfy* inquiry.

In his fifteenth year Flaxman gained the silver medal of the academy; and in time he became a candidate for the gold one, the reward of the highest merit. At this period he is thus described by one who knew him well:—"Though little, and apparently weak of body, he was both active and strong—a match for most of his companions in feats of agility, and more than a match for them in all that regarded genius. He had an earnest, enthusiastic look, and the uncommon brightness of his eyes and the fineness of his forehead were not to be soon forgotten. His fellow-students perceived his merit—the grave, the mild, and the proud boy was generally respected; and when he became, in opposition to Engleheart, a candidate for the gold medal, all the probationers and students cried out 'Flaxman! Flaxman!'"

Notwithstanding his high hopes, Flaxman did not win the prize. That he felt disappointed and deeply hurt, there is no doubt, but his failure did not make him discontented or morose; he did not blame his fortune or curse his unlucky stars; nor did he even accuse Sir Joshua Reynolds and the academicians of want of foresight and judgment in choosing another before him—as he might have done, and yet not been far from wrong; but when the news of his failure reached him he burst into tears; and he himself tells us, that this sharp lesson humbled his pride, and made him determine to redouble his exertions, so as to put it, if possible, beyond the power of any one to make such a mistake for the future.

He went on working and studying nevertheless, and as his father could not afford to support him altogether, he did what many other great men have done as well as he—that is to say, he sought employment which would provide for his wants while his probationary years went on. It does equal honour to employer and employed, the one to pay for talent and the other to exert those gifts with which he may be endowed on even humble works. Thus, when we hear that for several years John Flaxman was employed by the Wedgwoods in making designs for their pottery, we feel that no better apprenticeship could be found for a young and ambitious artist.

For ten years Flaxman continued to exhibit his works at the Academy—busts, clay models, plaster-figures, and some few works in marble. In 1782 he quitted his paternal roof, took a house in Wardour-street, Soho—a street since desecrated by art's shams—and took unto himself a wife. When Reynolds heard of his marriage he told him that he was "spoilt for an artist." Flaxman had wedded a quiet, loving girl called Ann Denman, and when he heard this saying of the President's, a cloud for a moment hung upon his brow: going home, he said to his young wife, "Ann, I have long thought that I could rise to distinction in art without studying in Italy, but these words of Reynolds have determined me, I shall go to Rome as soon as my affairs are fit to be left, and to show him that wedlock is for a man's good rather than for his harm, you shall accompany me. If I remain here I shall be accused of ignorance concerning those noble works of art which are to the sight of a sculptor what learning is to a man of genius, and you will be under the charge of detaining me."

In this resolution the quiet wife concurred, and though five years elapsed before it could be put into practice, to Rome at last he went. A picture of Flaxman's house in Wardour-street at this time is thus preserved in the words of one of his familiar friends:—"I remember him well, so do I his wife and, also his humble little house in Wardour-street. All was neat, nay, elegant, the figures from which he studied were the finest antiquities, the nature which he copied was the fairest that could be had; and all in his studio was propriety and order. But what struck me most was the air of devout quiet which reigned everywhere; the models which he made, and the designs which he drew, were not more serene than he was himself, and his wife had that meek composure of manner which he so much loved in art. Yet better than all was the devout feeling of this singular man; there was no ostentatious display of piety; nay, he was in some sort a lover of mirth and sociality; but he was a reader of the Scriptures and a worshipper of sincerity, and if ever purity visited the earth she resided with John Flaxman."

In the "Eternal City," surrounded by the imperishable works of the great masters, Flaxman remained from 1787 to 1794. In Rome he saw, he tells us, that "the great artists of Italy approached, as near as the nature of their materials would permit, the illustrious poets of the earth that they had impressed on all their works a grave beauty and divinity of sentiment which almost justified the superstitious adoration of the people. Into art, in fact, Italy poured out the first flood of her spirit, her young and enthusiastic vigour was directed to the task, and works of surpassing beauty became as abundant as flowers in spring. Learning was not then universal; men of genius had not been taught to dread the application of other rules than those of nature, the fulness and overflow of knowledged had not produced querulous taste and captious criticism; and though there was much that was objectionable, there was thrice as much of what was noble and magnificent."

During all the time of his stay in Rome, however, he had to work hard, and his illustrations of Homer, Hesiod, Æschylus, and Dante, remain to attest his industry and talents. On his return to his native country, he was received as an equal of Banks, Bacon, and Nollekens. Fortune now seemed to smile upon him, and for more than thirty years his name stood highest on the roll of England's sculptors. After being elected an associate, and afterwards an academician, he was at last requested to accept the Professorship of Sculpture in the Royal Academy. In 1801 he commenced his famous series of lectures on art, and in 1826 he died. A singular occurrence preceded his death. The winter had set in, and as he was never a very early riser a stranger found him one morning at breakfast about nine o'clock. "Sir," said the visitant, presenting a book as he spoke, "this work was sent to me by the author, an Italian artist, to present to you, and at the same time to apologise to you for its extraordinary dedication. In truth, sir, it was so generally believed in Italy that you were dead, that my friend determined to show how much he esteemed your genius, and, having this book ready for publication, he has ascribed it 'To the memory of Flaxman.' No sooner was the book published than the story of your death was contradicted, and the author affected by his mistake, which, nevertheless, he rejoices at, begs you will receive his work and his apology."

In less than a fortnight afterwards, the President and Council of the Royal Academy followed him to his grave, in the churchyard of St. Giles in the Fields. On his tombstone are these words:—

JOHN FLAXMAN, R.A., P.S.

Whose mortal life was a constant preparation for a blessed immortality. his angelic spirit returned to the Divine Giver, on the 7th of December 1826, in the seventy-second year of his age.

"The elements of Flaxman's style," says Sir Thomas Lawrence "were founded on Grecian art—on its noblest principles, on its deeper intellectual power, and not on the mere surface of its skill. Though master of its purest lines, he was still more the sculptor of sentiment than of form; and whilst the philosopher, the statesman, and the hero, were treated by him with appropriate dignity, not even in Raphael have the gentler feelings and sorrows of human nature been treated with more touching pathos than in the various designs and models of this inestimable man. Like the greatest of modern painters, he delighted to trace from the actions of familiar life the lines of sentiment and passion; and from the populous haunts and momentary peacefulness of poverty and want, to form his inestimable groups of childhood and maternal tenderness with those nobler compositions from Holy Writ, as beneficent in their motives as they were novel in design. In piety the minds of Michael Angelo and Flaxman were the same—I dare not assert their equality in art."

WORKING MEN'S MEMORIAL TO THE LATE SIR ROBERT PEEL.—Mr Joseph Hume, M.P., the chairman of the committee, in a letter to the London papers, says:—"The committee appointed at the public meeting held on the 7th August, 1850, at the Whittington Club-room, to collect subscriptions from the working classes for a memorial to the late Sir Robert Peel, have closed their labours, and the auditors having, on the 6th inst., examined all the accounts and certified their accuracy, it may be satisfactory to you, readers to know the result. Including the subscriptions begun at the Belvidere House Printing Office, there has been received the sum of £1,737 6d, chiefly in penny subscriptions, and that amount has been paid into the bank of England, to be invested in Three per Cent Consols, in the names of three trustees, and in the course of next month the committee will decide in what manner that sum shall be employed, so as to confer the greatest possible benefit on the working classes. The committee have already decided that the yearly interest of the fund shall be applied to educational purposes, under the title of 'The Working Men's Memorial to Sir Robert Peel,' and they will spare no endeavours to render its application judicious. It appears, on examination, that these subscriptions have been received from upwards of 350 towns and villages; while in other towns the subscription that was commenced for this fund became sufficient in amount to establish a local memorial, which the committee in every case encouraged. The number of individual subscribers is about 250,000, amongst whom are English workmen at St Petersburg, who have contributed £5 towards the fund. The expenses of the committee for printing, sending out between 4,000 and 5,000 circulars, and answering applications for books, lists, office charges, &c., amount, on the whole, to £295 14s. 9d up to the present time, and the committee intend to defray the whole of that amount by contributions from their own number, and from other friends of the late Sir Robert Peel, so that the entire amount of subscriptions collected shall remain applicable for the purposes above stated. A complete list of the names of the persons and places from which subscriptions have been received, and of the amount subscribed at each place, has been prepared; and should there be funds sufficient, this list will be published, so as to satisfy every subscriber that his mite has been received, and will be applied for the objects intended."

THE IMPORT AND EXPORT TRADE OF THE UNITED KINGDOM.—From recent official returns, printed by order of the House of Commons, we learn that in 1822 the value of the imports into the United Kingdom, calculated at the official rates of valuation, amounted to only £30,631,141, and in 1850 they reached to £100,460,433. In 1822 the exports from the United Kingdom were £53,470,099, and in 1850 they had reached to £197,309,876 There is also an increase in the value of the articles and produce of manufacture of the United Kingdom exported In 1822 the real or declared value was £36,966,623, and in 1850 the value of such exports amounted to £71,367,885. There has been an improvement in the trade of this country until it has reached its present high state, as evidenced by the document now printed.

EXPORTS FROM THE UNITED STATES.—The value of the cotton exported from the United States for the year ending June, 1851, was 1,123,153 dollars, 17 cents. The value of the exports of breadstuffs for the same period was 20,051,373 dollars, being 18,104,131 dollars less than the preceding year A dollar is about 4s. 6d English.

* The army now number nearly 400,000 men
† In 1848 the number was 620,000.
‡ The war footing is 492,000.

SCENES IN HUNGARY.

ABOU[illegible] from Karansebes, upon a conical hill which rises [illegible] Muntam Mika, there is a small square tower, [illegible] on, supported by some amount of historical [illegible] to have once been the prison of the gay and celebra[illegible]s Ovidius Naso; and it has received a local habitation [illegible] by calling the building "Ovid's Tower." However [illegible]d poetic popular belief may be, however, it is not always [illegible] to allow our feelings even in these small matters to get t[illegible]r of our reason; and Mr. Paget, who has published a [illegible]rk upon "Hungary and Transylvania," has had to st[illegible] adoption of the common story by proof drawn from [illegible] poet's own writings. "I know," says he, "that the [illegible]ve assigned Tomi, on the Black Sea, as the place of [illegible] it I feel fully persuaded that a part of his sufferings took place in this secluded valley on the banks of the Da[illegible] what other place so well answers to the description of [illegible] his plaint —

> "*Lassus in extremis jaceo popu*[illegible]*que*
> *Hcu quam Vienna est, ultima*[illegible]

Be this as it may, the Wallachian peasantry [illegible]fess still to retain amongst them memories of Ovid a[illegible]e Emperor Trajan, and say that, when the latter ma[illegible] against the Dacians, the Roman soldiers eagerly pressed [illegible]rd to visit the prison of the illustrious poet.

For the information of those of our readers [illegible] are not familiar with the Latin classics, we may mention that Ovid was a Roman knight, and was born at Sulmo in the year 83 B.C., and, like Moore, manifested even in boyhood his *penchant* for poetry. He was sent to Rome to receive his educ[illegible] at an early age. His residence in the gay capital into [illegible]nquered Greece had infused the love of art and s[illegible] gave a still further impulse to his poetic tastes; and [illegible] conformity with the requirements of a polite education a[illegible] age, he was sent to Athens, he soon added to the piquant [illegible]acy of the Greek rhetoricians the gloomy passion [illegible]fitness of Latin muse His father was anxious that he sh[illegible] devote all his attention to the cultivation of forensic eloquen[illegible] that he might shine in the great dissensions which were th[illegible] agitating the empire, and thus open to himself the path to fame and wealth But neither the prayers nor entreaties, nor the brilliant prospects held out to him, could cool in the young disciple the ardour of his first love.

Ovid continued to write poetry, and nothing else. His first efforts were happy and successful Augustus, who, like many other despots, wished to gloss over the despotism which he was establishing by his patronage of letters, invited him to court, and loaded him with favours. But it is seldom that [illegible]d fortune long attends genius and love, and Ovid fell a victim to the infatuation, which has proved fatal to so many. It was not enough that he should sing the praises of his inamorata, and so long this, reveal to the public gaze all the follies of a [illegible]ss and frivolous life; but he resolved upon reducing love-making to a system, and commenting upon and explaining the rules which should regulate it. He therefore published a poem entitled, *De Arte Amandi*, or the Art of Love, witty, brilliant, and sparkling in the highest degree, but famed for its immorality even in a licentious age.

He had previously in some way or other incurred the displeasure of Augustus, and the appearance of this poem furnished an excuse for banishing him from Italy. He was sent to Tomos, in Thrace, and there kept in confinement.

Nothing is known as to the real nature of his offence; but it is certain that it was not the *Ars Amoris* There have been various conjectures hazarded about it Some have said that while Ovid had enough of the courtly graces to win the favour of Julia the empress, he had not discretion enough to avoid drawing upon himself the suspicions of her husband. But it has also been said, and perhaps with greater truth, that Ovid had been an involuntary spectator of some of the scandalous enormities which then disgraced the palace, and that Augustus could no longer endure the presence of one who

is impossible to give in a translation the *touching* pathos of the l —"Wearied and wobegone, my lot is cast amongst far-off lands ungu people. Alas! how near I am to the end of the world!"

had been the witness of his own disgrace. It was in vain that the poet sought to disarm his anger, or move the pity of his successor Tiberius. The remainder of his days were spent in solitary exile on the banks of the Danube, where he died in A.D. 17, at the age of fifty-seven.

TOWER OF OVID.

triumph over the Turks. And there still is the great hall with its rude pavement and lofty vaulted roof, where the return of the knight victorious was celebrated with joyous banquets, while the walls around look grim with old weapons. And there is the boudoir in which the *chatelaine* embroidered

The castle of Arva, in former times the property of the Thuzzi family, is in the county of Thurvez, upon the banks of the river Oag. Everything about this old feudal stronghold

with her maids, and its latticed window from which she looked so often with throbbing heart waiting for news from the army; and there is the chamber of the seigneur, with portraits of all

CASTLE OF D'ARVA.

remains exactly as it was two hundred years ago. Once we pass the great gate we see nothing around us that does not belong to the fifteenth century. There is still the Gothic chapel, and the little oratory to which the lady often retired to implore God's protection for her husband, and pray for his

the great men of that great family mouldering on the dusty walls. All belong to a past age and another state of things, ere the unbought grace of life and cheap defence of nations had been displaced by the hireling agents of brutal despotism.

THE ROYAL FAMILY AT HOME.

PERHAPS some of our readers may have fancied occasionally that the domestic life of Windsor Castle or Buckingham Palace is one of state and grandeur—costly robes of richest velvet and ermine, jewels and proud looks, gold and silver, and cold formality. Now, we are not about to tell them that we have had the honour and felicity of being present at any royal *reunion*, much less that we have any real knowledge of the manner in which our beloved queen and her husband pass their time when not engaged in public matters. On such subjects they are probably as well informed as we; and know precisely when "the Queen and Prince Albert took their early walk on the slopes" or when the "Prince of Wales and the royal children took a drive in the Home Park." It is not, therefore, to be expected that we can increase their information

me ... to the mixed character of Englishmen as'd ... ing, lords, and commons; and, notwithstar ... advanced in favour of what is called pure d ... an institutions, we hold our faith and fea ... o mon ... and unshaken. THE ROYAL FAMILY AT HOME. AFTER THE PICTURE BY WINTERHALTER.

to any great extent as to the manners of the Royal Family at Home. On that subject the painter seems to have had greater opportunities than we. Let him speak. We may be allowed a word or two in connexion with the picture nevertheless. And in that which follows we beg that we may not be misunderstood.

From the days of the Norman Conqueror to those of his royal descendant, no monarch has been so entirely popular, so completely beloved by the people, as our most gracious queen, Victoria the First; nor, on the other hand, has any monarch deserved better of her people. We are not of those from whose pens flow the words of eulogy as readily as the will can write them, nor are we to be classed among the haters of royalty and the revilers of state, simply because it *is* state, and only because it *is* royalty. We believe that no form of government

time Victoria and Prince Albert are seen passing unattended through the crowd in the Crystal Palace; at another they are discovered among the looms of Manchester, looking with observant eyes upon the doings of the sons of labour. Now the prince is taking the lead in promoting the publication of working men's lectures; then the Queen is occupied in bestowing her patronage on an institution for the teaching of the young, or the harbouring of the old and weary — at all times doing good, and doing it unassumingly.

And so it has happened that the millions whom Victoria calls her people have come to regard her doings and sayings, and comings and goings, hither and thither, with peculiar interest; and that their affection for her person extends even to the Royal Family at Home.

FUNERAL CEREMONIES.—CHAPTER II.

By Xanthus.

The Japanese dispose of their dead either by interment or burning—a sick person generally fixing beforehand which he prefers. The rich keep the body twenty-four hours, but the poor only twelve; and the latter do not go into mourning, which the former wear for fifty days, during which time they stay at home, and, avoiding all ostentation, live on a spare diet of rice, fruit, and vegetables; they are also careful to shave their heads and cut their nails before attending an interment, as either act is forbidden during the fifty days' mourning. Their coffins are square or round tubs, in which the corpse is doubled up, or placed in a kneeling posture, and these dolorous receptacles are made secretly by the relatives of those advanced in life, that the wood may be well seasoned enough to take the varnish when ever death occurs; and when a person of quality is buried, the coffin is conveyed in a palanquin, preceded by attendants bearing flags, lanterns, and artificial flowers. It is first taken to the temple, and set down before the image of the god, whilst the priests chant hymns; and on an oblong tablet are inscribed the name of the departed and the day of his decease. Sweetmeats and fruits are placed before this tablet, and a box of burning incense—the eldest son, or the chief mourner, saying prayers beside it, followed by all the other mourners in succession. Bells, drums, and trumpets, are next sounded, the women and spectators now returning home, whilst the male relatives attend the body to the grave, which is distinguished by a flat stone and near to it a hut is erected, in which a servant is placed, who notes down the names of all friends who attend there to pray for the dead during a period of seven weeks, at the end of which time the chief mourner calls on all mentioned in the list to return thanks for the payment of this last tribute of respect. Another wooden tablet is set up in the abode of the deceased, and sweetmeats, fruit, and tea, placed before it, candles being lighted night and day, and the whole household pray before it, morning and evening, and the servant who sets victuals before it three times daily besides, offers up a prayer each time. Daily also a priest attends to read prayers to the household for seven weeks, and the son, or chief mourner, goes in his course mourning dress to pray by the grave every day, regardless of inclement weather, and wearing a rush hat over his face through which he can see without being recognised. These tablet services, with variations too tedious to mention and at gradually lengthening intervals, are continued to some extent as long as the family survives—a practice become less common amongst the Japanese than it used to be. When the body is burned, the youngest child present sets fire to the pile, and the calcined bones are collected in an urn, which is then buried.

The funeral ceremonies of the Chinese, in many respects, resemble the above. The term of mourning, during which a Chinese may perform no public function, is still observed for twenty-seven months, when they wear coarse sackcloth, and a cord to begin with, followed by a period when the coat, boots, and upper garments are made of white cotton, and this is succeeded by a third period, when silk vestments may be worn. The whole of a person's property is sometimes consumed in performing this funeral rites—a most childish procedure on the part of the natives of a celestial empire, and if a person dies too poor to admit of being interred with suitable magnificence, the body is kept sometimes for years, that it may at last be buried with due honour. Instead of keeping their preparation of a good coffin secret, like the natives of Japan, it is to the Chinese a matter of great interest during their life-time, and a son will occasionally sell himself as a slave to enable him to present his father with the acceptable gift of a handsome coffin. When death occurs, the universal Oriental custom of women howling is regularly observed, and the funeral processions are preceded by persons bearing pans of perfume and blue and white streamers, whilst much pains is taken to select an agreeable burying-ground, it being supposed that particularity in this respect consults the feelings of the dead. The Chinese cemeteries are commonly ornamented by cypresses, and while the coffins of the poor are merely housed under a thatched shed, those of the rich are placed in [illegible] like a horse-shoe, and tastefully [illegible] be a mandarin, a large white tablet is also placed before his vault, on which stand candlesticks, vases, censers, and figures of men and horses, cut out of paper, which it is believed will be useful to the defunct in another world.

We have spoken of the funeral customs of Russia, but that empire includes so many distinct nations, that we must find room for a brief description of the observances maintained by one of its numerous Tartar tribes, whose religion partakes of Oriental paganism, blended with some idea of a Supreme Being. This tribe of the Yakutes dress their dead in their best apparel, binding their arms straight down as far as the waist, and depositing them in very thick coffins, with a knife, flint, steel, tinder, and a supply of provender to support them on their journey to the region of spirits. Their funerals are superintended by a priest; and the favourite horse of the departed, together with a well fed mare, accompany the train of mourners to the place of burial. Two graves being dug, the horse is slain and interred in one, and the coffin placed in the other, the poor mare being slaughtered and dressed for the funeral banquet, and her skin hung up above the graves, over which the priest prays that demons will not injure the deceased, and the ceremonial is ended by filling up the graves, which are situated, if possible, under a tree. Most Yakutes, preferring to be interred in a wood, generally select the trees they like best whilst alive under which to be buried.

Amongst the Swiss cantons, Christianity is too far advanced to supply many details of funerals, since they are severally conducted according to their respective Protestant or Roman Catholic persuasions, much as they are in England, but their graves, at least in the Catholic districts, are more carefully kept. Flowers ever-fresh grow over them, and gilt crosses and other images are erected, whose inscriptions with portraits of the deceased, and other devices, are sedulously attended to by the survivors, who constantly visit and pray by the tombs of their beloved ones. In German Friburg the women wear a somewhat curious mourning garb, the lower portion of their countenances being hidden by a white cloth, and another closely covering their heads and falls down over their shoulders; to these white veils are added a jacket, petticoat, and apron, of black cloth, blue stockings, and buckles of prodigious size.

In Portugal an observance is maintained of admitting freely all acquaintances during the first eight days after death has taken place, and who attired in black, come in crowds to offer condolence to the real mourners, who are obliged to receive them, sitting in heartless state the observed of all careless observers and indifferent callers. The Portuguese always inter in their churches, and at night, and, like the Spaniards, they only use the coffin to convey the body to the grave, infants, whose parents cannot pay the expense of a funeral, are often exposed on the steps of the cathedral, a little cup being placed on their breast into which the charitable drop sufficient to induce the rapacious priests to take the trouble of burying them. A curious festival is annually commemorated in Thibet in honour of the departed. It takes place at night, and much rejoicing is occasioned by calm fair weather on these occasions, which are graced by extensive and brilliant illuminations of the monasteries, villages, and towns—the large lamps which burn in the open air shining effectively amongst the groves of willow-trees. The profound stillness of the night is solemnly broken in upon by slow regular tolling of the nowbut, trumpet, gong, and cymbal, bells also mingle their sonorous, melancholy tones with these musical instruments, and with the loud recitation of prayers, carried on by devout inhabitants and the priests. Alms are distributed to the poor extensively at this festival, and acts of benevolence are then considered to possess peculiar merit.

The funeral obsequies amongst Mahometan nations are generally much simpler than in Pagan or semi-civilised Christian countries. When a Mussulman is about to die, he is laid on his right side towards Mecca, in which posture he is also buried. A chafing dish with burning perfumes is brought into the apartment, and the imam of the mosque attends to read the 36th chapter of the Koran and confession of faith to the dying man. When all is over, a sabre is laid on the body, which is washed with aromatic substances, and the forehead, nose, hands, and feet, with camphor. It is then enclosed in a sheet, and four men carry the bier to the grave, followed by the male relatives, who maintain strict silence, and upon the pall is placed a piece of sacred silk from Mecca, the grave is filled up with earth and reeds to the height of a hand's breadth, in the shape of a camel back. It is not allowed to be covered with anything but turf and flowers, nor is it lawful to sit or walk upon it. The imam repeats a prayer, and calls the deceased thrice by his name, as that of his mother, or if that be unknown, the Virgin Mary, all returning in silence. Jews for men and that of Eve for women. The cemeteries are situated outside of towns, and planted with [illegible] and cypresses, and the graves on which myrtles are planted are tended with great care—those of the rich being occasionally decorated with marble columns erected at the head supporting a sculptured turban for men, and a vase for female, and sometimes open chests of marble are placed over a distinguished tomb, with a moral inscription, such as—"This world transient and perishable, to-day mine, to-morrow thine." Sultans are buried in superb sepulchral chapels, in which are lar

chandeliers with abundant tapers, pavements of marble, porcelain, and golden ornaments, lamps constantly burning, and four to six keepers, who continually recite chapters of the Koran for the repose of their souls.

The Persians inter their dead much in the same manner, only clusters of tombs are frequent, which have a curious effect. Those who can obtain burial, they say, close to a holy personage will be favoured by him at the day of resurrection. The Persians, however, do not pay the regard to their graves which the Turk do, and often use the stones which cover them as materials for building. They wear mourning of a pale brown colour for forty days, during which time they moan and sigh frequently, eating scarcely any food for the first eight days, and receiving visits of condolence, whilst the women rend their garments and water the grave with tears two or three times in each week

Our neighbours of the Emerald Isle still retain many ancient burial usages, and, on the death of a relative, a messenger summons all his friends, who assemble at the house of the deceased. On the arrival of the first detachment the keena is raised—a loud mournful wailing, said to exert great effect when given by a female who possesses a very musical voice, this ceremony over, pipes, whisky, and tobacco, are handed round, and conversation goes on concerning the event, and many other topics, but when a fresh arrival takes place, the wild mournful keena is again raised, and is repeated at intervals all day with clapping of hands, done to mark the time during the howl Towards midnight the young men adjourn to a barn or out-house, and the games are played with great spirit between candidates of the rival parishes. These games are still known by the old names of hot-loof, sitting and standing bogue, trimsy tramsy, &c If the deceased bear a high character in the neighbourhood, the wake is conducted with quiet respect, and the games with as little noise as may be, and the body is laid out on a board covered with a fine white sheet, while large wax mould candles are lighted all round it If the face be left exposed, and the corpse be waked on the bed, crosses and flowers are stuck up above and around it, the rest of the furniture being removed from the chamber, in order to leave room for plenty of seats for the company, before whom the best of eating and drinking that the family can afford is placed with Irish warmth of prodigality and hospitality. The Irish, too, frequently visit the graves of the departed, saying prayers by the crosses placed at their heads, planting the prettiest wild-flowers on the turfy heaps, and sometimes suspending white chaplets, cut out of the best writing paper, over the remains of their loved ones

We have spoken of the joyful manner in which the death of an infant is celebrated in Spain A similar feeling seems to prevail in Paraguay, and when a young child expires in that far off country, if of high rank, a large party assemble at its father's house, as if to celebrate some happy festival, while music, singing, and supper, proceed in the brilliant routine of an evening party in England The small coffin is placed on a kind of throne at one end of the drawing-room, richly adorned with artificial flowers, and huge wax-lights in great numbers stand round it, blazing in gilded candlesticks of carved wood, and of enormous size, while over the head of the coffin is hung a silver image of our Saviour, looking down upon the tiny body, which is dressed in its gayest apparel Noisy joyful music precedes the corpse when, on the next day, it is taken to the cemetery, followed by priests, and the child's godfather bearing an enormous wax candle four feet long, and a jesting troop of friends, servants, and relations, who, when the coffin is deposited in the ground, return to the house of mourning, there to renew the same mockery of rejoicing and feasting.

With a brief account of the funeral rites of the North American Indians, we must now conclude a paper already too long, though its subject is by no means exhausted When a Red Indian dies, the body is decked in its best clothing after oiling, feasting, and being supplied with bow and arrows, tobacco knife, flint and steel, and provisions, to support the deceased until he reaches the land of spirits, soft skins are then wrapt around it, and so fastened with thongs as to exclude all air. It is next placed on a light scaffold above the height of man, its face carefully presented towards the rising sun. Many of these frail scaffolds may be seen near a wigwam village, the bodies of chiefs distinguished by coverings of scarlet or blue cloth. Catlin says that not a day of the year passes on which Indians may not be seen prostrated near these erections tearing their hair, weeping bitterly, and uttering piteous lamentations. When the scaffolds decay, the bones are buried by the nearest relatives of the departed, and the skull is placed on a bunch of freshly gathered sage (kept constantly renewed), and is then placed in a Golgotha or circle, where are hundreds of other skulls, each preserving a space of eight or nine inches between; and in the centre of these circles is a small raised mound, supporting two buffalo skulls and many other curious and mysterious symbols, which are believed to possess the power of protecting the Golgothas intact. Here, too, the survivors attend almost daily, talking in tones of fond endearment to the skull they love most, and which is distinguished by a mark; and here they bring dishes of their choicest food freshly cooked, which they set before the skull, and return for the dish the following morning. Here, too, Catlin tells us, "it is not unfrequently the case that the woman brings her needlework with her, spending the greater part of the day sitting by the side of the skull of her child, chatting incessantly with it, while she is embroidering a pair of mocassins; and perhaps overcome with fatigue, falls asleep with her arms encircled round it, forgetting herself for hours."

SIR SAMUEL ROMILLY ON THE CRIMINAL CODE.

ONE of the first and most beneficial consequences of the release of the national energies from the absorption of war—as Mr Washington Wilks in his "History of the Half Century"—was seen the number of attempts at the amendment of the laws and the amelioration of the social condition. Foremost amongst these were Sir Samuel Romilly's enlightened and benevolent labours for the mitigation of penal services The first success of that eminent lawyer and philanthropist, though not often remembered, yet unquestionably exhibited a most striking and great effect—was in 1808, when he carried a bill abolishing the punishment of death for stealing from the person to the value of 5s. Pursuing the plan he had laid down for his guidance—that of attempting the removal of these disgraceful statutes one by one, rather than the establishment of any general principal of penal law—he brought in three bills in 1810 Stealing from a shop to the value of 5s, from a house or ship to the value of 10s were capital offences; and against this frightful barbarity his three bills were directed. The first was carried in the Commons, but lost in the Lords; the second and third [illegible] their introduction. But in the next session they were [illegible] applying to the capital offence of stealing [illegible] which first was carried In 1813, the new House [illegible] bill relating to shop lifting, but it was [illegible] by the Lords. Romilly rested awhile, weary [illegible] unsuccessful species. In 1816, he revived his attempts [illegible] punishing shoplifting with death, which he justly regarded as the worst of the sanguinary code He combated the plea of necessary severity, so often and successfully urged against him, with the fact, that juries now constantly refused to convict, and consequently that the crime increased, especially among children, a boy not ten years of age then lying in Newgate under sentence of death for this offence These arguments prevailed with the Commons, but the Lords were still swayed by the vague fear of endangering property, which the Lord Chancellor and the Lord Chief Justice evoked. In 1817, it was not likely any diminution from the terrors of the law would be permitted, and in the year at which we have arrived, success in the Commons was obtained only to be again annulled by the peers There is no more striking indication of the advance we have made upon the habits of our fathers than this—that whereas life is now taken only for life, and a growing feeling is in the country against even that exaction of supposed equivalents—Romilly—a man of great personal and political influence, at the head of his profession, eminent for eloquence and legal skill—spent his best years, from 1808 to 1818, [illegible] the legislature to exempt petty thieves from [illegible] prevailed only in taking pocket watches and [illegible] in the long list of articles to purloin which was [illegible] too, another instance of the anticipation of legislative by public opinion. It was not till one institution of the country set itself in opposition to another, that juries rendered bad laws inoperative by pious frauds, and prosecutors preferred to convict at theft rather than to be parties to judicial murder, that those laws were ameliorated. The understanding and the morals of the legislating class were too fitly represented by a circumstance related by Romilly —"While I was standing at the bar of the House of Commons a young man, the brother of a peer, came up to me, and breathing in my face the nauseous fumes of his undigested debauch, stammered out, 'I am against your bill, I am for hanging all.' I was confounded, and endeavouring to find out some excuse for him, I observed that 'I suppose that he meant that the certainty of punishment affording the only prospect of suppressing crime, the laws whatever they were, ought to be executed.' 'No, no,' he said, 'it is not that There is no good done by mercy; they only get worse. I would hang them all up at once.'" It was upon such material as this that the Eldons and Ellenboroughs of the age stamped the impress of their fallacious logic and of a barbarous antiquity.

THE IRON-MAKING RESOURCES OF THE UNITED KINGDOM.*

However successful the Exhibition of 1851 may have been, regarded as subserving the great purpose for which it was designed—namely, to illustrate the progress made up to the present time in the various departments of the arts and manufactures of the world; and, however wonderful the vast collection of objects of wealth and industry with the skill and science of modern civilisation then brought together, it may certainly be asserted that the Exhibition itself displayed in no one of its details any more remarkable instance of modern progress than the vast and stately building which rose with almost magic rapidity from the ground, and which was no less admirable for its beauty and simplicity than for its amazing vastness, and its perfect adaptation to the purposes for which it was intended. The very conception of the idea, and the successful execution, of the Crystal Palace, brings prominently forward the great Iron-making resources of the kingdom, and the extraordinary degree of perfection to which some of the branches of our iron manufactures have attained Whilst the other branches of manufactures have been illustrated by a careful selection of the most perfect results attained in their own departments, the most remarkable illustration of the present condition of the iron manufacture is to be found in the building itself, which spread its lofty roof and walls of light over all it held, and guarded with such perfect care and fitness the boundless stores of wealth collected together from so many parts of the world. The guardian and basis of the Exhibition itself—the Crystal Palace—illustrates no less admirably how the iron-making resources of the kingdom underlie all departments of manufacture and become the very foundation on which all modern progress must rest, aiding and assisting every other branch of manufactures, and connecting all together in one great bond of unity It is natural, therefore, that a prominent place should have been assigned in the Exhibition to the iron-making resources of the kingdom, and it was wisely determined that an attempt should be made to collect, in the mineral department, so comprehensive a collection of the various iron ores of Great Britain as should enable the people to form some idea of our general iron-making resources. No similar attempt had been made before, and, consequently, this was one of some difficulty, and the execution could only be considered approximately successful.

It will be necessary, therefore, in the first place, to take of the rise and progress of our iron manufacture, in order to give an idea of its rapidity during the last half-century, Its history may be divided into two periods—the first extending from the earliest historical notice of it which we possess down to the introduction of coal as fuel for smelting, and the second extending from that period to the present time England was early celebrated for her iron manufacture, and there are few districts where iron ores are now found in which remains of old workings do not exist, and in some districts it is clear that smelting with the charcoal of the forests was extensively carried on This was the case not only in the districts where iron manufacture is now worked, but in those in which it has long ceased, and the red hæmatites of the carboniferous limestones of Lancashire, the Forest of Dean, and Somersetshire, the argillaceous limestones of Derbyshire, Yorkshire, Staffordshire, and South Wales—all now great iron-making localities—were worked at very early periods, while the iron ores of the green sand and wealden clay formations of Sussex, Surrey, and Kent, and the hæmatites of the Devonian beds of Somersetshire, and even the hæmatitic conglomerates of Brockwell and Minehead, which have now ceased to be iron-producing districts, were formerly largely worked. Traces of ancient workings have also been found in the ore districts of Northamptonshire, which have only attracted attention since the exhibition, which show they were known to the Romans. The early iron trade was at its greatest height in 1615, where, according to "Sturtevant," as quoted by Dudley in his "Metallum Martes," there were in England, Scotland, Ireland, and Wales, eight hundred furnaces, which, if worked 40 weeks a year, would produce 180,000 tons Various causes led to a decline in the manufacture, and in 1740 it was only 17,350 tons, produced by 59 furnaces. Attempts to employ coal for smelting were made in 1620, but its use for fuel was only established in 1740, the second epoch in the manufacture of iron, which in 1788 rose to 70,000 tons; in 1800, to 180,000, in 1825, to 600,000; and in 1851, to 2,500,000 South Wales producing 750,000; Scotland, 775,000, South Staffordshire and Worcestershire, 600,000; and other districts, 400,000. In 1851 the exports were upwards of 1,200,000 tons, not including tin plates, hardware, cutlery, and machinery, the declared value of which was—tin plates, £1,018,951; hardware and cutlery, £2,926,132; machinery, £1,164,933; and adding to this pig iron, bars, wrought iron, wire and castings, the whole value of the exports of iron was £10,424,139. The causes of this increase are traceable to the demand made by the rapid expansion of all our arts and manufactures, to improve machinery and apparatus, and to the vast and almost inexhaustible supplies of coals and iron our mineral fields contain. As regards the two first, this country only possesses them in common with the world at large, but as regards the last, it possesses a marked pre-eminence, the United States alone being able to bear any comparison as regards the area of coal and iron fields, but possessing no argillaceous ironstone, which exists in this country in such abundance, alternating with beds of coal in our coal-fields, so that coal and ore are constantly obtained together by the same working. This proximity exists in no other country; and in the Exhibition there were four hundred specimens of the argillaceous ironstones of England, while the only other country that possessed any specimens was the United States and those amounted only to three or four. Besides the argillaceous ironstone, there are carbonaceous deposits of iron ore peculiar to this country, and the "blackband" ironstones of Scotland, Northumberland, North Staffordshire, and South Wales, are unknown elsewhere, and these supply nine-tenths of the iron produced The quantity of iron produced is—in Scotland, 775,000 tons, South Wales, 700,000, South Staffordshire and Worcestershire, 600,000, Shropshire, 90,000, North Staffordshire, 55,000, Yorkshire and Derbyshire, 105,000, North Wales, 28,000, Forest of Dean, 26,000, Whitehaven, 12,500; Northumberland, 90,000 The ironstones are divided into the argillaceous ironstones and the blackbands or carbonaceous ironstones. The former consists of oxide of iron, alumnia, silica, manganese, soda, potash, phosphoric acid, titanium, crystals of nickel, zinc, copper, and lead, the quality varying according to the predominance of any of these components The cost of raising this class of ores is greater than any other, being from 4s to 9s. a ton, but from their superior quality and proximity to coal, they are extensively used. The second class, the blackband or carbonaceous ironstones, are not so varied, and owing to their general thickness, are raised at 1s 6d to 2s a ton The two principal constituents of blackbands are oxide of iron and carbonic acid, silica, and alumnia existing only in a small proportion, The iron they produced has a greater tendency to "cold-shortness" than any other class, owing to the phosphoric acid it contains, and are best adapted for foundry purposes, for which indeed Scotland is pre-eminent The localities in which it exists are Scotland, Northumberland, North and South Wales, North Staffordshire, parts of South Staffordshire and the Clee Hills The discovery of "Blackbands" in Scotland was made in 1801 by Mr. Muskett, and the power of using it in blast furnaces by means of the hot blast was a new era in iron manufacture, causing an increase in Scotland from 37,500 tons in 1830, and 196,960 in 1839 to 750,000 in 1851. The next most important blackband districts are North Staffordshire and South Wales—the Llynvi Valley bed being the most remarkable—and in the Anthracite district, of Ystabyfera and Groscedwin, as well as in those of Pont-y-Pool, Nant-y-glo Ebba Vale and Sirhowy blackbands are to be found, as well as in the Cardiff vales, in North Wales, and the Clee Hills, and also in the lower carboniferous beds of Northumberland and Durham In some districts beds of coal sometimes change into beds of blackband ironstone, and the extent of deposits of ironstone alternately with beds of coal may be gathered from the fact that the entire area of the coal-fields of England, Wales, and Scotland, is estimated at 5,768 square miles; although in some of the coal fields the argillaceous ironstone do not exist in quantities sufficient to enable them to be worked, yet they are part of our iron manufacturing resources, since that fuel is required for smelting the carboniferous oolitic beds The most important iron ores, after the coal-measures, are the hæmatites or red oxides, which are found in carboniferous limestone formations, the most important deposits of which are in Lancashire and the Forest of Dean. This class has been worked at an early period, and, though not rich as a class, is, from its large masses, produced at a low cost of 2s. or 3s a ton Some of the hæmatites in the northern districts are considered the finest quality in the kingdom, and are largely shipped, while the large percentage of iron they contain, 60 to 65 per cent, render them of great importance. This ore is found also in Scotland, Somersetshire, Devon, and the Isle of Man, but has been worked only to a limited extent. There is also a valuable class of these ores, the "Brown Hæmatites" of Durham, similar to those used in Belgium, which is little used, owing to the deficiency of means of transport. This country is by no means rich in the micaceous iron-ores of the northern countries of Europe and the United States which are considered the finest class of iron ore known, although some of them exist to a small extent in Dartmoor and other parts of Devon. Of pure white carbonate, the Sparme

* The substance of a lecture delivered at a meeting of the Society of Arts, by S. H. Blackwell, Esq., F G S, of Dudley, Worcestershire, forming one of a series of discourses in connexion with the Great Industrial Exhibition of 1851.

iron of the German mineralogist, no specimen was exhibited in the Exhibition, but it has since been found to exist in West Somersetshire.

The next class of ores, the discovery of which marked a new epoch in the iron trade, and which have occurred simultaneously with the development of facilities of transport by railway, are those which occupy a position at the base of the oolitic formation, which commence on the east coast of this island from the south bank of the river Tees to Scarborough, stretching through Yorkshire, Lincolnshire, Rutlandshire, Northamptonshire, Oxfordshire, and Dorsetshire to Lyme Regis, where being turned aside by the granite formations of Devon, it is prolonged into France. It was first worked at Middlesborough in the north, where two or three years ago deposit of iron was discovered by a workman, and the bed of which was found to be 15 feet thick, and to contain 30 per cent. of iron, and could be raised at a less cost than the blackbands of Scotland. Its character is peculiar, being in parts of a greenish blue colour, and in others of a brownish tinge, and, from its peculiar qualities, it can be produced at 3s. to 3s. 6d. a ton. The existence of this oolitic formation in Northamptonshire, has been long known; but it was only till after the Exhibition that its real value has been ascertained. The supply of this ironstone for all practical purposes will be inexhaustible for a long series of years, and is found to be most valuable for mixing with the argillaceous stones of South Staffordshire, which cannot otherwise have long maintained its manufacture of pig iron.

The first great improvement in the manufacture of iron, and the base of all subsequent advance, was the smelting of iron by coal, which was known in 1620, but not fully applied till 1740 The weekly production of iron from the first coke furnaces was only 10 or 12 tons, in 1788 it was 17 to 18, in 1796 30 tons per furnace, in 1825 it was 42 tons per furnace, and in 1851 the average weekly produce was upwards of 100 tons per furnace In South Wales, Scotland, and South Staffordshire, there are furnaces capable of producing 200 tons per week. Thus, in little more than a century, the improvements have been so great, that two furnaces now produce a larger quantity of iron than the entire furnaces in blast in 1740, whilst the general iron trade has so extended itself, that now several single firms produce from four to five fold the entire make of the kingdom in 1740. This increase during the last twenty-five years is owing to the system of heating the blast previously to its being forced into the furnace, which was first introduced in Scotland, raising the quantity of iron made there from 20,000 tons in 1820, to 200,000 in 1839, or to 775,000 in the twelve following years, and it was gradually introduced all over England.

The next improvement was the application of waste gases to raising steam and heating the blast The result of these improvements on prices and increased supply have been very great From 1803 to 1820, pig iron averaged from £7 to £9 a ton, being protected by a duty of £6 10s. on foreign pig iron. In 1825, this duty was reduced to £1 10s. From 1825 to 1847 the price fluctuated from £2 17s. 6d. to £7 per ton, and from that year to the present it has ranged from £3 10s to £2 12s. 6d Every reduction of price has been followed by increased demand, and the removal of protection has led to greater attention, both to economy of production and the quality of iron, which has to compete with foreign iron, and the result has been a gradual lessening of the demand for expensive foreign iron, from which steel was formerly universally made, and thus extending most materially the hardware and cutlery trades of this kingdom

Not fewer than 650,000 to 700,000 persons are employed in the various branches of the iron trade, who are all well paid, and are as a class intelligent, though from the nature of their occupation less cultivated than it is hoped they will soon be

It is impossible not to be struck with the vast and almost inexhaustible supplies of iron which we possess, and with the wonderful fact that the extraordinary demand which railways and other requirements have produced should have led, not to an increased price, but to the constant discovery of new and cheaper sources of supply. In this respect the iron trade illustrates most strikingly what appears to be a general law—that the natural resources of the world are invariably developed at the times when the progress of society most require them, and when that progress is already such as to enable us to avail ourselves to the greatest advantage of new discoveries. Thus with the iron manufacture; at first the stores of fuel which our forests contained, and the iron ores which cropped out at the surface of the ground, were amply sufficient for our purposes; then came the knowledge of the power of smelting ith coal, and with this knowledge the steam-engine placed in our hands the vast stores of mineral fuel of our coal-fields The modern system of railways next produced a demand for iron of an unprecedented character; and simultaneously with this demand occurred the introduction of the hot blast and the use of the black bands of Scotland. The more intimate connexion of the old and the new world by means of transatlantic steamers, is followed by the discovery of Californian and Australian gold; giving to the commercial and civilised world at large an activity and a movement such as it has never before withessed—causing streams of population to flow in unprecedented numbers from the older countries of Europe to comparatively new regions, and bidding fair to make the vast and magnificent countries of Central America and Australia the seats of great and important empires.

And these populations—not isolated as the colonists of old, not struggling with long periods of poverty and slow growth, but springing up rapidly into flourishing communities—all take with them into their new homes the social wants and requirements of the older countries which they have left. Iron steamers will be required to continue their connexion with those countries, and to carry on the extensive commerce they will originate; new lines of railroad will be necessitated, not from towns to towns, but from state to state, and even from ocean to ocean. And not only in America are these mighty movements at work, but elsewhere also. In India, with its 180,000,000 of population, railroads must be laid down, the government of that country cannot be held without them, its natural resources cannot be developed without them; the rapidly-extending requirements of our cotton manufacture will necessitate them; and every line of railway that is laid down will lead to the demand for ever-increasing quantities of iron; and even in our own country the sanitary measures to which such attention is now being directed, will require an extremely large and increasing supply of iron, both for an abundant supply of water to the dense populations of our manufacturing districts, and also for purposes of building, which the rapidly-increasing prosperity of our working classes will no longer permit to be overlooked as in the past.

If the increase during the last twenty-five years has been so great—from 600,000 tons to 2,500,000—there is every reason to expect an equal increase during the next twenty-five years, as the general requirements of society must develop themselves in an equal (if not in an accelerating) ratio; and how to supply these requirements another great source of iron is disclosed to us; to the argillaceous and blackband ironstones of our coal fields, and the hæmatites of our carboniferous limestones are added the oolitic ores, with the rich percentage of iron they contain, and the low cost at which they can be raised, and their exhaustless supplies. Can this constant progression of means—this constant development of one resource after another—as society requires it, be other than a wise and most beneficent arrangement, which has for its purpose the advancement of society to an even higher and higher point, and the attainment of that amity among all the nations of the earth which must ultimately prevail Nor does it appear a less wise and beneficent arrangement that these stores of mineral wealth so needful for the world's progress should exist in climates temperate as our own, which has produced the strong and vigorous Anglo-Saxon race to whom work is less a toil than a passion, amongst whom there are so many who do not shrink to devote even their entire lives to the development and execution of some great enterprise. But if the Anglo-Saxon race has been given so large a proportion of the mineral riches of the world, it must not be forgotten that equal to the power thus committed to their care is the responsibility thereto attached, and they must of necessity be the guiders and promoters of the advancing civilisation of the present, seeing that the very basis of that civilisation is to be found in the increased and increasing power to adapt to the requirements or society the great physical resources of the world, and that the science and skill of the present day would be comparatively powerless, but for the stores of iron and coal by which that science and that skill can be rendered available. The steam-engine, the railroad, and the electric telegraph, the characteristic features of the present day, are indeed preparing a quiet revolution for the world, breaking down class interests and substituting universal interests in their place, they are fast uniting in one bond of unity the entire human race, and are leading rapidly, to use the words of his Royal Highness Prince Albert, "to the accomplishment of that end to which indeed all history points, the realisation of the unity of mankind." For ourselves, it should not be sufficient that in the hands of a higher power than our own, we are unconsciously working out the designs of Providence, but we should strive to discern the coming changes which are arising around us; that thus conscious whereunto our work is tending, we may be enabled to place ourselves in harmony therewith That we have earnest workers amongst us, men working with noble aims, with no party, or mainly national spirit, but in the great cause of humanity itself, the Exhibition of 1851 has clearly shown. May its promoters long be remembered with honour, and may the important benefits which it already appears to have conferred upon all our principal trades, be productive of the results for which its promoters so nobly worked!

EXTRACTS FROM NEW BOOKS.

[Under this head we shall from time to time make such selection from the literature of the day as will keep our readers well informed as to the merits of the Books of the Season.]

PUBLIC BULL-FIGHT AT MADRID.—The Plaza de Toros stands immediately outside of the gate of Alcala. It holds fourteen thousand people, and during summer always fills, indeed, the tickets then are generally at a premium. I was surprised to find that on a Monday, being the bull-fight day, the cab-drivers raise their fares, having so many demands to satisfy. I walked slowly up the Calle del Alcala, watching the excited populace, and at half-past three o'clock found myself seated on one of the upper benches, looking down on the vast amphitheatre and the motley company there assembled. The boxes resemble balconies, those of private parties being partitioned off from the space allotted to the rich public. Below them are wooden forms, also protected from wind and rain, while the crowd occupy stone seats around the ring, uncovered, but protected from the arena first by a circular walk, and then by a palisade six feet high. A stone step surrounds this palisade on the inside to enable the chulos, who assail the bull with flags, to leap out of his way when he turns to attack them. From the windows of the passage, behind the boxes, you obtain a fine view of Madrid and the Guadarama hills. A strong guard of soldiers attends every bull-fight, for the spectators sometimes become mischievous, and their rulers think that rows may end in revolution. Government owns the Plaza de Toros at Madrid and saves the net proceeds to the charities. Before the performance commenced, the crowd of cloaked figures below became very noisy, and every now and then a sombrero was tossed into the arena to raise a laugh at the expense of its owner. Soon after half-past three o'clock a trumpet-call of martial echoed through the amphitheatre, then sounded the trumpets and drums, and the actors entered to exhibit their dress and how to the director, who sat in his elevated seat near the box of royalty. First came the matadors and chulos on foot, all richly dressed in particoloured garments and jackets of short tunic. The province of the former is to end each act by stabbing the bull in a certain part with a two-edged sword, while the animal tries to toss a bright red flag which they hold in the left hand. The latter run until the first twilight of other colours, to excite his ire and make him rush more furiously to the conflict. The picadors followed on horseback, each being armed, wearing armour under their clothes to protect them when unseated from the horns of the bull. Behind them also rode with fantastic trappings entered two teams of three mules each, which during the course of the arena when all is over. This ceremony being ended the combatants dispersed, the trumpets sounded again, and in rushed an animated brown bull, unhorsing one picador in the wild career and in a moment afterwards hurling another horse and rider to the earth. Without pause he charged, and again his assailant rolled in the sand, but he could not kept him, with their flags long at bay on the back of the fallen man. His fourth charge proved more successful to his long entering the poor horse's belly, caused instantaneous death. A little time the bull assaulted a picador, and his unfortunate steed shared the same fate. Again and again the brute returned to gore the mangled body, from which flowed torrents of blood. This amusement he seemed to relish for the chulos could not for a long time tempt him from the spot but the audience loudly expressed their disapprobation by shouting "Cavallo," in which most lustily I joined. Then the drum sounded the picadors retired, and the chulos, advancing to the bull, adroitly stuck into his neck barbed rods, called banderillas, in order to render him more furious. Then came the matador with his bright red flag and sword, and plunged the latter up to the hilt in the animal. But he had missed his aim, and another sword had to be procured. A second time he stabbed him, and then proved more successful, for the bull instantly fell, the spectators cheered the military band struck up a lively tune, and the mules were driven in at full speed into the arena to drag out the carcasses. As soon as these were removed, a large black and white bull rushed madly into the ring, bellowing with fury. His first exploit was to drag out the entrails of a horse, which, throwing its rider, galloped in this maimed state several times round the arena, till caught by a spectator who leaped the palisade. Six times did another picador charge this combatant, and four times he and his steed parted company, but they rose again to renew the conflict. The sixth encounter proved fatal to the horse, and only a few minutes elapsed before two other chargers also breathed their last. The third bull showed evident symptoms of cowardice. He fled from the picadors and refused to charge. So the chulos ran for squibs, and stuck them into his neck, which rendered him furious enough. The matador, whose duty it was to slay the animal, missed his stroke several times, the audience each time raised a louder and louder yell, hearing which the poor man seemed to tremble from head to foot, at length the bull crouched down from exhaustion, and a chulo despatched him with a dagger. The fourth bull was soon killed. The fifth animal, a huge black one, charged the first picador he saw, hurled him to the ground, and leaping over his prostrate enemies, bounded madly away. But his ardour speedily cooled, and he refused to face the foe. Just as the drum sounded for the matador to despatch him, I left the circus, for it began to get both dark and cold, but not a single person out of the 9,000 present departed before me, although, perhaps, all of them had seen the same spectacle hundreds of times previously. Men, women, and little children seemed quite absorbed with the contests, and expressed their interest by constant shouts, especially of applause, when some poor worn-out horse, gored by the infuriated animal, bit the dust. Although the mangling of horses is a spectacle repulsive to every humane mind, yet this great national amusement was neither so disgusting nor so exciting as I expected. Instead of prancing high-mettled Castilian steeds, eager to encounter an enemy, you find in the ring emaciated and broken-kneed old horses, the worn out hacks no longer useful to the cab-drivers, so terrified that their riders can with the greatest difficulty induce them to face the bull, and so feeble that they die almost without a struggle. The most horrible scenes occur when the horns of the beast drag out their entrails, or enter often into their bodies without touching a vital part. I saw one white charger which had been gored so frequently that a spectator would have imagined him painted red. He had three legs out of four broken, but notwithstanding, when I left my box, his rider had not dismounted. As to the interest caused by the conflict, I do not see how any one can feel it to be so great as that felt in a good horse-race, or a spirited run with the fox-hounds. There is no uncertainty no doubt, as to the result, the bull must kill the horse, and the matador must kill the bull.—*Bull's Sc "Bull and the Tiber."*

STRANGE APPETITES.—My old friend, Mr. Judd, Surgeon-Major of the Scotch Fusileer Guards, was once sent for to relieve a man who was said to have eaten a hat, on his arrival, he found a young man a soldier exceedingly ill, and in great pain. Mr. J., not believing the hat story, sent to the landlord of the public house, where the feat was confessed by the whole staff of the establishment that the patient had actually eaten a hat (of course cut into pieces) for gold! Under suitable treatment the consumer recovered, but not immediately.—In the Museum of the College of Surgeons, is a large bottle full of needles weighing nine ounces, may more than a pound, which were swallowed by a woman who could not have been in her senses, she lived many months after making her appearance, and instead of being committed got fat. Needles are very digestible, not recommended as an article of diet, for the *wo* ... *of you who* ... and not *proof who.*—*The Stomach and its Diseases, by ... Jones.*

NAPOLEON'S MODE OF LIFE AT ELBA.—In a few days the Emperor expected to be in possession of his future abode was established, with his household his guard, and his sister Pauline, in the buildings of the ancient church and in the principal house of the town. He hastened to order such erections and improvements to be made, as might conduce to the comfort of himself or his court, together with barracks for his 1,500 troops. He armed and reviewed the militia of the island, an animated room with some degree of military patriotism, as if he still aspired to keep up the game of sovereignty and love of country. He assumed the habits and surrounded himself with all the luxuries of a French palace, having to all appearance, only changed his seat of Government. This might have been, perhaps, from a desire to disarm the suspicions of Europe, from the very outset, by assuming the aspect of a puppy not much easily gratified by such trifles, or he might have felt sadly and not caring himself to preserve, without derision, the etiquette and vanity of a great empire on a desert rock of the Mediterranean, or he might have been acting in conformity with his somewhat theatrical character, the comedy of power and royalty to the audience of his own followers and the continent of Europe. The autumn of 1814 and the whole winter were passed in this manner by Napoleon, luxuriating with simplicity, and festivity with retirement in his residence. The work of his immense fortune and the first instalments of the allowance secured to him by treaty appeared to have been devoted by him to the embellishment of the island and to the acquisition of a small fleet, destined, as he alleged, to the commercial and military service of his new subjects. To this flotilla he had given a flag as to a navy power intended to maintain a position, and to make itself recognised and respected in the waters of the Mediterranean. Works of art, fugitive books, and the journals of Europe arrived for him incessantly from Genoa, Leghorn, and Paris. The eyes of the world were upon the little island. English travellers, with whom curiosity is one of the passions which neither distance nor national shyness can prevent the gratification of, flocked from London, from Rome, from Naples, and from Tuscany to gaze upon the man whose hatred had so long made them island tremble [?] and imprisoned England within the limits of its ocean. Neither upon the shores of Greece, of Asia, or of Italy could they find any monument or any ruin so imposing as this Prometheus of the West. They gloried in only having caught a glimpse of him, and in their correspondence and their journals they boasted of a word or gesture by which the hero, within his circle, might have repaid the importunate adulation. London and Paris resounded with the lightest step and the most trifling word of Napoleon, who, on his part, affected to receive the travellers with ease and grace, as one who had laid aside all arms and conquered all hatred, and who demanded nothing more

this world than an asylum, in every heart, a favourable souvenir in all imaginations. Pauline Borghese, the most beautiful and most favoured sister of her time, had transferred her court and attracted her admirers to the island of Elba. She adorned the exile of her brother, gave life and soul to it, impassioned it with her charms, and made it touching by her fidelity to misfortune. She constituted the splendour and the grace while she did the honour of his saloons. Concealing thus, under the guise of pleasure and of trivial occupations, a more serious and political devotion, she travelled, under the pretext of visiting her sisters and brothers, from Elba to Rome and Naples, and from Rome and Naples to Elba, an ambassadress without seeming importance, and free from suspicion, whose very volatility shielded her in the eyes of the continent from all imputation of sinister intentions.—*Lamartine's History of the Restoration of Monarchy in France.*

ANALYSIS OF OUR PRESENT LANGUAGE.—We might almost reconstruct our history, so far as it turned upon the Norman conquest, by an analysis of our present language, a mustering of its words in groups, and a close observation of the nature and character of those which the two races have severally contributed to it. Thus we should confidently conclude that the Norman was the ruling race, from the noticeable fact that all the words of dignity, state, honour, and pre-eminence (with one remarkable exception) descend to us from them—sovereign, sceptre, throne, realm, royalty, homage, prince, duke, count (Earl, indeed, is Scandinavian, though he must borrow his "countess" from the Norman), chancellor, treasurer, palace, castle, hall, dome, and a multitude more. At the same time, even did we know nothing of the actual fact, aspect, and chief occupation of this ruling race, came in not upon a new, but upon a long-settled country, a former dynasty, and a people to be in the rightful line of its succession; that [illegible] of the nation had not, in fact, more than many, been entirely broken, but survived in due time to assert itself and to disengage, almost unchanged, as Norman throughout. And yet while the stately supernatural of the hall, all articles of luxury, all that has to do with the chase, with chivalry, with personal adornment, is Norman throughout, with the broad basis of the language and therefore of the literature, the great features of nature, the sun, the moon, the stars, the earth, the water, the fire, and the primeval relations of father, mother, husband, wife, son, daughter, these are Saxon. The palace and the castle may have come to us from the Norman, but to the Saxon we owe far dearer names, the home, the hearth, the house, the roof, the "board," and often probably it was so in fact, but more frequently found than the other "table." His sturdy aim to be the soul of the boor, the hind, the churl, or the Norman put him to a name for him, it is one which on his lips became more and more a tall of opprobrium and contempt, the villain. The instrument used in cultivating the earth, the flail, plough, sickle, spade, are expressed in his language, so too the main products of the earth, as wheat, rye, oats, beans, barley, and no less the names of domestic animals. Concerning beef, last, it is not a little characteristic to observe, and Walter Scott has noted the observation into the mouth of the Saxon swineherd in *Ivanhoe*, that the names of almost all so long as they are alive are Saxon; but when dressed and prepared for food become Norman. Calf, which we might have expected beforehand, for the Saxon had the charge and labour of tending and feeding them, but only, that they might appear on the table of his Norman lord. Thus ox, steer, cow, are Saxon, but beef Norman, calf is Saxon, but veal Norman, sheep is Saxon, but mutton Norman, so it is severally with swine and pork, deer and venison, fowl and pullet, Bacon, the only flesh which may ever have come within his reach, is the single exception. Putting all this together, with much more of the same kind which might be produced, but has only been indicated here, we should certainly gather, that while there are manifest tokens as preserved in our language of the Saxon having been for a season an inferior and even an oppressed race, the stable elements of Saxon life, however overlaid for a while, had still made good their claim to be the solid groundwork of the after nation as of the after language, and to the justice of this conclusion all other historic records, and the present social condition of England, consent in bearing testimony.—*From the Study of Words, by R. C. French, B.D.*

THE DEATH OF BLAKE.—The crowning act of a virtuous and honourable life accomplished, the dying admiral turned his thoughts anxiously towards the green hills of his native land. The letter of Cromwell, the thanks of Parliament, the jewelled ring sent him by an admiring country, all reached him together out at sea. These tokens of grateful remembrance excited him a profound emotion. Without allowing that which he had served the commonwealth day and night earnestly, anxiously, and with rare devotion, England was grateful to her hero. With the letter of thanks from Cromwell a new set of instructions arrived which allowed him to return with part of his fleet, leaving a squadron of some fifteen or twenty frigates to ride before the Bay of Cadiz and intercept its traders, with their usual deference to his judgment and experience, the Protector and Board of Admiralty left the appointment of command entirely with him, and, as his gallant friend Stayner was gone to England, where he received a knighthood and other well-won honours from the Government, he raised Captain Stoaks, the hero of Porto Ferino, and a commander of rare promise, to the responsible position of Vice-Admiral in the Spanish seas. Hoisting his pennon on his old flag-ship, the St George, Blake saw for the last time the spires and cupolas, the masts, and towers, before which he had kept his long and victorious watch. While he put in for fresh water at Cascaes road he was very weak. "I beseech God to strengthen him," was the fervent prayer of the English resident at Lisbon, as he departed on the voyage. While the ships rolled through the tempestuous waters of the Bay of Biscay, he grew every day worse and worse. Some gleams of the old spirit broke forth as they approached the latitude of England. He inquired often and anxiously if the white cliffs were yet in sight. He longed to behold the well-up downs, the free cities, the goodly [illegible]. But if he was now dying beyond all doubt. Many of his favourite officers silently and mournfully crowded round his bed, anxious to catch the last tones of a voice which had so often called them to glory and victory. Others stood at the poop and forecastle, eagerly examining every speck and line on the horizon in hope of being first to catch the welcome glimpse of land. Though they were coming home crowned with laurels, gloom and pain were in every face. At last the Lizard was announced. Shortly afterwards the bold cliffs and bare hills of Cornwall loomed out grandly in the distance. But it was now too late for the dying hero. He had sent for the captains and other great officers of his fleet to bid him farewell; and, while they were yet in his cabin, the undulating hills of Devonshire, glowing with the tints of early autumn, came full in view. As the ships rounded Rame Head the spires and masts of Plymouth, the woody heights of Mount Edgcumbe, the [illegible] town of St Nicholas, the rocky steeps of the Hoe, [illegible], could not but many picturesque and familiar feature of that magnificent harbour rose one by one to sight. But the eyes which had so often had to behold this scene once more were not fated very much longer to do [illegible]. The most of the victorious squadron, the St George rode with its precious burden into the Sound, and just as it came into full view of the eager thousands crowding the beach, the piers, the walls of the citadel, or darting in countless boats over the smooth waters between St Nicholas and the coast, ready to catch the first glimpse of the hero of Santa Cruz, and salute him with true English welcome, he, in his silent cabin, in the midst of his heart-stricken comrades, now sobbing like little children, yielded up his soul to God.—*Life of Blake, Admiral and General at Sea. By Rupert Bruce.*

LITTLE MARY.

AND THE WAY SHE WOKE UP IN THE MORNING.

"O! I'm so happy," the little girl said,
As she sprang like a lark from her low trundle-bed,
"It's morning, bright morning! Good morning, papa!
Oh, give me a kiss for good morning, mamma!
Only just look at my pretty canary,
Chirping his sweet good morning to Mary!
The sunshine is peeping straight into my eyes
Good morning to you, Mr Sun, for you rise
Early to wake up my birdie and me,
And make us as happy as happy can be."

"Happy you may be, my dear little girl,"
And the mother stroked gently a soft clustering curl—
"Happy as can be—but think of the One
Who wakened this morning both you and the sun."
The little one turned her bright eyes with a nod—
"Mamma, may I say, 'Good morning to God?'
"Yes, little darling one, surely you may—
Kneel as you kneel every morning to pray."

Mary knelt solemnly down, with her eyes
Looking up earnestly into the skies,
And two little hands folded gently together
Softly she laid on the lap of her mother.
"Good morning, dear Father in Heaven," she said,
"I thank thee for watching my snug little bed,
For taking good care of me all the dark night,
And waking me up with this beautiful light.
Oh, keep me from naughtiness all the long day,
Blest Jesus, who taught little children to pray."
An angel looked down in the sunshine and smiled,
But she saw not the angel—that beautiful child!

POETRY AND PROSE.—One day in spring Sir Walter Scott and Lady Scott strolled forth to enjoy a walk around Abbotsford. In their wanderings they crossed a field where a number of ewes were enduring the frolic of their lambs.—"Ah," exclaimed Sir Walter, "'tis no wonder that poets, from the earliest ages, have made the lamb the emblem of peace and innocence!" "They are, indeed, delightful little animals," returned her ladyship, "especially with mint sauce!"

MISCELLANEA.

THE PHILOSOPHY OF A CANDLE.—It is not everybody who understands the bit of philosophy involved in the burning of a candle. We may readily suppose—and the supposition is not a very absurd one—that the wick is intended to burn and to give light. Such, however, is not the case. The parallel, or nearly parallel fibres of the wick form the walls of numerous minute tubes, up through which any liquid will ascend by the power of what is called capillary attraction; and it is in this minutely-divided state that oil of melted tallow is best fitted for combustion. The heat of the candle melts the upper part of the tallow, which then in a liquid state ascends the little tubes of the wick, and is there burned; it is true that the wick is burned also, but this is not a necessary condition of the arrangement, the candle would give forth its light even if the wick were formed of an incombustible material.

There never was any party, faction, sect, or cabal whatsoever, in which the most ignorant were not the most violent; for a bee is not a busier animal than a blockhead.

GUARD AGAINST VULGAR LANGUAGE.—There is as much connexion between the words and the thoughts as there is between the thoughts and the words; the latter are not only the expression of the former, but they have a power to re-act upon the soul and leave the stains of their corruption there. A young man who allows himself to use one profane or vulgar word, has not only shown that there is a foul spot on his mind, but by the utterance of that word he extends that spot and inflames it, till by indulgence it will soon pollute and ruin the whole soul. Be careful of your words as well as your thoughts. If you can control the tongue that no improper words are pronounced by it, you will soon be able to control the mind and save that from corruption.

AN INVALUABLE CURIOSITY.—Horace Walpole tells a lively story of an old porcelain vender, who had an exceedingly rare and valuable jar on which he set an almost fabulous price. One hot summer a slight volcanic shock, such as even these islands occasionally experience, jogged his house about his ears and split his precious vase. To an ordinary mind this accident would have been calamitous, but the china seller rose superior to fortune. He doubled the price of the article immediately, and advertised it as "the only jar in the world which had been cracked by an earthquake." Whether he got his money is not added, but he certainly deserved it.

ORIGIN OF NEWSPAPERS.—Mankind are indebted to Queen Elizabeth and Lord Burleigh for the first printed newspaper, which was entitled the *English Mercurie*. The earliest number is still in the British Museum Library, and bears the date of July 23, 1588. During the civil wars periodical papers, the champions of the two parties, were very extensively circulated, and were edited by such writers as Needham, Birkenhead, and L'Estrange, all men of considerable ability. In the reign of Anne there was but one daily paper, the *Daily Courant*. The first provincial journal in England was the *Orange Postman*, started in 1706, at the price of a penny, but a halfpenny was not refused. The earliest Scottish newspaper appeared under the auspices of Cromwell, in 1652.

ANSWERS TO CORRESPONDENTS.

WILLIAM IRBOTSON.—You can purchase the solidified milk of the patentees, but the mode of preparing it is kept a secret.

SELINA has written to us in such a very polite style, that we at once furnish an answer to her inquiry as to "the best mode of washing silks." Having never washed silks ourselves, we were obliged to consult a "Selina" of our own. She informs us that no silks look well after washing, however carefully it be done, and that this method should never be resorted to but from absolute necessity. She recommends that faded silks should be sponged with warm water and soap, then laid upon a flat board and rubbed with a dry cloth, after which they should be ironed *on the inside* with a very smooth-faced flat iron. If the iron be applied at once to the silk, it should be passed quickly and smartly over it, or it may be ironed *on the right side* if a thin paper be spread over it, to prevent the iron from glazing it.

INQUIRER.—The Gorgons, or *Gorgones*, according to classical mythology, were three sisters, daughters of Phorces and Ceto. They were named *Sthenо*, *Euryale*, and *Medusa*, all said to be immortal except the last-named. They are represented with their hairs entwined with serpents. Their hands were said to be of brass, their wings of the colour of gold, their bodies covered with impenetrable scales, their teeth as long as the tusks of a wild boar, and it was further said that they could turn to stone all on whom they looked. The Gorgons are said to have resided in the inland parts of Lybia, near the Lake of Triton, or the gardens of the Hesperides. *Perseus* is also said to have rendered his name immortal by the conquest of Medusa. The narrative states that he cut off her head, and that the blood that dropped from the wound produced the innumerable serpents that infest Africa. The horse *Pegasus* also arose from the blood of Medusa, as did *Chrysaor*, with his golden sword. It is further stated that Perseus, after performing wonderful exploits with the head of Medusa, placed it on the ægis of Minerva, which he had used in his expedition, and that it still retained the same petrifying power as before.

Y Z.—You will find some easy and familiar lessons on music and singing in "The Popular [illegible]ator."

MASSIP.—We see no impropriety in your "claiming relationship to a gentleman" if you are, indeed, related to one, though you be "a working man." But if you have not the proofs of this in your own possession, it is quite impossible that we can help you to them. If we understand your long letter rightly, the alleged relationship is somewhat equivocal in its character.

G. R. H. (Newcastle).—It is not likely that he article on "Cromwell and his Times," published in the early volumes of "The Working Man's Friend," will be reprinted in a separate form. A large portion of the matter, with some aluable additions, will be found in Dr Ferguson's History of England, which forms four volumes of "*John Cassell's Library.*"

A B C.—We fear that the marks "you allowed to be made in your flesh when a youth," however they may "disfigure you," must remain in your flesh till the end of your days. At least *we* know f no chemistry by which they can be obliterated.

E PLURIBUS UNUM.—We have an answer ready for you. Please to favour us again with your address, as we have mislaid the one you ent.

T. D. D. asks, "Which of the sciences is most worthy of studying?" That depends entirely upon the occupation or course of life you think of adopting. The study of navigation, for example, would be waste of time to a youth who intends to be a cabinet-maker or a mason.

L. E. M.—You may safely invest your property in the way you mention. The New 3½ per Cent Consols are generally accounted the most profitable. The rate of interest is about 3¼ per cent. You need not fear the effect of "political events" to produce any material alteration in the value, or to weaken or endanger the security.

A B C.—You should obtain advice from an experienced medical practitioner; but beware of using just any drug that may be recommended. We fear the case you mention is beyond the reach of medicine.

W. M. F.—We cannot undertake the binding of books, but boxes suitable for "The Working Man's Friend" may be obtained at our office, by an order given to any bookseller.

J. T.—The cases of instruments and boxes of colours, for cheap sets of which the Society of Arts offered premiums, are now ready, and may be had of the makers.

D. I. (Stockport).—Lessons in French have already been published in "The Working Man's Friend," and have been reprinted in a separate and revised form in a sixpenny book, which may be had at our office, or by order on any bookseller.

H. ALFD.—We know of no law to prevent a man from marrying "his own mother's brother's first wife's sister's daughter" if he prefers her to any other woman.

CYMRO.—It is impossible for us to judge of the reasonableness of your surgeon's charges. Doctors' bills are not pleasant things, and patients too frequently forget that often sacrificed to qualify them for their profession, and that they are put to great expense to maintain appearances.

A SUBSCRIBER.—"*Beat*" is the proper word. In the sense to which you refer, it means *a tract* or *district*. "*Bate*" or "*bait*" would be no sense.

A. Z. M. N.—Bird's Patent Filter, mentioned in "The Working Man's Friend," No. 25, may be obtained at the Wenham Lake Ice Company's, 364, Strand. It is a fact that artesian wells, however numerous, will not supply sufficient water for the consumption of the metropolis.

L. MARTIN.—The "choir organ" is that part of the larger instrument used in cathedrals to accompany the choir or singers. It is softer in voiced than the rest of the instrument.

W. W. will find a description of the telescope in No. 22. A "compound achromatic microscope" consists of two or more combinations of lenses, by one of which an enlarged image of the object is formed, and by means of the other, or eyeglass, a magnified representation of the enlarged image is seen.

W. P. S.—A *common* marriage licence will cost you 10s.; a *special* licence, £5. Marriage by *ban*—that is, after having been "asked," it is called, three times in a church—renders a licence unnecessary. The above charges do not include the fee to the clergyman, &c. The Registrar is the person to whom application must be made for licences.

H. F. B.—There are many receipts for making French polish, and it may be bought ready made at any respectable varnish-makers. It may be prepared as follows:—Pale shellac, one pound; mastic, two ounces; alcohol (spirits of wine 90°), one quart. It must be made in the cold, frequently stirring or shaking the ingredients together in a well-closed bottle or other vessel. French polish is used without filtering. There are several varnishes proper to be used on wood, but the preparation of them is somewhat troublesome and expensive, and they may be easily procured in small quantities from any varnish-maker.

A CONSTANT READER.—You require no licence to sell books in a shop; but if you go about either town or country offering them for sale, you become a hawker, and will require a hawker's licence, for which you will have to pay £4 if you employ a horse or ass, £8. We mention this the more particularly, because, in No. 29, owing to a misprint, 4s. and 8s. are named instead of £4 and £8. You may obtain books at the wholesale prices at any publishers or large booksellers. The usual allowance is 25 per cent.

F. BODEN.—Apply at our office.

W. B.—Johnson's Dictionary, from 1s. upwards.

B. WINTERBORN.—We cannot answer.

A YOUNG TEETOTALER.—Cyder is intoxicating, and its use is therefore proscribed.

C. ELLIOTT'S lines have been received.

DARWEN'S hints will be borne in mind.

C. S., J. R., and S. B.—Received.

All Communications to be addressed to the Editor at the Office, 335, Strand, London.

Printed and Published by JOHN CASSELL, Strand, London.—May 8, 1852.

THE

NEW SERIES.—VOL. II., No. 33.] SATURDAY, MAY 15, 1852. [PRICE ONE PENNY.

EGYPT: ITS EDIFICES AND ITS PEOPLE.

THE HOLY LAND.—JOURNEY THROUGH THE DESERT.

THE route to the Holy Land from Egypt, is, like that of the ancient Israelites, through the Wilderness. One of the most peculiar features of the journey is the mode of travelling, camels being almost universally used to carry both passengers and luggage The species of camel employed for this purpose has one large hump on the back, while the Bactrian has two, one on the shoulders, and the other on the croup, and its height is said to be considerably greater than that of the Arabian camel.

TO SET OUT.

In order that the traveller may experience as little inconvenience as possible while seated on the camel's back, a large pack-saddle of straw is fitted to his sides, in order to raise them, so to speak, to the level of his hump. On the top of this rude saddle a framework of wood is placed, by means of which loads of merchandise can be fastened to the animal or heavy panniers hung to his sides.

The arrangement for riding is a little different; the wooden frame has two short, round pieces of wood, reaching up in front about eight inches and the same in the rear, making a surface or saddle for the rider about two feet in length between these short posts: here are placed the cushions, or something of the sort, on which the traveller sits, and the pieces of wood, both before and behind, prevent his sliding backwards or forwards, and often save him from falling off the camel's back. The animals trained for riding are usually termed dromedaries, but are in no other respect distinguishable from the ordinary camels. Unlike a horse, in beauty as well as in speed and intelligence, the camel stands too high to be mounted by means of stirrups; consequently, it is compelled to kneel and bring its huge body nearer to the level of the traveller before he can get upon its back. The driver standing at its head, makes a singular clicking or gurgling sound in his throat, which the animal understands, and after a few moments and some growls of discontent, the camel falls upon the knees of its fore legs, then bends its hind legs partly under its body, and finishes by stretching out its fore legs upon the ground, and

remains thus, its belly touching the sand, as long as may be required. In this position it is easy to mount; and the rider being fairly astride, the camel gets up again. It first raises its hind legs, and then scrambles up on its fore legs. The effect of this is to give the rider a sudden pitch forwards and almost as sudden a pitch back again to a level position; unless he is very careful and has got perfectly secure on his seat, he is almost certain to be thrown over the camel's head, which is no trifling matter. In general, persons ride without stirrups, but some rather timid riders prefer the European method, as it prevents their legs from dangling about. At first the rider is apt to feel that his position is rather too elevated for comfort, and it is not to be wondered at if he looks somewhat anxiously at the height from the ground, and thinks very seriously of the chances of a broken head, or neck, it may be, in case he is thrown off unawares. But a little experience reconciles him entirely to this arrangement, when he has spent a hot day in the desert. On the sand the heat is intolerable, but on the camel's back there is usually a tolerably free circulation of air, and the traveller feels the value of his lofty elevation, and is glad at any price to purchase some exemption from the power of the burning sun.

All being ready, the camel-driver leads the animal forward, and the rider immediately finds that the motion produced by its long strides and peculiar gait, is by far the most singular he has ever experienced. Now he pitches forward, now backward, now sideways, and now he experiences a movement consisting of a mixture of all three. For a while he is in great terror of falling off, and grasps the pommels, if they may be so called, of the wooden saddle with desperate earnestness, and if his head is not well, or he is easily affected with nausea, he *may* feel something of what is commonly called sea sickness, ladies not unfrequently suffer in this way. But, supposing that he escapes this mishap, he is some little time before he dares look around or try to enjoy the novel scene. He still feels suspicious and is uneasy at the growling and unpleasant noises of the camels, as he does not yet understand the habits of the animal, and suspects that some dreadful accident will most certainly occur before he arrives at the end of the first stage. By and by, too, his back begins to ache, and he finds this perpetual see-saw sort of motion, which is not discontinued for a moment, so unnatural and so hard a trial of the muscles of that part of the body, that he is soon fatigued and convinced that he can never endure the ride for any great length of time. And when towards evening he dismounts, running the same risk of a fall as when he went through the operation of getting upon the camel's back, he aches all over so much, his limbs are so stiff, and he is so completely fagged out, that he is ready to lie down almost in despair, and groan bitterly over the prospect before him.

This is usually the first day's experience. on the second, he finds camel-riding somewhat more tolerable; on the third, he becomes quite reconciled to it; and subsequently, when he is entirely at home in his pl[illegible], riding in any one of a half-dozen different positions which he may choose, forwards, backwards-sideways, cross-legged, and so on, and is so much at ease as to read comfortably, and even make notes as he goes along. And at last the traveller gets rather to like this kind of locomotion, and actually finds that he can go through more on the back of a camel than on horseback, he is convinced, too, that for a long journey the former is preferable to the latter in many respects, and has advantages which cannot be attained in any other way.

The camel is, indeed, invaluable to the Arab, for it is to him what the reindeer is to the Laplander. It has been justly styled "the ship of the desert," and without it the Arabs like the Africans, would be unable to cross the seas of sand which stretch around him on every side, or to carry that merchandise which is now readily transported by means of the caravan. It has been eloquently said in an address to the camel—

> "Where the hot air is not stirred
> By the wing of singing bird,
> There thou go'st untired and meek,
> Day by day, and week by week,
> With thy load of precious things,—
> Silks for merchants, gold for kings,
> Pearls of Ormuz, riches rare,
> Damascene and Indian ware—
> Bale on bale, and heap on heap,
> Freighted like a costly ship!
> And when week by week is gone,
> And the traveller journeys on
> Feebly, when his strength is fled,
> And his hope and heart seem dead:
> Camel, thou dost turn thine eye
> On him kindly, soothingly,
> As if thou wouldest, cheering, say,—
> 'Journey on for this one day,
> Do not let thy heart despond,
> There is water yet beyond'
> I can scent it in the air—
> Do not let thy heart despair!'
> And thou guid'st the traveller there."

A traveller thus describes the events of a day or two spent in the desert:—

"We rose usually at daybreak, so as to secure an early start in the pleasantest part of the day. Our toilet was very simple, it being enough if we could get our hands and faces clean; our breakfast was equally simple, and soon despatched. Next came the packing up; the tent was struck, the camels were made to kneel down and receive their loads; our dromedaries were arranged for riding, and in the course of an hour and a half, we took up our line of march. Under no circumstances could we manage to save time here, where it was so important, for hurry as much as we chose, there were just so many camels to load, and just so much to do, and we found that it always took about the same amount of time to accomplish all this in; consequently seven, or a little before was our usual hour of starting. For a while, the temperature was very delightful, and the bright sun, shining in all his glory, gave something of an air of animation even to the desert; but towards noon, and during the middle hours of the day, the heat became at times well-nigh unbearable; and had it not been that almost always we had plenty of wind in our elevated positions on our dromedaries, I fear that besides having my face and hands burnt black, I, at least, should have suffered much more serious injury from exposure to the scorching rays of an African sun at this period of the year. But we did not stop on account of the heat, nor fortunately were we impeded by any storms or any mishap of any kind. on we travelled, slowly, it is true, but steadily, not making much, but always doing something, our faces set towards the East, and our thoughts and hearts intent upon reaching the Holy City. At one time, our way was through the soft deep sand, into which our poor beasts would sink over the hoofs and labour exceedingly in getting onwards; at another, we came upon some level tracts, where the salt water had lain, but being dried up, there was now presented a curious appearance as the salt lay like scattered snow or ice upon the surface of the ground; sometimes the surface of the desert was nearly a plain, covered with only here and there some prickly shrubs, clumps of bushes, stunted grass, &c., but, more generally, we met with low hills and valleys, and more variety and unevenness of ground than I had been led to expect. For miles and miles, on our right hand and on our left, we beheld vast broad hills and mounds of fine, light, yellowish sand, which had drifted from one place to another just like snow drifts, and at every high wind, kept changing more or less its position; and we could not but be struck with the desolate and disheartening look which such a scene presented to our eyes. The life and beauty which the cultivated and fruitful regions of the earth offer to the admiration and gratitude of the beholder, are here extinct, and the spirit of man sinks within him, as he contemplates a prospect so terrible, were there no hope of escape from it, and so fearful, were he condemned to pass in such a spot the remainder of his days. As I gazed upon the desolate wilderness, through which we travelled, I felt as never I had felt before, the severity of that punishment which the rebellious Jews brought upon themselves; and while riding slowly onward, or at night, in our tents, I read in my Bible of the wandering of the children of Israel with a deeper and clearer sense of the meaning of God's holy word than it had been my lot at any previous time to attain. How forcible appeared now the

expressions of Scripture respecting what this stiff-necked people were compelled to undergo!

'A desert land . . . the waste howling wilderness.'
'That great and terrible wilderness, wherein were fiery serpents, and scorpions, and drought, where there was no water,'
'Wherefore have ye made us to come up out of Egypt, to bring us in unto this evil place? It is no place of seed, or of figs, or of vines, or of pomegranates; neither is there any water to drink'
'The soul of the people was much discouraged because of the way
And the people spake against God, and against Moses, Wherefore have ye brought us up out of Egypt to die in the wilderness? for there is no bread, neither is there any water; and our soul loatheth this light bread.'

'While the meat was yet in their mouths,
The wrath of God came upon them,
And slew the fattest of them.
And smote down the chosen men of Israel
* * * * *
Therefore their days did he consume in vanity,
And their years in trouble.'

'Neither said they, where is the LORD
That brought us up out of the land of Egypt,
That led us through the wilderness,
Through a land of deserts and of pits,
Through a land of drought, and of the shadow of death
Through a land that no man passed through,
And where no man dwelt?'*

Would God that there were such an heart in Christian people that they would ponder upon these things, and that they would consider and know that He will not at all spare the wicked, nor suffer to go unpunished the guilty nations who break His commandments or set at naught his holy will!

"Towards midday, we usually halted for a short time to lunch and to give our camels an opportunity to browse awhile upon the prickly shrubs and stunted bushes which are found in considerable abundance nearly everywhere in the desert. We would, on such occasions, spread our seggadeh upon the clean sand, and Antonio, our servant, having set before us a cold chicken, or something of the sort, with some dates, oranges, &c., we enjoyed our repast as well as the burning sun would admit, and quenched our thirst, as best we might, with the dark reddish coloured water which was carried in leathern buckets attached to our camels' sides. Remounting again, we pressed onward with renewed vigour, now, one after another new or strange thing met our view. Here and there, we beheld some groves of palms which looked doubly refreshing and attractive in the midst of the waste and dreary desert on all sides: occasionally some dome-covered tomb of a sheikh or Mohammedan saint, served to add variety to the scene: very frequently, we came upon the carcasses and bones of some poor camels which had dropped down with fatigue or thirst, and had been abandoned to the vulture and beasts of prey that watch the track of caravans in the desert unceasingly: and at such times we thought of the touching lines of the poet Collins:—

In silent horror o'er the boundless waste
The driver Hassan with his camels past;
One cruise of water on his back he bore,
And his light scrip contained a scanty store.
The sultry sun hath gain'd the middle sky,
And not a tree, and not an herb was nigh.
Shrill roar'd the winds, and dreary was the view!
* * * *
"Ye mute companions of my toils, that bear
In all my griefs a more than equal share!
Here, where no springs in murmurs break away,
Or moss-crowned fountains mitigate the day,
In vain ye hope the green delights to know,
Which plains more blest, or verdant vales, bestow,
Here rocks alone, and tasteless sands are found,
And faint and sickly winds for ever howl around,
Sad was the hour, and luckless was the day,
When first from Shiraz' walls I bent my way!"

"At one time, we saw the desert quails, some small birds, lizards, and several of that beautiful and most graceful animal the gazelle, who, with ears erect and bright glancing eyes, looked timidly at us for a few moments, and then bounded fleetly off to a place of greater security; at another, not a vestige of life was visible, all was silent as the grave and gloomy as the sepulchres of the dead, and our spirits sank within us, and we longed once more to revisit the abodes of men and look upon the green fields, the trees, and gardens of an inhabited land: occasionally, though but rarely and in the neighbourhood of marshy places, there appeared a larger bird or two, and we were forcibly reminded of the striking figure used by the Psalmist when he was overwhelmed by affliction and poured out his complaint before the Lord;—

'I am like a pelican of the wilderness,
I am like an owl of the desert,"*

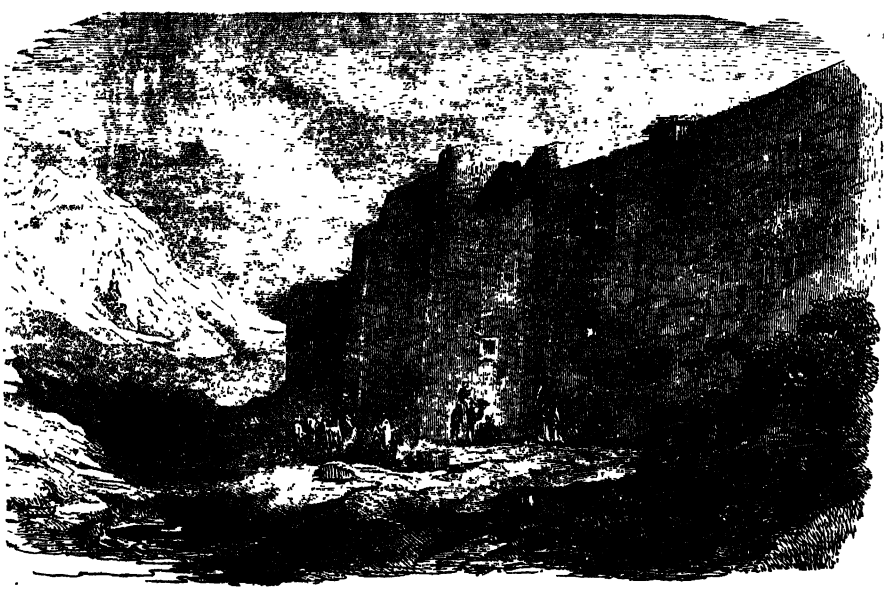
"Now we saw the mirage, that singular illusion, which often deceives the most experienced, and which for the moment gladdened our eyes with the prospects of quiet and refreshing lakes, and trees on their banks, most desirable for their enticing shade, only to depress our spirits the more when the conviction forced itself upon our minds, that all which we beheld was unreal and baseless as a dream. now, again, we came upon flocks of goats, cropping the scanty herbage which they could find in the desert, and not far off we noticed a Bedawy encampment, with some children, females and noisy dogs, close by, the former hiding themselves under the coarse blankets rudely supported on sticks stuck in the ground, and peeping out at the Frank strangers, the latter barking and snarling most disagreeably. As the day advanced, we found out, occasionally, what it was to travel through the territories of the wild sons of the desert, for, at intervals, some keen black-eyed Bedawin suddenly started forth, as it were from the ground, and in peremptory tones, demanded tribute for the privilege of crossing *their* desert; a demand, which on the whole, we deemed it best to satisfy for the sake of peace, though with our large party, we might easily have resisted all such claims.

"About five o'clock in the afternoon, our thoughts began to be turned to our evening encampment, and between that and sundown, we looked out rather anxiously for a good place to pitch our tent in. This being obtained, the caravan halted, and the tired camels being made to kneel, were released from their loads, and turned loose to roll in the sand, and browse upon the various sorts of nutriment, which a kind Providence has furnished for them, even in the arid desert. In the course of an hour or so, we were comfortably seated in our tent (which consisted of canvass, upheld by a single pole in the centre, and kept in its place by numerous ropes, fastened to pins driven into the sand), and were glad to sit down to our dinner, and refresh our jaded bodies. Generally, we were too much fatigued, to do more than write down some brief notes of the day's events, and, save, perhaps, a stroll out to gaze at the bright stars, and listen, if so I may speak, to the profound and solemn stillness of the vast desert, we rarely pretended to attempt anything in the way of occupation. At an early hour, we lay down on our beds, which were much like the ordinary cot bedsteads, only arranged to fold up into small compass, and commending ourselves to the protection of Him, who neither slumbers nor sleeps, we slept as only the weary and wayworn pilgrims rest, in security and peace. Sometimes in the night I was aroused by the low-toned and monotonous songs of the Arabs, who take this method of keeping themselves awake, and manifesting their watchfulness, or by the braying of a donkey, or the noisy and sharp barkings of the wolfish Bedawin curs; but never had I or my companions any cause of apprehension from the attacks of robbers, or the thievish propensities of many of the lawless inhabitants of the desert. We suffered no loss whatever, during our entire journey from Cairo to Gaza."

The group of mountains to which Sinai belongs, and which also includes other remarkable summits, is surrounded on all sides by deserts occupied only by tribes of Bedawin Arabs. The mountains are penetrated by deep chasms, edged by bare perpendicular ledges of rocks, and the whole has a singularly wild and sterile appearance.

The convent of St. Catherine, founded by the emperor Justinian, is situated in a valley on the slope of the mountain.

* Deut. xxxii. 10, viii. 15, Numb. xx. 5, xxi. 4, 5, Ps. lxxviii. 31, 33, Jer. ii. 6.



Being exposed to the attacks of the Arabs, it has been built in a peculiar manner and has much of the appearance of a fortress. It is an irregular, quadrangular edifice, surrounded by high and solid walls, and covers a considerable extent of ground. To prevent being surprised by their troublesome neighbours, the entrance-gate, which is rarely opened, is built up; and on ordinary occasions, all access to the convent is by an entrance about thirty feet from the ground, to which travellers and provisions are raised in a basket by means of a windlass.

The interior of the convent presents little that is worthy of note; all the apartments and chapels being built of rough stone, without order or symmetry, and communicating by crooked and dark passages. The Church of the Transfiguration is, however, an exception to the rest. It is eighty feet in length, and fifty-three in breadth, and is paved with marble, adorned with a variety of figures.

It is a curious fact that there is a Mohammedan mosque

It should, however, be remarked, that the names of Horeb and Sinai are used interchangeably in the inspired books of Moses, to denote the mountain on which the law was given. The most obvious and common explanation of this circumstance is, to regard Sinai as the general name for the whole cluster, and Horeb as designating a particular mountain; much as the same names are employed by Christians at the present day. So, too, the Arabs now apply the name Jebel-et-Tûr to the whole central granite; while the different mountains of which it is composed are called Jebel Kâtherin, Jebel Muss, &c. Robinson, on looking at the subjects during his sojourn in the convent, he was led to a similar conclusion; applying the names, however differently, and regarding Horeb as the general name, and Sinai as the particular one. This conclusions seems to be favoured by two circumstances, one that before and during the march of the Israelites fro Egypt to the place where the law was given, the latter called only Horeb, just as the Arabs now speak

CONVENT OF ST. CATHERINE.

within the precincts of this convent. It has also, at a little distance, an excellent garden, producing fruits, plants, and vegetables, in the utmost profusion. It is reached by a subterraneous passage, secured by iron gates. The climate is temperate in consequence of the elevation.

The ascent to the mountain which lies to the south-west commences close to the convent. It is steep, but the labour of ascending has been greatly facilitated by steps cut in the rock. At the height of about five hundred feet from the convent is a spring of fresh and cold water, covered by a rock which protects it from the sun and rain. After ascending a little higher the traveller gains the summit of Mount Horeb, which forms, according to Laborde, a kind of breast from which Sinai rises. On continuing the route from this halting-place by a path still more rugged and steep than before, the summit of Sinai is reached, the apex of a peak, not more than fifty yards across at its widest part.

Jebel-et-Tûr; while during the sojourn of the Hebrews before the mountain, it is spoken of, with one exception only, as Sinai; and after their departure it is again referred to, exclusively as Horeb. The other and main fact is, that while the Israelites were encamped at Rephidim, Moses was commanded to go on with the elders before the people, and smite the rock in Horeb, in order to obtain water for the camp. The necessary inference is, that some part of Horeb was near to Rephidim; while Sinai was yet a day's march distant.

Gaza is a name which calls to mind some of the many interesting portions of the Old Testament history. It was once a city of great importance, and figured largely in the eventful life of Samson, the mighty champion of his oppressed country. A considerable part of the city is situated on a high hill, between one and two miles from the sea, and is therefore a very prominent object to any one who looks upon it from thence

with interest. The modern city is mainly in the valley, on the east and north. To the south-east is a hill of no great height, called by some writers "Samson's Mount," as being the hill mentioned in the book of Judges, * to which that mighty man carried off the gates of Gaza. This hill may properly be said to be *before*, that is *towards*, Hebron, since there is no reason to suppose that the gates were carried to any great distance. All vestiges of the ancient walls and ancient strength of Gaza have disappeared, and nothing remains to mark its former extent except the bounds of the hill itself on which it stood. Even the traces of its former existence, its vestiges of antiquity are very rare, consisting of occasional columns of marble or gray granite, scattered in the streets and gardens, or used as thresholds at the gates and doors of houses, or laid upon the front of watering-troughs. One fine Corinthian capital of white marble lies inverted in the middle of a street running from north to south, along the eastern foot of the hill.

AFRICAN PROVERBS.

If there be still any adherents among us of the once universal "baboon theory," and any extreme depreciators of "African intellect" we beg leave to refer them to the Rev. Samuel Crowther's recently published *Yoruba Vocabulary* for a confutation of their favourite dogma. The Yorubans are natives of Africa, living on the coast between Lagos and Abomey. This book not only shows that an "African" can become a highly educated being, but proves, what is far more to the purpose, that a whole African race, numbering 3,000,000, exists, possessing a language highly refined and developed, abounding in expressions which could only have arisen among a people in a state of considerable civilisation, and rich in proverbial sentences exhibiting, not only a shrewd and worldly-wise, but also a gentle and moral people. "You think yourself very wise," says the Yoruban, "but you can't tell me what nine times nine makes." "The club-collection will be due six days hence; when you have taken your share let me know." What this club-collection is, is explained by another proverb—"Every 17 days is the gathering of the Egbas," but few of our readers will be prepared for the assertion that these Yoruban "savages" have a regular system of benefit clubs, the members of which meet every 17 days, and that in Abbeokuta alone there are more than a thousand such clubs. Here are some more of these proverbs —"Consideration is the first-born, Calculation the next, Wisdom the third" "When the goat has fed it returns home, when the sheep has fed it returns home, not returning home after feeding ruins the character of the pig." "Everything has its price, but who can set a price upon blood?" Here, too, is a sentiment one would not have looked for from a "savage"—"Because friendship is pleasant, we partake of our friend's entertainment, not because we have not enough to eat in our own house." "A wild boar, in place of a pig, would ravage the town, and a slave make a king would spare nobody." "The time may be very long, but a lie will be detected at last" He who shares his friend's prosperity, but does not move a hand to help him in his work, is selfish; for he who eats the sweet should be ready to eat the bitter." "The steeks are not pleasant, but they are good for a rogue." "The trader never confesses that he has sold all his goods, but when asked he will only say 'Trade is a little better'" Here is one which might be recommended to the Dean and Chapter of Rochester in the matter of Mr Whiston —"I have the protection of powerful friends, you cannot involve me in ruinous law expenses"—an expression which makes one wonder if there is a sable Lord Chancellor at Abbeokuta, and whether there be chancery-suits in that happy land —Here, too, is another of the same kind —"A man walks at ease in the presence of his defamer, a man steps proudly in the presence of his abuser, when he knows that neither of them has twenty cowries in his house;" from which one is tempted to infer that Mammon is worshipped among the Yorubans as well as ourselves One or two more, and our string of proverbs is complete Among the East African tribes it has been said that the feet of gratitude does not exist; not so among the Yorubans—"An ungrateful guest is like the lower jaw, which when the body dies in the morning, falls away from the upper by night time." Some "savage" tribes have no sense of pity, but the following Yoruba proverb closes our illustration with a beautiful inculcation of that feeling —"A slave is not a senseless block of wood When a slave dies his mother hears nothing of it, but when a free-born child dies there is lamentation, yet the slave, too, was once a child in his mother's house."

* Judges xvi 3

THE HISTORY OF THE PEARL.

Very few persons who visited the Exhibition of the Industry of All Nations, came away without noticing the splendid collection of precious stones contributed by Mr. Hopo. It stood in its little iron cage just in front of the Holland court. In addition to the various precious stones contained in this collection, there is the monster pearl which far exceeds in size any other specimen of the kind in the Exhibition or in this country. It weighs 1800 grains, and is two inches long, and 4½ in circumference. We are all familiar with the appearance of the pearl; a few sentences therefore of the history of this interesting jewel may assist our lady readers' appreciation of it.

The pearl, so called, on account of its form, from the Latin word *sphe'ula*, a round body, is found attached either to the inner part of the shell of the pearl oyster, or else in the thick fleshy part of the animal itself. This beautiful jewel, known as the pearl, is produced by the oyster itself, and is formed of a material secreted by the animal. The real cause of the oyster's forcing this substance within its bivalve house, seems to be in fact nothing more than an effort of the little animal to get rid of a source of irritation, such as a grain of sand or some such small foreign body, which has insinuated itself between the mouth of the oyster and the shell, or some enemy of the oyster perforating the shell from the outside, to get within reach of its prey. In either case, the oyster envelopes the sand or other substance, or closes up the aperture, formed with a smooth coat of membrane, over which it spreads a layer of nacre or pearl. The word *nacre* comes from a Spanish word signifying *mother-of-pearl*, or the shell in which we find the pearl.

In both these cases we usually find the pearl adhering to the internal surface of the shell. The best and the most valuable specimens are however generally found in the body of the animal, and the source of irritation in this case is proved, according to the attentive observations of Sir Everard Home, to be an ovum or egg of the oyster, which, instead of coming to maturity, and being thrown out of the shell by the mother along with the others, proves abortive, and remains behind in the capsule in which all the ova were originally contained. This capsule being still supplied with bloodvessels from the parent-animal, goes on increasing in size for another year, and then receives a covering of nacre, the same as the oyster spreads over the internal surface of the shell. The animal adds a fresh layer every year to the nucleus thus formed, which thus increases in size; and it is probable that the oyster deposits this pearly covering, not so much in any regular quantity as in proportion to the amount of irritation it experiences from the exciting cause.

The peculiar lustre of the true pearl, and which distinguishes it from all artificial means of imitation, arises from the central cell, which is lined with a highly polished coat of nacre, and the substance of the pearl itself being diaphanous, the rays of light easily pervade it.

The chemical constitution of the pearl is carbonate of lime (of which common chalk is another form); hence, the possibility of the luxurious Romans dissolving them in vinegar and drinking the solution. The story of Cleopatra is well known, in which, in order that she might be enabled to expend a larger sum in one feast, than Mark Antony had done in the series of sumptuous repasts he had provided for her gratification, she took a pearl from her ear, said to be valued at £80,729 3*s*. 4*d*. of our money, and having dissolved it in vinegar, drank off the solution.

Large sums are mentioned by ancient historians as having been given in former times for pearls: these statements may or may not be correct; we, therefore, proceed to speak of the actual money-producing value of some of the pearl-fisheries of the present day. In 1804 our government leased the pearl fishery at Ceylon for £120,000 for one year; but in 1828, it brought only £30,612. The value of the pearl-fisheries of Bahrim in the Persian Gulf, may be reckoned at more than £200,000 annually, or taking the produce of the whole gulf, not far short of £350,000 per annum. Of course our readers are aware that the pearls are obtained by divers. In the Ceylon fishery as many as 1500 divers are sometimes employed. The divers share the profits of the fishery, in a certain proportion

—a mode of employment which gives the labourers about five or six shillings a day. Of course, this is considered most excellent pay in a country in which the ordinary rate of wages seldom exceeds about sixpence a day. The divers in six or seven fathoms of water, usually remain immersed about fifty or fifty-five seconds; a reward having been offered to him who could remain longest under water, it was gained by one who remained at the bottom for eighty-seven seconds. The diver carries down a sack with him in which to put the oysters, and which, when filled is pulled up by a rope into a boat on the surface, ready to receive it. If the diver is exhausted, he is pulled up with the bag, but this is seldom the case, as it is much easier to rise to the surface of the sea than to keep at the bottom. The business of a pearl-fisher is not considered by any means unhealthy, and the period of fishing—which seldom occupies more than two months in the spring—is considered as quite a holiday by the labourers in the Indian islands. The use of a diving-dress and apparatus has never, we believe, been tried in the pearl fisheries.

All along the coasts of Ceylon and Coromandel, on the shores of the Persian Gulf, and on various parts of the Pacific et of South America, as well as at Algeria and the Bay of Panama, the pearl oyster makes his home. Each bank available only for about two months in about seven years, and the banks are seldom disturbed till the oysters are supposed to be in a fit state for gathering. When the oysters are brought to land, they are thrown into a pit and allowed to rot, so that the pearls can be extracted without injury to their delicate structure. Very little preparation is necessary to fit the pearls for sale, as regularity of shape is not much regarded by the purchaser.

The largest pearl of which we have anything like a correct account, is one which the king of Persia bought of an Arab in 1623 for £110,000. It is pear-shaped, of a regular form, and without the slightest blemish. It measures 6¾ inches in diameter at the largest part, and is nearly one inch and a half long. Pearls are found in various places in Great Britain, and there was a specimen or two in the Exhibition of Scotch pearls.

From 1761 to 1764 £10,000 worth of pearls were taken at Perth. The rivers of the counties of Tyrone and Donegal have also yielded pearls. Mother-of-pearl is the lining or inner part of the shell of the pearl oyster, and differs from true pearl only in form, and in being less compact and lustrous.

It is the large oysters of the Indian seas alone which secrete this coat of sufficient thickness to render it available for the purposes of manufacture. Nearly one million pounds weight of this mother-of-pearl are annually imported into this country. In the early part of last year a ship arrived in London from the bay of Panama with upwards of two million pearl shells, to be used principally in the manufacture of shirt buttons. It is curious to think that the pearls which deck the head of a queen, and the buttons which the poor bachelor sews on to his "other shirt," are precisely alike in structure, came from the same miserable diseased oyster, were fished up by the same dusky Indian divers, and differ in nothing but an artificial money value!

VINCENT PRIESSNITZ.

The celebrated town of Grafenberg stands now, where five and-twenty years ago only a few small cottages were to be seen clustered in one of the ravines of the Silesian mountains. In one of these Vincent Priessnitz was born on the fifth of October, 1799. He was the youngest of six children; his parents were descended from families which had settled in that neighbourhood many centuries before. Very little is known of his boyhood. His father was for many years blind, and Vincent was obliged to be his guide on all occasions; he has been heard to say with regret, that from this cause he was unable to attend school.

In his seventeenth year, when he assisted in the farm labours, he met with an accident; a horse which he was driving down to the meadow took fright, ran away, and Vincent fell under the wheel of the cart, which knocked out his front teeth and broke several ribs. Every one gave up hopes of saving his life, and the physicians declared his recovery to be impossible. It was at this time that his great discovery appears to have dawned upon him, for he washed the wounds with cold water and made use of wet bandages. In a few weeks, to the surprise of all, he began slowly to recover. The effects of this fall, although they did not at once manifest themselves, still began to tell inwardly on his constitution, and in all probability would in the end have been fatal, if he had not continued his course of cold water, aided by a naturally strong and hardy constitution. From the moment of his recovery, Priessnitz was filled with a belief in the wonderful curative power of cold water, and gained a confidence in it, which was continued and strengthened by some successful attempts first upon animals, and afterwards upon his neighbours. His progress was now slow but steady, and the happy results of his treatment remained no longer secret, and the fame of this young physician of nature began to spread far and wide. When scarcely nineteen years of age, Priessnitz was often called to Moravia, and even to [illegible], and the eyes of the world began to be turned towards him. Although his renown was as yet but small, there were many who endeavoured to raise charges of imposture and quackery against him. He was pronounced a charlatan by the faculty, the common people called him a fool, and believed him to be in league with Satan, and he was denounced from the pulpit as a false prophet.

In the mean time Priessnitz calmly and modestly pursued his course among all these threats and persecutions, firm in the consciousness of rectitude, and full of the great idea which had awoke within him. In the year 1829 the number of applicants for his advice was so great in Grafenberg, that a list of these visitors was voluntarily made. This was too much for the envy of his enemies to bear. Priessnitz was commanded to appear before the magistrate of the little town of Freiwalden on a charge of charlatanism, and was condemned to several days imprisonment, sharpened by fasting, at the same time the sponge with which he washed his patients was taken from him under the pretext that it was in some way connected with sorcery! An appeal had the effect of [illegible] and the higher tribunal before which this appeal was carried [illegible] to evidence in any way against him, gave him permission to open a curative establishment, but the envy which had been once set in movement was not so easily stayed, and the chancellor's court was continually besieged with complaints, accusations, and petitions, this came to such a pitch at length, that the court felt itself called upon to [illegible] commission to investigate the state of affairs [illegible] for this purpose made choice of Baron Tuchelm. The report which this acute and learned physician furnished upon the life, proceedings, and course of treatment of Priessnitz, was not only favourable to the latter, but also highly honourable to the baron's character as an unprejudiced and enlightened man. In consequence of this report Priessnitz was protected by the chancellor's court. From that time he was freed from the open attacks of his unrelenting and bitter adversaries. Secret annoyance and petty malice followed him, however, to the end of his life. His fame had now spread over almost the whole of Europe. From the most distant countries sufferers and invalids, who were given up by the faculty, hastened in crowds to place themselves under the immediate care of the high priest of hydropathy, hoping by this new [illegible] of cold water to regain their health, or at least to have their sufferings relieved. Thus in a few years Grafenberg has, from being a cluster of poor and unknown cottages, become a place of world-wide renown, and the name of Priessnitz has become familiar in the mouths of all civilised nations.

An interesting field of observation and experience opens itself here to the eye of the man of the world, the psychologist, and the philanthropist. The unheard of results produced by the water treatment of Priessnitz influenced thousands to reformation, and it is a remarkable fact that this newly-discovered use of cold water directed the attention of many to the temperance movement, and caused them to regard with greater attention the simple power of water, as contrasted with the baneful and demoralising influence of intoxicating drinks. Many have not only visited the hydropathic establishments with benefit to their health, but have also become convinced of the truth of temperance. In many countries establishments were founded on the principles of, and greatly resembling, the [illegible] establishment at Grafenberg, among which is the celebrated [illegible] establishment, near Richmond, conducted by Dr. Ellise, who studied under Priessnitz.

Priessnitz became a wealthy man, and the happy father of a

family of ten children, of whom, however, seven are only at present alive. His wife was the reward of a successful cure, for he was so fortunate as to relieve her mother from an affection which defied the power of the physicians. Although Priessnitz was, on one hand, the object of bitter persecutions and incredible instances of unthankfulness, yet on the other hand, he met with the delights of innumerable unexpected attentions and the acknowledgments of grateful persons of every description. The neighbourhood of Grafenberg is full of monuments of overflowing gratitude, and in 1846, the breast of this renowned man was decorated with the golden medal.

Outwardly, Priessnitz impressed the observer as being a simple, benevolent and strong-minded man. The evidences of knowledge, but great general information, which he had gained by his intercourse with educated persons of all countries. Whoever knew him intimately felt himself attracted magically by him. His conversation came from the heart; his character was of an iron determination. Neither praise nor enmity could move him, and even unlooked-for wealth did not destroy his activity. He lived to alleviate the sufferings of humanity, and the immortality of his name rests on his successful struggle with mortality. In cold water he raised a monument which will be more durable than one of stone. Priessnitz's death was in itself most remarkable he who had snatched so many by the aid of water from the arms of death, fell a victim to dropsy. He died November 28th, 1851, from affection of the liver, which

VINCENT PRIESSNITZ.

a deep thinker and acute observer were distinguishable in the singular expression of his light blue eyes, which seemed the reflection of an unspotted soul. His replies to questions were given with his mouth half closed, in a very agreeable but rather low voice, and no sooner had his laconic but expressive words left his tongue, than his thin lips closed firmly together, and formed round the clearly-defined mouth very singular wrinkles, in which, probably owing to a natural difficulty of keeping his lower lip closed, some little exertion was visible; all this, together with his striking nose and the marks of the small-pox visible in his face, gave him a very peculiar expression. In public life he was simple, but rather reserved and laconic; in private, however, he was cordial, he possessed no scientific

when associated with dropsy is invariably fatal. The physicians who were present, with many of the hydropathic visitors at the *post mortem* examination, expressed their surprise that Priessnitz could have lived so long with such a liver, and declared that this extension of his existence could only be attributed to his peculiar mode of life. This disease may also be considered a consequence of the accident which nearly proved fatal to him in his youth. Priessnitz lived and died in the exercise of his mission, and few men have been more generally regretted, or more tears of sorrow shed for any one than for Vincent Priessnitz. From the highest to the lowest sorrow was felt, and a great multitude followed his remains to the grave, as they would have followed those of a beloved father.

THE HOUSE OF SALVATOR ROSA AT ROME.

The dwelling-places of the poets, artists, and great men of the past exist, like their works, long after their material bodies have passed away. Man perisheth, but the labour of his hands endureth for ages: the pyramids remain, but the names of their builders, and the very purposes for which they were built, are forgotten and a mystery. It is a solemn thought. Go wherever we will where men have congregated together and we shall find evidences of their former lives, but of the men themselves no trace remains. One makes himself famous among his fellows by valiant deed or spirit-stirring song, by noble ambition, by great crime, or by transcendant powers of mind; he lives his appointed time on earth and then dies; henceforth the spot that gave him birth, the city in which he sojourned, the grave in which his bones

lie buried, become ennobled to the memory of all future men. And thus the traveller, without perhaps knowing why, and without caring to analyse his feelings, seeks out the birthplace of a Tell or a Hampden, the dwelling-house of a Shakspeare or a Tasso, the tomb of a Virgil or the grave of a Bonaparte; nor goes upon his way contented till he has stood and pondered on the very spots with which these great ones of the earth were once familiar.

In every city, and almost every village, in Europe, are to be found some remains of their celebrated men; but most of all in the old classic cities of Italy and Greece. Here the student may revel in the past, surrounded by the evidences of its glory, in marble statue and pictured canvas; and here, too, he may trace out the actual houses in which the memorable men of ancient days both lived and died.

It was in Rome that Salvator Rosa passed the last years of his life, surrounded by all the celebrated men of his age. His story is interesting. He was the son of an architect of Renella, in Naples, was born in the year 1615, and was brought up under Francesco Francanzano, a painter, who had married his eldest sister. For some time this young artist was obliged to sell his drawings about the streets for a livelihood. One of these happening to fall into the hands of the famous painter, Lanfranco, he sought out its author, and enabled him to enter the academy of Ribera. With this painter Salvator lived till he was twenty. At that time his father died, and he accompanied his master to Rome, where he continued four years, and found a patron in Cardinal Brancacci, who took him to Viterbo and gave him employment. After this he returned to Naples, but the attractions of Rome drew him thither again, and he there became known to Prince Giovanni Carlo de Medici, who took him to Florence with him. Here the painter remained nine years, dividing his time between poetry, painting, and music. Not only did he excel in painting, but he acquired no small renown by his verses, which were full of humour and satire. He is said to have been very fond of a joke; the painters of Rome having at one time refused him admittance into the academy, he on the anniversary of St. Luke contrived to place a caricature of his own in the church where the paintings were exhibited. However, he concealed his manner, and afterwards said, that "it was done by a surgeon, to whom the painters had acted very ill in refusing a place in their academy, though they stood in great need of one to set the limbs which they daily dislocated or distorted." Another time finding a harpsichord on which he played good for nothing, "I'll make it," said he, "worth at least one hundred crowns." He then

painted on the top of it a subject, which when offered to a picture dealer, immediately fetched the sum he mentioned. Many other similar anecdotes are related of him.

After a long residence in Rome he was attacked by dropsy, and died in 1673. Although the genius of Salvator Rosa principally showed itself in small paintings, he filled one of a large size with sublime figures, such a one is the "Conspiracy of Catiline," in the gallery of Florence. His great excellence, however, lay in depicting scenes of gloom, solitude, and desolation—sombre forests, or the caves of banditti—rocky dells, alpine bridges, trees scathed by lightning, and dark and lowering skies. His figures are generally wild and savage. He painted sorcerers and apparitions, of which kind the principal one is the witch of Endor. We have mentioned that Salvator Rosa was a musician, and in 1770, some of his manuscript compositions were sold at Rome by his great-grand-daughter. The landscape in the National Gallery by this famous master, formerly graced the Colonna palace at Rome. It was purchased by the English government in 1821, of Mr. Byng, at the price of £1600.

Our engraving represents the house in which Salvator Rosa died at Rome. It was built at the time when the false style introduced by Boromini was most extensively adopted throughout Italy. It is a curious example of the excesses which architectural eccentrity may be carried, and no doubt the architect believed he had attained a great triumph when he gave the semblance of huge gaping mouths to the windows and gateway. It is an example of the low ebb to which architecture fell at one period, but still is highly interesting from the historical associations connected with it, and for this reason only is it introduced into our pages.

THE ORIGIN, CHARACTER, AND DOINGS OF THE ANGLO-SAXONS.*

THE Frenchman exalts his beloved France — the German his fatherland—the Englishman loves old England, and seems to feel that verily we are the chosen—we are *the* people. To some this may appear somewhat vain-glorious, and it would be so if facts did not bear it out. There never was a nation in the world that had and has such work to do; even our language is becoming universal. In former times it seemed as if French would be the prevailing tongue. It is not so now. Our language extends over North America, South America, Australia. Wherever the Saxon goes he carries his manners and customs with him, remembering this, that the waste places of the earth are given to us—we are now reaping the benefit of paying the penalty for what our fathers have done. The life of a nation is continuous. The water in the Thames is different from the water flowing at any particular point there seven years ago, it is influenced by certain changes which have taken place higher up, nearer its source, yet is it Thames water as much as ever it was, the river is the same. It is not the living in the nation who make the nation, but all who have ever lived in it. We hear a great deal, in this our day, about progress, enlightenment, change; lay not too much stress on this. We are as our fathers were; no culture wears out the characteristics of nations; the Jews are the same now as they were hundreds of years ago. It is the same in families, no family ever loses its likeness; every child is like his ancestor, not perhaps his mother or father, but a grandfather, or an antique great grandfather, comes out in him. This is no novelty, but merely the expression of an historical fact.

God made nations separate, distinct, peculiar; nations are great individualities of character. Not to treat of this antiquarianally, I may state that the Celtic wave first flowed over Europe westward, reaching England and Ireland; in Wales and in the west of Ireland they are not yet extinct. We belong to the second great wave of population that rolled over the west,—namely, the *Teutonic*. The third is the Sclavonic, they will not reach us—there is nothing new in them. In the Holy Scripture the patriarch who had gone down to Egypt gave the two boys of Joseph his blessing; the best was given to the younger. The Jews thought primogeniturship was divine—nevertheless the old patriarch would bless the younger lad. God gives his blessing this way sometimes, and by blessing the Saxons he has made of them a great nation. Abraham was called because he was worthy. The Teutonics were a goodly race, and, under the favour of the Almighty, they have prospered from generations back to the present day. Tacitus says they must originally have sprung out of the ground. They came like grasshoppers, and seem to have risen from the land. They were bold, plucky, not easily governed, and could brook no personal restraints. "Hands off!" was their motto. Twenty-five of them once committed suicide rather than become the sport of the Roman nations, they fought in clans. I am a large believer in clans, and have great respect for that bond of brotherhood which formerly was practised by our ancestors. They were largish eaters, but no great epicures; great in quantity, not in quality—great also in drinking, and fond of the excitement of gambling. They thought it the part of women to weep for their friends—men to think of them. An Englishman can't weep. Catch him doing something like it—tax him with it—"no, he is not crying; true, there is a tear, but it arises from a cold—a fly—anything rather than an acknowledgment of the fact. Frenchmen kiss one another—first on one cheek, then on the other, finishing with a kiss on the middle. We don't. We give each other a great grip of the hand, and say we are jolly glad to meet, and although we may not meet again for years, who shall estimate the amount of love and friendship in that short sentence—that firm grasp! I never heard a great foreign orator without thanking God he was not an Englishman; it is all very well in his own country, but it does not do in England; it is like our orange trees—out of place. The foreigner has more demonstration, less depth, deep friendship often has but little show. When I am *told* of loving much, I don't believe it. Heart-breakings are not to be noised abroad, things are never at the worst when you can say they are. When the child cries and roars, it is safe, no harm will be done, a little time will make it all right. The disconsolate widow, who has lost the best husband under the sun, is inconsolable, her grief is great, but she *tells* me so, soon after which I expect to hear she is comfortably married.

The Saxons were very hospitable, they were of the free-and-easy sort, you were at home with them, and did what you liked. They held the fair sex in high estimation; they advocated woman's freedom, not rights; and they understood woman's position, and were more influenced by woman than were the Jews. The Saxons believed that women have an inherent divinity. Those notions may have gone out now, and woman is thought to act her part best at home. Our ancestors thought otherwise. Women are quick and ready, usually right. Men arrive at conclusions by long reasonings; women without any reason at all. In those days the women were frequently used as hostages—for this reason that every exertion would be called into play to redeem them. To love the Saxons, they were true lovers of liberty, and we inherit this characteristic. We admire King Arthur, but take the side of the Saxons; the Britons were driven out—it was fatalism—whoever goes, ought. The Britons ask aid; the Anglo-Saxon comes puts his foot in; give him a bit of land, he soon builds a factory and after he has the factory he will next want the kingdom, and he will have it, too. A man in a drab coat gets in the thin end of the wedge somewhere—drives it home—and, finding it desirable and pleasant, settles there himself, and soon begins to look out places for his family; cousin after cousin comes to join him, and we soon have a Pennsylvania. The old Britons were driven out the proper time had arrived, and at last England is Saxon. The next great change is the conversion to Christianity. A great pope St. Gregory, sent missionaries hither. His attention was roused to the dark state of affairs in this country by observing, before his elevation to the papal chair, some slim-limbed youths for sale in the slave market at Rome. He went up to them, and inquire about their country. He was pleased with them; and, finding they were English pagans, he said, in the Latin language, *Non Angli sed Angeli, forent si essent Christiani*—"They would not be Angles but angels, had they been Christians." Satisfied with this pun, he ventured another, evidently relishing the pious joke. He tried another question, concerning the province from whence these captives came, he was told. Deiri, a district of Northumberland. "Deiri," echoed he; "that is good; they are called to the mercy of God from his anger (*de ira*)." He was so much gratified

* The substance of two Lectures, by George Dawson, M.A., delivered at the Whittington Club.

this, that he tried again. "The king of that province, what is he called?" He was answered, "Ælla, or Alla." "Allelnia!" cried he; "we must endeavour to have the praises of God sung in their country." This good old man thought that where the body was so fair, the soul must be like unto it. This notion he never could get rid of, and having got over his disease of punning, he started for England; but before his plan could be fully carried out, it was put a full stop to by his being sent for to return to Rome, and to be made pope instead. This he did unwillingly. He wished to convert the English, but he could not put it in practice. He did, however, what he considered best on the occasion. He sent a monk hither, who took up his abode in Kent, preached with success, and made many converts to the new faith. Whether this was done according to the modern notions of conversion entertained by some sectarians or not, it is difficult to say. However, many were converted. The first that spoke on the subject was the high-priest; after he had finished, a layman got up and said "that the life of man seemed like a bird in a dark room, it took a turn or two, and then went into the darkness again. If the monk could teach him any better, he would have the new faith." Our forefathers now became very pious, they worshipped all the saints, and were very devout, indeed, but they did not like taxes Notwithstanding this, the Roman faith made good way with the Saxon people. These very people made famous protestants afterwards.

We have always been of a very composite character—a something between the domesticated and the wild man. Go to the top of the Pyramids, you find an Englishman, then he is soaring away, far over head, in a balloon, the next time you catch a glimpse of him, he is down in a Cornish mine, in fact, he is everywhere the wild pluck within him is ever in search of danger and difficulty.

We make a plaything of the sea. An Englishman likes the sea, the brine is delicious; and he goes to seek it the fun of it The Saxon, Dane, and Norman all come from one race The time was now arrived for the Danes to pay us a visit. These Danes were a warlike people, who always preferred a battle to their mistress, and he was considered a weak man who did not see the fun of tossing children on spears for amusement The Scandinavians did not like it. The Dane came, and the Saxon fought The Dane conquered, took the Saxon under his protection, who down hereupon quietly as a country gentleman Sir Walter Raleigh and Sir Francis Drake are part of them Nelson is one of their old thanes, with an admiral's coat on He thoroughly proved sea-loving, Scandinavian. The Saxon was sluggish, lazy, like his oxen—slow; could get through with a lot of work, but must have time, and a plenty of it. The Dane stirred him up. The Danes took all strangers that came. Alfred took them in certainly, and later down one other, the Norman William, since which time there has been no such conquest We sympathise with Harold, on that battle-field of Hastings, but he was not to succeed. The Normans were more clever and polished than the Saxon or the Dane The talk of England to day shows token of the Norman The word *bacon* is alike both in Saxon and Norman languages. The word *king* was retained by William. All courtly phrases were Norman; homely, Saxon; for instance, the names of animals still used for food are Teutonic, such as *ox*, *sheep*, *swine*, &c The Norman conquerors, introducing a more refined style, cooked the animals, and changed the names to *beef*, *mutton*, *pork*, &c We always admire the good old Saxon words, and plead guilty to preferring John Bunyan to Addison or Johnson, fancy the book of Job edited by Johnson, or the Psalms revised by Addison Saxon words were the growth of the soil, and those little words are powerful much more so than the long ones. When the Norman came, the sun and moon did not change, they are the same to the conqueror and the conquered. But what good did William do us? The Normans had more wit than those they came among; one had more science than the other. The Saxons were admirable fellows, no doubt, but slowish. William was clever—a lightweight—and had to make up the deficiency by skill, acuteness, learning, and science. The Norman William leaped on the back of the Saxon, and the latter has been trying to throw him off ever since—the few against the many—aristocracy *versus* democracy, out of this sprung free-trade—one of the old questions—the old story; but we beat, and had the thing conceded; it was gripped out, wrestled for, and won. Our energies are gathered up by the very weight placed on them. English history is a long history of antagonistic forces. If William had not come, England would have degenerated. Had not William arrived, and helped by compression to knit the nerves, we should not have been equal to the struggle. Victory has generally been on the right side. When I turn the annals of my country, I am glad that William came, and placed that antagonistic force on us by which all our liberties have been brought about

Our seas have done us good, and kept us at home; we were like so many cottages hedged in by strong palings; William took them down, and showed us the continent beyond. We have never been conquered since, God's work was done. We have found a resting place—an harbour of safety for a few foreigners, on various occasions, and we have learned much from them The cry is, We can't do anything, we are bad at accomplishments, but these bold, brave, resolute men construct railways, build viaducts, launch [illegible] commerce and civilisation over distant lands Some [illegible] Saxon to the Americans, but what is America? We threw it off, and by-and-by it will be greater than the land which nurtured it. The sturdy strength we have, is a grim reality, showing itself in large, broad, strong, energetic works. In this particular our offsprings tries to follow our course. America is but Jonathan, the son of John; nothing more.

Every man comes into the world with destines in his nature; he is here for some purpose The Englishman is a composite creature, made up of Saxon, *plus* Dane, *plus* Norman. Let us now see what facts have been produced by this people. Trial by jury originated, not in the profound respect entertained for the united brains of twelve enlightened, or otherwise, individuals, but more in the endeavour to protect the people in the welfare of each other. That Alfred first called trial by jury, is nonsense. The old custom was to get twenty upright and honest men as witnesses on behalf of the accused, after which the verdict was given. To keep the person of the Englishman inviolate, we worship law—one like our's, with two feet, is a wonderful persuader He who makes a law is likely to keep it, and the best way to make good laws is to have the greatest number to make them; the freer a country is, the more the laws ought to be respected Liberty and license are two very things, half-a-dozen men, sitting round a table, may get drunk—very drunk. The head of one suddenly disappears under the table, whilst the legs of another are on the table; one suddenly feels inclined to propose a toast, and, having done so in an unknown tongue, is trying to find his glass, but, somehow, the decanter always comes to hand instead. Thus would be license, but not much liberty, certainly

Laws made by the people should be kept by the people: republics need the keeping the laws most. We have inherited from the Saxons the largest possible amount of healthy feeling on this point. We have the best circulation of any European body, the body, when troubled with a rush of blood to the head, is in a dangerous state Some of our neighbours are often afflicted in this way, and the natural consequences follow. As it is said that in a rude state of health the blood circulates freely in the most distant extremities, therefore have I a respect for a parish-beadle when I see him anywhere, even at the extreme end of Cornwall, for he is to me the rosy finger tips of good health, he shows us the evenness of culture which we possess; we are not happy without the whole of the country is in a healthy state London is not everything The greatest political questions of the day spring up in the country. They are sent to London to be settled, but the battle is fought, the struggle is made, in the country Manchester organises a scheme, and sends it to London to be sanctioned, and by-and-by the whole thing is finished. London is too large to be united, it is more like a number of small towns, without unity, the man of the west is not known in the east The interest of one has nothing to do in common with the other. London is certainly a mighty city, but it is not all in all, it wants help from the country. This is as it should be, and shows good, healthy, circulation, an evenness of political power. In the country we appoint mayors—we owe this to the love of local self-government. A great deal of talk has taken place on the policy of establishing a national poor-rate. This is not the place to agitate such a policy. Time will probably determine the question.

Protestantism had a great deal to do in making us what we are, both socially and politically. Wherever protestantism flourishes, that is a money-loving, money-begetting country. Protestantism has to do with the life that now is, the catholic religion, the life that is to come. Protestantism has to do with the natural

order of things—a protest against fastings, and such like. The reformation was ushered in by the study of the old classics; this had for its claim state, time, body, matter; the other form, priest, church, next world, and spirit. The puritan does not dance; a theatre is an abomination; card-playing, diabolical; cricket, dangerous; he keeps his Sunday sadly, grimly, dismally; but he is a capital money-getter—a quick and acute tradesman. Puritan notions make people comparatively careless of personal comfort. A puritan party is a most dreary assembly—amusements have no place there—*they don't do it.* After sitting nearly a whole evening looking at each other, family prayers come in, to break the monotony, and the whole is over. Now this energy, not given to enjoyment as rational beings, must go somewhere, and it may be found on the exchange and the mart. In this country the most successful people are the puritans; the presbyterians from the north; the quakers from the south; protestantism *plus* puritanism is sure to make a country rich. The more puritanical a nation, the richer will it become. The English took to protestantism kindly; it has never found such a home as this. The countries which were catholic at the time of Luther are catholic still; protestantism only flourishes in the Teutonic. A quaker is a phenomenon; he has no clergy, and believes in the universality of spirit, entering either man or woman. Each member is a chapel in himself. There is no such liberty anywhere else; it is only grown in Teutonic countries. In Russia it is not allowed; no new sects can flourish there. Two sects may marry, and thus be dragged into the most unholy matrimony. The emperor of Austria says they have sects enough, and he puts his *veto* on the introduction of any such luxuries as small conventicles; they have enough, and must have no more England is the only country in which these New Jerusalems, Primitives, Ebenezers, Zions, Bethels, and Beulah's flourish. Call them what you will—warts, specks, diseases; rave about them as we like, it is only here they exist. Good people, steady church-going followers, sometimes tell me they never entered such a place in their lives, and would be much shocked if they were accused of such a thing as walking into a meeting house. This is not much to their credit they live in a country without knowing the religion of the inhabitants. I have visited every chapel, and heard a sample of all the creeds, and a precious sample I sometimes had, but this is the only way to know what they all believe, and what the country can produce. I honour these earnest men, with their large liberty of speech, and these primitive ranting-places Anything or anybody interfering with them, is treason to our fathers.

The next great thing to notice is our colonies. Within itself, England is comparatively small in extent and population, but when we look round the world, and note her dependencies, what a people! Our population is scattered all over the world. Look at New Holland or at Anglo-India, nine times the size of Great Britain, and containing one hundred and forty millions of inhabitants. Of these sixty thousand only are English. How did we get India? We will not impeach Warren Hastings again, nor enter into the history of the question; if there was anything wrong about this Indian affair, we must pay the penalty. Our forefathers draw bills on us, and we must take them up. There never was a case of so many people being governed in such a manner in the world We ought to look to it, and send from this country all that freedom and education can bestow. These people are not savages; they are the most enlightened of all our colonial possessions. Why, in the Glass house, last year, they beat us in many things; we there saw beautiful articles designed with good taste, and executed with consummate skill—the work of our subjects in the east. The Indian question has always been a tender business. God has put his mighty empire under our guardianship; if we don't do the right thing with it, we must take the consequences.

The Greeks and Romans sent out colonies; but no nation except England ever before gave a nation birth. The Americans are a nation, with no language, no creed, no grave-yards; their names are a derivation, and it is laughable to see the pains an American takes to appear national. He will soon explain to you that he is not an Englishman, but a free-born citizen of the United States, with a pretty considerable contempt for them Britishers. These notions make an Englishman smile. The Americans are a nation without being a nation; they are impressed with an idea but they have characteristics. They are odd, not national, and remind one of a long, slender youth, somewhat sallow, who has just had a new watch, consequently dislikes the old one; and as for the watch his father used, what is it?—a turnip. By this means, he assumes the independent. The American is independent; he flaunts it in your face, and surprises you with his galvanic attempts at showing off his nationality. They have, in fact, no literature, and don't want to have any as they can draw from the old country; the feeling is should be cherished; it is like the boy at Christmas coming home to spend the holidays. Long may they draw inspiration from Shakspeare and Milton, and come again and again to the old well. Walking down Broadway is like looking at a page of the Polyglot Bible. America was founded in a great drought, peopled through liberty; and long may that country be the noblest thing that England has to boast of.

Some people think that we, as a nation, are going down; that we have passed the millennium; but there is no reason in the saying. We have work to do, gold-mines to dig, railways to construct. When all the work is done, then, and not till then, will the Saxon folk have finished their destiny. We have continents to fill yet. Our work is not done till Europe is free. When Emerson visited us, he said that England was not an old country, but had the two-fold character of youth and age. He saw new cities, new docks, a good day's work yet to be done, and many vast undertakings only just begun. The coal, the iron, and the gold, are ours; we have noble days in store, but we must labour more than we have yet done. Talk of going down; we have hardly arrived at our meridian! We have our faults; any Frenchman or German may point them out. We have our duties, and often waste our precious moments by indulging in one eternal grumble at what we do, compared to what we ought to do. A little praise is good sometimes; we walk the taller for it, and work the better. Only, as we know our work here, and do it as our fathers did, shall we promote good, working heartily, and not faltering, until the object is gained. The more we add to the happiness of a people, the more we shall be worthy of the good gifts of God.

THE POWER OF THE POET.

BY THOMAS MOORE.

Mine is the lay that lightly floats,
And mine are the murmuring dying notes,
That fall as soft as snow on the sea,
And melt in the heart as instantly

Mine is the charm whose mystic sway
The spirits of past delight obey,
Let but the tuneful talisman sound,
And they come, like genii hovering round

And mine is the gentle song that bears
From soul to soul the wishes of love,
As a bird that wafts through genial airs
The cinnamon seed from grove to grove

'Tis I that mingle in one sweet measure
The past, the present, the future of pleasure,
When Memory links the tone that is gone
With the blissful tune that's still in the ear,
And Hope from a heavenly note flies on
To a note more heavenly still that is near.

BILLINGSGATE.—Billingsgate, at one time rivalled by Queenhithe has been a fish-market for centuries. In 1558 it was declared "a open place for the landing and bringing in of any fish, corn, salt stores, victuals, and fruits, (grocery wares excepted,) and to be place of carrying forth of the same, or the like, and for no other merchandizes." Stow says, "Geffrey Monmouth writes, the Belin, a king of the Britons, about four hundred years before Christ's nativity built this gate, and named it Belin's gate,"—but he suggests that it more probably had its name *from* some late owner. The market begins at five o'clock in the morning, when the scene is worth a visit. Of salmon alone, the quantity annually brought to Billingsgate is said to be more than 2,500 tons. The frequenters of the place have, or rather had, a language of their own, which made "Billingsgate" and "coarse words" synonymous. Improvement in this respect is observable, and the new buildings, suggesting notions of respectability, decency, and order, will, it may be expected, complete the cure.

HOW CHARLEY BELL BECAME AN M.P.

The whole matter is this.

The tea things had just been cleared away, the baby just got fast asleep, and laid in his crib, my wife just seated herself by the round table making a blue velvet cap for him, and I had just got comfortably settled in my arm-chair on the other side of the table when Tom returned from the office through the rain and mud and dark, bringing a letter. My wife smiled slightly when I told her it was not from her mother, but apologised immediately when I informed her that the letter—broad, thick, and with a vast deal of ink in the superscription—was from Charley. Giving the wick of the lamp another turn, she begged me to read it aloud.

Tearing off the envelope—drawing my chair a little nearer the fire, and clearing my throat, I read—

"Rev. W——.

"My dear W.,—Elected! Apart from all nonsense and affectation, I am heartily glad of it. Of course I received the congratulations of everybody here quietly, as if it was all a matter of course that I should be elected, but with *you* I have no reserve. Know, then, my *very* dear W, that I am glad I am elected for three reasons. First, because I am elected while barely of the requisite age; secondly, because I am elected by an overwhelming majority—twenty to one; thirdly, because it places me out in a free and higher field of usefulness and energy. Why, I feel as if I had just begun my life. I have not attained the *end*—only the beginning—of my ambition. I don't think that it ought to be branded as *ambition*—this feeling of mine either. I *don't* think it is ambition. It is a purer feeling—a wish, an eagerness, a *nature* to be doing, influencing, bettering as wide a sphere as I possibly can. I was elected without any *art* on my part whatever. I told the people exactly what I was, and what I intended to try to do if they elected me. I intend to be just exactly what I am. If I were to try to appear other than exactly *that*, I would look as well as feel mean—my arm would falter in every gesture, my tongue stammer, my knees shake—I would become weak—weak physically, mentally, utterly! A pure-minded, single-intentioned, whole-souled manner, in thought, word, and deed, has borne me thus far like a straight arrow from a true bow. It is the shortest, best way to cleave the future, I know.

There is a fourth reason why I do rejoice in my election——because I know that *you* will rejoice in it. It is *you*, my friend, who have made me high-thoughted and far-thoughted. It is *you* who during the last twenty years have been my good genius—in your conversation when present with me—in your correspondence when absent from——"

I read the rest of the letter to my wife, but it is altogether too flattering to me to be coolly written out here. Indeed, I remarked all along, through the three more pages that followed, to my wife, that his encomiums were only the warm expressions of a warm soul unusually excited, and which must be taken with all allowance.

Charley's letter flushed me through and through. That my old friend should be elected, I hoped, but hardly expected. Intimate companionship with a friend, you know, has a tendency to dwindle him in our eyes. Don't misunderstand! Intimacy with such a man as Charles Bell makes one love and prize him more and more—but does *not* make one think more and more that such a man is suited to be a grave and reserved senator. It is just as it is with the Swiss peasant whose cabin is on a side of Mount Blanc—the hoary mountain does not seem a tithe so sublime to him as it does to a traveller in the distance.

I say I felt thoroughly warmed and rejoiced. I arose, put all my wife's spools and scraps off the table into her lap, laid my portfolio and inkstand upon it, begged my wife to absorb herself in her baby's velvet-cap, dipped my pen in the ink, and now have written thus far.

All my past intercourse with Charley rushes to my lips now, as tears do sometimes to one's eyes. I want to tell, just as briefly and distinctly as possible, how he has risen from nothing to what he now is. I know much better than he—and if he reads this, it will do him good. Anyhow, I feel in the mood of writing, and before I go to bed, if my baby don't wake with the colic, and my wife don't interrupt me, I will tell you exactly how Charley Bell became a member of parliament.

The fact is, too, that I have half a hope that some youth may read this, and may get a word which may wake *him* to a higher and nobler life than he has ever yet dreamed of. If the eye of any such a one rest on these pages, just one word, my fine fellow. Forget for a little while that everlasting Julia whom you fell in love with last Tuesday a week ago, and read with all your soul.

I cannot describe [illegible] when I did not know Charley. He is a——ed did when we used first to chat cosily beside his fireside about Bulwer, and Dora Anson. He is of medium size, handsome earnest face, forehead broad rather than high. There is a peculiar gentlemanly look about him, wherever he is, or whatever he is doing. He has such an enthusiastic sympathy for every man, woman, and child he meets with, that he is popular of course.

His peculiarity, however, always consisted in a hunger after personal excellence. From our first acquaintance we made a distinct arrangement to tell each other of our faults as plainly as words could convey meaning. If he did not faithfully do his part toward me in this arrangement, I am very, very much mistaken. He thought *aloud* about me—told me exactly what I *was*, and what I was *not*. I did the same in regard to him. We have acted thus for many years now. We have been of vast benefit to each other, and will continue to be so till we die.

I do verily believe that this arrangement had a good deal to do in making him the man he is.

Just in this way.

When we first became intimate, and had made our arrangement as above, I opened the war by talking to him as follows:—

"Charley, my fine fellow, you are ambitious to be a good speaker. Now, you remember our little arrangement about correcting the faults of each other?"—"Yes."

"Well, the plain fact is, you have got a most miserable, squeaking voice. Your chest is narrow, you stoop, and you have not that broad, strong, manly appearance which is most essential to a speaker."

I saw he winced under this. He *felt* eloquence deeply—he *thought* eloquently—and forgot that the thought must be *expressed* eloquently, or it is eloquence only to himself.

That afternoon he made a pair of dumb-bells; and I do verily believe that he has not missed a day from that to this in which he has not exercised his chest and his voice in every possible way. No one would ever think *now* that he was not always the broad-chested, powerful-voiced orator he is.

It strikes me that even this little event had something to do with Charley in his becoming a senator. You never saw a narrow-chested man who had any voice, energy, or eloquence in your life. If *you* have got a stoop, my boy, you had better correct it, if you ever intend being anything.

I received from him one day a very, very plain exposition of one of my many faults. Never mind what it is. He pointed it out to me as you would point out a rattlesnake in a thicket to any companion you chanced to be walking with. I saw it—this vile fault of mine—and have been hunting it, and striking savagely at it, whenever I detect it stealing through my conduct with its accursed sidousness ever since. Alas! it is "only sketched, not killed" yet. But that is another matter. I only mention it to say that a very plain remarks gave an edge to *my* remarks, as I observed—

"You are right, Charley—perfectly so—and I war against that accursed fault forever. But it reminds me of one of *yours*."—"Eh?"

"Charley, you have a vile, offensive, disgusting habit of smoking tobacco. It is loathsome. If you would only keep the weed in your mouth, why it would only poison yourself, but you will be everlastingly spitting out its juice, and it poisons *me*—poisons me through sight, smell, hearing, and feeling. Don't use it any more."

True to his own true nature, he never took another cigar. Whether this is one cause of his blooming health and firm nerve, I will not say. I *will* say that it is one cause of his astonishing popularity with the ladies—whether *they* know that it is or not—and thus one cause of this election.

These faults of ours! I said they are like snakes. So they are. Sometimes a man catches sight of one of them lying full-length in the loathsomeness in his own conduct or conversation. Suppose the fault is self-conceit—a disease of mentioning one's self at all times which you have contracted. Well, you see the same fault in some fool or other, or some Charley Bell tells you of it. The knowledge falls like a flash of daylight on the vice—you see it. If it would only perish—crawl *out* of you—it would be well. But the vile thing crawls *into you*, like a snake into its hole. It does not show its head while you are watching for it. A day or two after—you forget about it—and it is out—drawing its filthy train through all your conduct again.

This is *not* a digression. Because I wanted to say that Charley was a man of too strong a desire after personal excellence not to wage eternal war after such vermin. A shrewd observer would have known the existence of his besetting faults only by the unusual prominence of just the opposite virtues, just as you recognise the former drunkard in the man who has a special horror now of all that can intoxicate.

There were several minor defects in Charley's character, which I pointed out to him, but which he has so completely conquered, that I have forgotten what they were.

I really must say a word or two about that Dora Anson affair. Dora was the brunette daughter of an established lawyer in our inland village. I see her as distinctly before me while I write as if she *was* before me. She was some sixteen years of age, had the usual amount of education and *mind*—was unaffected, warm

hearted, black-haired and eyed, rosy-lipped, woman-rounded form. Charley fell in love with her—astonishingly in love with her. I was amazed. He was of an intellectual, though impulsive nature, and she had no conversational power—nothing in the world but a lively, natural sort of beauty—to recommend her to him.

Astonishingly in love. He made love to her by flowers, and was accepted in the same way, before he went to college. He was absent a year. The very night of his return he went to a party at her father's which happened that night. He got a seat near her toward the close of the evening—in a low voice made a passionate appeal to her, although surrounded by company—went home—wrote her a still more passionate letter. He was too impulsive—frightened her—had his letter returned—and came to me, and, as we sat on a log in the moonlight, told me the whole He was about twenty years old then, and the affection had quickened, expanded, strengthened his heart even more than that chest-exercise had his lungs There was a depth and breadth and force about his affection for Dora which stirred up his whole being. It rolled through him like a sea, deepening and washing out the sands of his heart till that heart became deep and broad. For months that love lived and worked in him, at last it died out like the steam from the engine of a steamship

When I see his hearty affection for his friends—his warm sympathy for all among whom he mingles, which gives him his wonderful popularity—I can trace it all back to that development of his heart under the hot summer of that love of his for Dora Anson I do believe that the genial smile, the cordial manner, the melting persuasivness of his tones, all owe their development, if not their origin, to that culture of his heart. The sun may have set which shone on his soul, but it left that soul all ruddy and ripe from its warm rays If Dora had jilted him, it would have left him a soured man; if she had married him, it would have left him a satiated man; in either case it would have injured him. But she did not jilt him—did not marry him, he outgrew so sensuous a love as that, and somehow or other they drifted apart

I believe, however—and my wife, to whom I have just mentioned it, agrees with me—that his connexion with Mr Nelson had very much to do in making him the man he is

You see, when Charley had finished his law-studies, his father and mother were dead. He never had any brothers or sisters One or two thousand pounds were his fortune Being a young man—now some twenty-five—of fine appearance and talents and manners, he attracted the attention of Mr Nelson, a keen and rich lawyer in the village, and in a few weeks he was settled in his office as a junior partner. For some six months Nelson seemed wonderfully attached to Charley—continually spoke of him with the loudest praise—over-rated him in fact At the close of this period, however, he suddenly took just as violent [illegible] Bell as he had before for him Nobody ever knew the reason of this I don't think Nelson himself did The truth was, the elder partner was a singular man He always dressed neatly in black—was rather thin, with a stooping shoulder, retreating forehead, a quick way of talking, and a rapid step He was [illegible] hospitable and generous, more for the sake of being [illegible] protector and superior of the guest than anything else. [illegible] trait of his character

But I am writing about Charley, and have got no time to paint this Nelson. Enough to say that he took as vehement a dislike to Bell as he before had a liking. He ridiculed and opposed and thwarted him with an astonishing bitterness. Bell at first was staggered with astonishment—then cut to the very soul with such unkindness from the last man on earth from whom he expected it But it did him great good. It corrected his blind confidence in every man completely, and gave him a quiet watchfulness of men in all his dealings with them, which was of immense benefit to him It destroyed in an instant all his false and coloured ideas of things The faults of his character which Nelson pointed out and ridiculed, and made the ostensible cause of his alienation, were for ever corrected, just as a wart is burned off with lunar caustic. Nelson's extravagant depreciation of him, after such extravagant praise of him, gave him, in one word, an impulse to prove himself unworthy that depreciation, and more than worthy the former praise, which did more for him than if his senior partner had given him years of the most careful instruction and countenance. Besides, it threw him suddenly on himself—made an independent man of him for ever. Just what that chest exercise did for his lungs, that Dora affair did for his heart, this Nelson matter did for his will—it deepened and broadened and strengthened it to an unusual degree—it did very much towards making him a senator

My wife agrees with me that the little love affair of his with Marie M'Corcle had not much if any effect on our friend Falling a little in love with her when he was some twenty-six years old, for a remark she made in a speech when May Queen, he proposed in a note—was rejected in a note. Mounting his horse, he took a ride of some eleven days on business somewhere Or his return he was over with it, except of course the feeling of pique. The first day of his ride, he chanted, as he told me, the words of her rejection to an old tune, all day long, over and over and over. The next day it was to a faster tune. He trotted his horse rapidly back, making his hoofs keep time to the swiftest jig of his recollections as he rode into town with the words of her rejection still on his lips.

The rest of my task is a pleasant one. I like to think about Annie Rennaugh—I love even to write her name. She was a cousin of Dora's, and resided in the same town. I cannot say that she was pretty, but I can say that she was beautiful. Just in this way. She was of a small, modest, quiet appearance. You would hardly look at her twice if you saw her in a promiscuous company. Only become acquainted with her, however, and an irresistible charm is upon you. There is such a delicious ease in all she says and does—such a deep mirth and artless confidence in her that conquers without observation

She was a special friend of Charley's He confided to her from the very first all his affair with Dora. I saw him one evening at a party with her She was seated in a chair by the door, with a saucer of strawberries and cream in her lap He was seated by her side in the doorway—enjoying the summer air—conversing in a low, earnest tone with her. They were talking about Dora—Charley's *ideal* Dora—as earnestly as if they were talking love on their own account.

Well, the full moon of Dora's influence waxed into the full orb of its influence upon her lover, and then waned and waned. His friendship for Annie, however, increased slowly—slowly, but most surely When he was whirled away for those four weeks by Marie M'Corcle, he told her all about it, and had, as usual, all her sympathy Then he was off for college, and corresponded with her regularly I was with him in college Many a time has he torn it my advice, the long letter he had written her, because it was only too warm, even though it was directed in the most fraternal manner possible to "My dear Sister Annie," and signed, "Your affectionate brother, Charles."

You can see immediately how it all ended. A friendship begun a mere indifference had ripened through six years into deep, genuine, affection He never dreamed that he loved Annie until he found that she was essential to his existence. For the first time he knew what true love was. He found that it was *not* the flush of passion, such as warmed him under the hot beauty of Dora—that it was *not* the fever of the imagination which diseased him under the moonlight of Marie. He found that love was not a passion, but a feeling, not a fit, but a condition, not a hot flush of blood, but the quick, even, everlasting flow of the heart's tide, giving health and life to the whole man.

I am writing nothing but actual fact, and so I cannot say how he told Annie his love, and how she accepted him He has talked to me I do believe, in all, it amounts to several hundred hours—about Dora and Marie He has quoted to me at least a dozen times every word that ever passed between him and them, but he never told me anything about his love conversation with Annie. They are married. They seem perfectly happy in the quiet possession of each other, and of the blue-eyed baby boy that laughs in their arms.

This was the making of Charles Bell. A remark of mine has led to the development of his noble form, and the establishment of that full health so essential to successful labour. His love for Dora has expanded his heart, and warmed and flushed him all through and through with an affection and persuasion and love that shows itself in his every tone and smile and clasp of the hand and word. His affair with Marie has cultivated his imagination, perhaps. His painful experience with Mr. Nelson has corrected all false ideas of men—has given him caution, self-possession, self-reliance, and energy. He has learned to meet things as they come; to do his utmost, and then not only not murmur at whatever happens, but actually to acquiesce, to rejoice in every event Annie is an infinite blessing to him. He is full of impulse, and she, by a silent, irresistible influence, controls and directs it. He is full of noble aspiration, but inclined to be fickle—she is ever pouring oil on the fire of his soul, as with an unseen angel hand—is silent and unconcerned when he wanders from his better self, and thus draws him quietly but irresistibly back.

Of course there were many circumstances in politics and situation which conspired to elevate him to his present position. I have only alluded to the quiet under-current of his private life. I have written what I have written only because I felt pleasure in doing so I do not think either he or Annie will be offended at my freedom should they read this, especially as I have not mentioned his real name, or that of the borough for which he has been returned. I am heartily sick of all romance and romantic ideas and description of men and women, but I do look upon the "Hon. Charles Bell and his amiable lady," as the papers will call them, as two of the finest persons in all my knowledge. Both are most sincere Christians, and, singular as it may seem to some, I regard their companionship and mutual influence as one which is to last not only through this poor world, but through all eternity.

GLIMPSES OF NEW BOOKS.

THE CHINESE AND THE LAST DAY OF THE YEAR.—The last days of the year are ordinarily with the Chinese days of anger and of mutual annoyance; for, having at this period made up their accounts, they are vehemently engaged in getting them in; and every Chinese being at once creditor and debtor, every Chinese is just now hunting down his debtors, and hunted by his creditors He who returns from his neighbour's house, which he has been throwing into utter confusion by his clamorous demands for what the neighbour owes him, finds his own house turned inside out by an uproarious creditor, and so the thing goes round. The whole town is a scene of vociferation, disputation, and fighting. On the last day of the year disorder attains its height, people rush in all directions with anything they can scratch together, to raise money upon at the broker's or pawnbroker's, the shops of which tradespeople are absolutely besieged throughout the day with proffers of clothes, bedding, furniture, cooking utensils, and moveables of every description. Those who have already cleared their houses in this way, and yet have not satisfied the demands upon them, post off to their relations and friends to borrow something or other, which they vow shall be returned immediately, but which immediately takes its way to the Tang-Pou, or pawnbroker's This species of anarchy continues till midnight; then calm resumes its sway No one, after the twelfth hour has struck, can claim a debt, or even make the slightest allusion to it. You now only hear the words of peace and good-will; everybody fraternises with everybody Those who were just before on the point of twisting their neighbour's neck now twine their friendly arms about it —*Hue's Christian Embassy, Tibet, and China*

THE CHARACTER AND GENIUS OF TALLEYRAND.—De Talleyrand has been calumniated by history on every side, by the men of the Restoration because he had deserted the aristocracy and the throne, by the men of the empire, because he had foreseen the fall, and repudiated the ruin of Napoleon, by all, because he had never thanked himself to any government as a slave to the palace, but had judged them while serving them, and quitted when, in serving them, these governments could no longer serve him. This judgment is correct It testifies in the character of M de Talleyrand, as a statesman, as much inferiority of devotion as superiority of mind We say as a statesman, for no one was more faithful or even more generous in his friendships His private and domestic intercourse was as much to be depended upon as his public intercourse was subject to inconstancy and the vicissitudes of power. But, through the oscillations of his public career, he had always two fixed points, round which his long life gravitated—the sentiment of his country to be saved, and the sentiment of the peace of the world to maintain, or to re-establish between the two which France and England, united by superior interests, have always jointly had the power to preserve. At the three great epochs of his life these fixed thoughts displayed themselves with great consistency in memorable transactions of his time In 1790, when he united with Mirabeau to transform the [illegible] and to level the church, without breaking with Great Britain, and without yielding the victory in the anarchical war with the Jacobins, at the congress of Vienna, when he alone restrained Europe from making France responsible for the defiance of Napoleon, and finally in 1830, when he negotiated at the conferences of London the compromise between Europe and France respecting Belgium, when he compelled, by his firmness and by his wisdom, the revolution to moderate itself, and Europe to resign itself to peace It may be asserted that, at the revolution of 1818, had he been alive at this still more extreme and convulsive crisis, M de Talleyrand would have evinced the same genius in avoiding war, sometimes glorious for France, but fatal to democracy The week which followed at Vienna the news of Bonaparte's invasion was made an age by him through his activity and its results Nature had not made an orator of Talleyrand, he had neither the fire of eloquence nor the powerful voice which propagate the statesman's opinions abroad, and which carry away, while they conquer, the the conviction and the passions, the reason and the minds of men persuaded or subdued by the force of language The power of his mind was in meditation, his influence in sagacity, and he gained the opinions of men, in conversation or in council, through their interest, and not through their enthusiasm A profound investigator and a skilful corrupter of the human heart, he won to his side the feelings or the selfishness of those who he did to convince His eloquence was not in his mouth, but in the souls of his auditors The secret instincts of each, well [illegible] turned and laid bare to his view, were the accomplices of his attack He did not persuade you to what you were not already convinced of, but his art was to display you to yourself, and to make you think that more was meant than met the ear. This was the reason that the slightest words, short reflections, and veiled reservations were sufficient for him; he took as under a corner of the curtain which concealed the depth of things, and directing the eyes of the people therein, he left them to reflect upon what they saw with apparent pleasure, silence and reflection did the rest in his favour. This description of eloquence, which supposes a precision of mind and a penetration of instinct almost equal to genius, was suited, above all, to an audience of kings and of ministers in a question wherein every ambition and every rivalship had an open ear and a wakeful pride. It was also suited to an assembly where all should be made to think, but where everything should not be spoken. The habit of associating with kings, with courts, and with aristocracies, in the midst of and on an equality with which M. de Talleyrand had passed his life, imparted to him at once the respect and the freedom which such high discussions imposed upon the negotiators of France. Occupied all the day in seeing separately the princes and ministers whose favourable opinion he wished to gain by considerations drawn from their peculiar interest, and present in the evening at their conferences, M. de Talleyrand made M de Besnadiere work all night at the notes, which he revised himself in the morning, and presented officially to the several cabinets As clever as Mirabeau in making others think for him while he was acting, and in grouping the powers of different minds, he imparted his ideas in a few words to his seconds, whom he required to carry them into effect. From these he received them elaborately, and stored them in his memory to make use of afterwards in the discussions. The persons before whom he spoke, M. de Metternich, Lord Castlereagh, Lord Wellington, M. de Nesselrode, Capo d'Istria, M de Hardenberg, the Emperor Alexander himself, were all equal to the appreciation of his vast intelligence All the consummate statesmen understood the language of affairs of state. The auditors were worthy of such questions, and they were further prepared by personal fascination to listen to the negociator M de Talleyrand knew how to please as well as to overawe, everything, even to his former life, was persuasive in him He had exhibited, it is true, great complusance, unpardonable in the eyes of some, towards the French revolution and the universal [illegible] of Napoleon, but was not so distinguished a deserter as most capable to enlighten the sovereigns and their courts on the dangers of the enemy's camp, of which nobody better knew the illusions, the power, and the weakness? And then was he not a revolutionist converted, and an accomplice thenceforth irreconcilable with Napoleon, betrayed or disavowed? Finally, was he not a member of the European aristocracy, bearing as a pledge of his sincerity the souvenirs and the pride of his name to that Areopagus of monarchies and aristocracies? His nature, his birth, his life, his manners—even his faults—but, above all, the superiority of [illegible], these, therefore, constituted M de Talleyrand the [illegible] in this supreme crisis of the [illegible] *the Monarchy in France.*—*By Alphonse de Lamartine*

LITERARY NOTICES.

THE EDUCATION OF FAMILIES.—No Publication has ever been welcomed with such tokens of approval from Heads of Families as the POPULAR EDUCATOR Every parent that sees it exclaims, "This is just the Work that has long been needed!" The education of the juvenile members of families will be facilitated, and adults who wish to revive what was acquired in youth, will find the pages of the POPULAR EDUCATOR deeply interesting and instructive. A circulation of nearly One Hundred Thousand has been attained. It has been found acceptable not only to the humbler classes, but to all ranks and conditions of persons who are desirous of attaining a sound education in French, Latin, German, Italian, Greek, and English Grammar, in Music, Mathematics in all its branches, Geography, Geology, Physiology, Botany, Chemistry, History, Ancient and Modern, Biography, Natural History, &c —To meet the urgent wishes of numerous Families and Individuals, it has been determined to publish an EXTRA EDITION upon superior Paper, at 1½d per Number, or in Monthly Parts, containing Four Numbers in a neat Wrapper, 7d., or when Five Numbers, 8½d This Extra Edition will be published without the weekly headings Persons wishing to have this Superior Paper Edition, must give their orders expressly for "*the Extra Edition of* THE POPULAR EDUCATOR," they will otherwise receive the common being published in Weekly Numbers, price One Penny each, or in Monthly Parts, price 5d, or when Five Numbers, 6d.

THE ILLUSTRATED EXHIBITOR AND MAGAZINE OF ART.—The First Volume of this splendidly embellished work, handsomely bound, price 6s 6d, will be ready July 1, and will contain upwards of Two Hundred Principal Engravings, and an equal number of Minor Engravings, Diagrams, &c The literary matter will be of the most varied and interesting description, and the volume, considering the enormous cost of its production, will certainly be one of the cheapest ever issued from the press

MISCELLANEA.

CONVICTIONS.—Deep in the foundations of his character, like the immovable blocks whereon great edifices repose, each man has to lay down for himself certain thoughts, sooner or later, of passing consequence, got out of secret and manifold communings regarding the vast mystery of here and hereafter: and on these thoughts again, and the more happily and grandly as these thoughts are strong, there will still base and pile themselves, in some loose order or other, conclusions, sentiments, and diverse predilections, extracted painfully or otherwise out of the experience that is gone through of life and its ways, and then employed back again in the scrutiny and contemplation of all that the world presents.

MORE TRUE THAN AGREEABLE.—"I have turned many a woman's head," boasted a young nobleman of France. "Yes," replied Talleyrand, "*away* from you."

POETRY RUN MAD, AND PARODY PARODIED.—He wore a dandy waistcoat the night when first we met, with a famous pair of whiskers and imperial of jet. His hair had all the haughtiness, his voice the manly tone, of a gentleman worth forty thousand dollars, all his own. I saw him but a moment, yet methinks I see him now with a very dandy waistcoat and a beaver on his brow. And once again I saw that brow—no beaver hat was there, but a shocking bad one wore he now, and matted was his hair. He wore a brick within his hat, the change was all complete, and he was flanked by constables, who marched him up the street. I saw him but a moment, yet methinks I see him now, charged by those worthy officers, with kicking up a row.

A MAXIM FOR ALL.—Be slow in choosing a friend, and slower to change him; courteous to all—intimate with few: slight no man for his meanness, nor esteem any for his wealth and greatness.

CALAMITIES OF THE IMAGINATION.—"As if the natural calamities of life," says Addison, "were not sufficient for it, we turn the most indifferent circumstances into misfortunes, and suffer as much from trifling accidents as from real evils. I have known the shooting of a star spoil a night's rest, and have seen a man in love grow pale, and lose his appetite, upon the plucking of a merry thought. A screech-owl at midnight has alarmed a family more than a band of robbers; nay, the voice of a cricket hath struck more terror than the roaring of a lion. There is nothing so inconsiderable which may not appear dreadful to an imagination that is filled with omens and prognostics. A rusty nail or a crooked pin shoots up into prodigies.

A YANKEE LAWYER CAUGHT TRIPPING.—"Pray may I ask," said an English bibliopole of distinction, at an agreeable party (in the United States), whether in America the law matrimonial entitles a man to marry the cousin of his widow?" "Oh, yes," answered a legal gentleman of eminence, "*that* is admissible, but there has been some doubt in our courts as to the propriety of a man's marrying the sister of his deceased *wife*." "Oh, ah," replied his querist, "in England it is somewhat different. *There* it has been, and is still held, that no man can marry the cousin of his widow, because, before he has a widow, he must die himself!" The "catch" was adroitly applied and, when exposed, created roars of [illegible]

GENIUS AND MEDIOCRITY.—Corneille did not speak correctly the language of which he was such a master. Descartes was silent in mixed society. Themistocles, when asked to play on a lute, said, "I cannot fiddle, but I can make a little village into a great city." Addison was unable to converse in company. Virgil was heavy colloquially. La Fontaine was coarse and stupid when surrounded by men. The Countess of Pembroke said of Chaucer that his silence was more agreeable to her than his conversation. Socrates, celebrated for his written orations, was so timid that he never ventured to speak in public. Dryden said that he was unfit for company. Hence it has been remarked, "Mediocrity can *talk*, it is for genius to *observe*."

THE SCHOOLMASTER CAUGHT.—A Schoolboy going into the village without leave, his master called after him—"Where are you going, sir?" "I am going to buy a ha'porth of nails." "What do you want a ha'porth of nails for?" "For a half-penny," replied the urchin.

DERIVATION OF HONEYMOON.—It was the custom of a higher order of Tuetones, a people who inhabited the northern part of Europe, to drink mead, or metheglin, a beverage made with honey, for thirty days after every wedding. From this custom comes the expression, "to spend the honeymoon."

PARENTAL DESIGNATION.—Somebody referring to the term "Father," being disused, and "Governor" substituted, recommends that the term "Governor" should also be discontinued, and "Relieving Officer" adopted, that being most descriptive of the duties of a male parent to a *hopeful* progeny

WHY FLIES CAN WALK ON THE CEILING.—"The phenomena," says Dr. Lardner, "which are vulgarly called suction, are merely the effects of atmospheric pressure. If a piece of moist leather be placed in close contact with a heavy body having a smooth surface, such as a stone or a piece of metal, it will adhere to it, and if a cord be attached to the leather, the stone or metal may be raised by it. This effect arises from the exclusion of the air between the leather and the stone. The weight of the atmosphere presses their surfaces together with a force amounting to 15 lbs. on a square inch of the surface of contact. The power of flies, and other insects, to walk on ceilings, smooth pieces of wood, and other similar surfaces, in doing which the gravity of their bodies appears to have no effect, is explained upon the same principle. Their feet are provided with an apparatus similar exactly to a leather sucker applied to a stone."

WAR

Man's evil nature, that apology
Which kings who rule, and cowards who crouch, set up
For their unnumbered crimes, sheds not the blood
Which desolates the discord—wasted land.
From kings, and priests, and statesmen, war arose,
Whose safety is man's deep unbettered woe,
Whose grandeur is debasement. Let the axe
Strike at the root, the poison-tree will fall;
And where its venomed exaltations spread
Ruin, and death, and woe, where millions lay
Quenching the serpent's famine, and their bones
Bleaching unburied in the putrid blast,
A garden shall arise, in loveliness
Surpassing fabled Eden. SHELLEY

ANSWERS TO CORRESPONDENTS

J. PARKER.—We cannot "explain the [illegible] through which the tobacco-plant has to [illegible] fore it is fit for use." If report speak truly, some of those "proc[illegible] ably delicate! In answer to your other query, "Are tobacco smoking and chewing, and snuff-taking, *very injurious to health*!" we answer, on the authority of scores of eminent medical practitioners, VERY!

A STUDENT.—The word "concrete" is taken from a Latin compound, which, translated literally, means "grown together." There are natural and factitious concretes. Antimony is a *natural* concrete, formed in the bowels of the earth; soap is a *factitious* concrete, prepared by art. In *chemistry*, concretion means the consolidation of any fluid substance into a [illegible] *ory* it means the growing toget[illegible] ought to be separate; in *mechanic*, [illegible] ions are substances formed in the animal body either by the condensation of substances into a harder state than is natural, or by the growing together of different substances into one body.

EXPERIMENTER.—We confess that we were deceived as to the character of the "Receipt-book" mentioned in page 64. Upon closer [illegible] nation, we find that many of the receipts are reprints and forms of preparations now obsolete. That for engraving on glass is especially defective, and could not be followed without danger.

BETTY.—The "pest" of which you complain, namely, "*blackheadles*"—we presume you mean blackbeetles or cockro[illegible] nated by sprinkling un[illegible] places they frequent, or by placing a dish or pa[illegible] near those places with a little treacle or syrup, as a bait, with a few pieces of flat stick or lath leaning against its sides, so as to form a sort of gangway for the beetles to climb up by, they will be sure to visit the pan, and will be unable to

The "beetle-wafers," sold at the shop[illegible] le of equal quantities of flour, sugar, and red-lead. A little of this paste placed near their haunts every night, will very [illegible] numbers. The paste should be renewed in th[illegible] ning.

EIGHTEEN.—You wish to [illegible] w how you may become "a good penman [illegible] by the best specimens you can get, and copy them again and again, till you acquire correctness of form and freedom in handling your pen. At the same time allow us to urge the importance of improving your spelling—"*owbridge*" and "*persue*" would spoil the best penmanship in the world.

E. M.—You had better address your inquiries to M. Julien himself; we do not see how [illegible] can give you correct [illegible]

. K.—You cannot [illegible] surely be serious in asking "how to bring a gooseberry-bush *to life* that has been *killed* with lightning!"

A. R. W.—You wish us to suggest to you "some way of employing your leisure which may be profitable to your purse." How can we possibly do this in total ignorance, as we are, of your turn of mind, your qualifications, &c. &c.? We might suggest "a thousand and one plans," none of which might be suited to your talents or opportunities.

"HAPPY JACK."—We must decline publishing the memoir of which you speak, especially as you state that "the subject has been exhausted by far more able hands," and that your article contains "many badly-written passages." We do not think, with you, that a paper bearing that character would be "good enough to appear in the Working Man's Friend;" nor that we should publish it merely for the sake of "exposing demerits."

AN ARTIST.—The marble statue of Sir Isaac Newton, to which you refer, is, we presume, that by Roubiliac, in the chapel of Trinity College, Cambridge. It is a beautiful specimen of the master's sculpture, and is greatly admired by [illegible] view it. There is no at the [illegible] of New[illegible] you suppose, under the dome of St. Paul's cathedral, the four colossal statues placed there are Dr. Samuel Johnson, Sir William Jones, Howard the philanthropist, and Sir Joshua Reynolds.

WORKING MAN'S FRIEND

AND FAMILY INSTRUCTOR.

NEW SERIES.—VOL. II., No. 31] SATURDAY, MAY 22, 1852. [PRICE ONE PENNY.

THE HOLY LAND.

"THE Holy City" is, in many respects, unlike every other in the world, there is no period of its history which is not full of interest; there is not a locality in it, or about it, which has not some connexion with events of moment, with its glory and renown in other days, or the sad story of its degradation and ruin.

The houses in Jerusalem are usually built of stone and th outer walls are laid with care, and, in some cases, with muc attention to architectural beauty and design. The window which look out upon the streets, are mostly plain, not large and almost exclusively confined to the upper stories; onl in few instances is the lattice-work seen, which adds so muc

ornament to the windows and houses in Cairo, and which is, as certainly necessary to the strict seclusion of the Turkish harim. The first floor, or story, as is almost universal in the East, is occupied for various purposes, but more as a receptacle of mud various articles than as a place of abode. The family of the occupants always seek the upper floors, which, except in the hottest part of the season, are more pleasant, and furnished with everything which can minister to the enjoyment of an oriental's life. It is a safe rule, too, not to judge of what a house is, or what it contains, by the appearance of the first or ground floor. The entrance is through a large, sometimes rather small door, of strong material, and kept carefully closed, in Jerusalem, every door appears to have an iron ring on it, which serves the purpose of a knocker. One peculiarity in the rooms is well worth recording: there appears not to be a house in the city but which has several of its upper apartments with dome-shaped ceilings, which are ornamented oftentimes with tasteful mouldings and other pretty devices, to set them off to advantage. These project above, generally in the midst of the flat roof or terrace, and form one of the very singular and really picturesque features about the Holy City. The terrace is, of course, open to the sky, and at certain seasons of the day, particularly in the cool of the twilight and evening, or in the morning hours, before the sun has arisen in his strength, it is not only the pleasantest spot in the whole house, but is resorted to by all ages and classes. The houses are in general better built, and the streets cleaner than those of Alexandria, Smyrna, or even Constantinople.

The Holy City is inhabited by a mixed population, consisting of Christians, Jews and Mohammedans. Of their numbers it is by no means easy to obtain any accurate estimate. Many speculations have been indulged on the subject, but the truth is, no one knows much about the matter, and at best, we can only approximate to the actual result. The streets are never thronged, except during the season when the pilgrims visit Jerusalem, and not even then does the city become very much crowded, the bazaars have something of a bustling air, but in them also we do not find the crowds of people which make it so difficult to thread the way in a city like Cairo, and it is undoubtedly and strikingly true, that, in general, the streets of the Holy City are solitary, and that a visitor may often walk a long distance without meeting or seeing a single individual. Hence, the probability is, that the population of Jerusalem cannot be, by any means, as large as the city is capable of containing, and, perhaps, we shall not be far out of the way in supposing that there are five thousand Christians, four thousand Jews, and seven thousand Mohammedans, [illegible] fifteen thousand. Dr. [illegible] from a calculation made from the taxable males of the city, gives the population as follows: Mohammedans, four thousand five hundred, Jews, three thousand, Christians, three thousand five hundred, that is, allowing for possible omissions, inmates of the convents, &c., a total of not more than eleven thousand five hundred. In a matter of this kind, where so much is mere conjecture, it becomes no one to be very positive, but, with deference, the learned Doctor appears to have given a number as much too low as others have in an opposite direction.

The character and condition of the people depend considerably upon the fact whether they are Jews, Mohammedans, or Christians. The Jews occupy the vicinity of Mount Zion, or the southern part of the city, and are, to a very great extent, a degraded race, depending on charity for support, despised and hated by both Mohammedans and Christians. They live in the very narrowest lanes, and most filthy and disagreeable quarter of the Holy City, and they endure scorn and contempt with a hardihood which no other nation or people ever manifested. Most of them are very poor, and nearly all are supported by contributions from abroad, a fact which has an important bearing upon the question of their becoming Christians, for the mission to the Jews has not only got to convince them of their guilt and perversity in rejecting the Messiah, but, on their professing Christianity, is obliged to undertake their temporal support also, as a necessary consequence. Few persons ever do more than walk or ride through the Jews' quarter, both because it is [illegible] through narrow and dirty streets, and because it rarely is possible to penetrate the cold reserve [illegible] Jews, only, will be observed to familiarize discourse as a friend or a Christian to appreciate a Jew, or a Jew really to understand a Christian. In general, he has an instinctive dislike to a believer in Christ Jesus, and, to our shame, be it confessed, the dislike and hatred are but too often mutual. In the Jews' quarter, however, the visitor is now accosted by some aged, hoary mendicant, asking alms of one whom, in his soul, he scorns and hates; now urged to buy some trinkets of gold or silver, now meeting a Jewish maiden or two, who casting a glance of mingled dislike and contempt upon the stranger, turn and hasten away, now surveying with astonishment the wretched exteriors of their dwellings, the many offensive things which have been placed in the midst to annoy and insult them, as the shambles and the mosque in the very heart of their quarter, and the profound indolence, misery, degradation, and destitution all around, and now, I am, wondering at the sturdy demeanour, the unconquerable powers of endurance of the Jew, and his steady adherence to those dogmas which he has inherited from his fathers, and which he is ready to die to maintain.

The Jews' place of wailing is not the least interesting spot in Jerusalem, and, to a Christian traveller, is very suggestive of lessons of warning and instruction. It is a place comprising about a hundred feet of the west wall of the Haram, not far from its southern boundary, and one which, considered in great measure from observation, is a part of the deep valley between Mount Zion and Mount Moriah, much very touching to the feelings of the despised and downtrodden covenant of Israel who here weekly assemble to wail and mourn over the desolation and downfall of Judah. The massive stones of the remains of the wall point back to a period of great antiquity, and, unless we refer the erection of so grand a work to the time of Solomon, it is difficult to tell when or by whom it could have been accomplished, for there has never been since his days, an era of wealth and prosperity sufficient to enable the Jews to devote time and labour to such undertakings as these. "The few Israelites," says a traveller, "whom I chanced to see here on this occasion did not appear to be much affected with grief or depression, they were quite willing to act as guides, and always ready to beg, even though they knew that I was a Christian. After measuring some of the stones, and satisfying myself of the very great size of many of them, I went a short distance further, and at the south west angle of the temple area beheld the evident remains of an ancient arch, forming part of a huge bridge. Dr. Robinson identifies this with the bridge mentioned incidentally by Josephus, as leading from this part of the temple across the valley of the Tyropoeon to the Xystus on Mount Zion, and, in his opinion, 'it proves incontestably the antiquity of that portion of the wall from which it springs.' Though century after century has rolled away since this massive masonry was here erected by that great monarch, who built the glorious and splendid temple of Jehovah, and though ruin and desolation have visited the Holy City, and laid it low in the dust, its temple destroyed, and its people scattered over the face of the wide world, yet these foundations still endure, and are immovable as at the beginning. Nor is there aught in the present physical condition of these remains to prevent the from continuing as long as the world shall last. It was the temple of the living God, and, like the everlasting hills on which it stood, its foundations were laid 'for all time.'"

Leaving this interesting locality, passing up the easterly part of Zion, through a number of crooked lanes, and proceeding for some distance in a south-westerly direction, the traveller comes to a manufactory of pottery-ware, made from clay found in the adjacent valley of Hinnom. It is but a little way from the Zion gate. Just south of the pottery, and hard by the city-gate, are the Lepers' Huts, a set of miserable low clay hovels, the habitations of those unfortunate [illegible] are now found only at Jerusalem and Nablous. Dr. Schultz had them, and ascertained their numbers to be twenty-seven, men, women, and children—Mohammedan. They are allowed to intermarry, and thus propagate this loathsome malady, which is hereditary. They receive a miserable pittance for their maintenance from the government, which they are fain to eke out by begging. And a most pitiable and disgusting sight it is to see the poor wretches laid at the entrance of the gates of the city, asking alms of the passengers

with their dotched hands or stamps, in various stages of decay, under the influence of this devouring disease.

The Turkish or Mohammedan population of Jerusalem occupy the north-eastern portion of the city, which is, on the whole, the most airy and pleasant. By their position as rulers, and many endowments, as well as by natural temperament, they are harshly insolent, and tyrannical. The higher officers vary their life of indolence by listening to the wretched bickerings and complaints of one Christian sect or community against another, by receiving bribes from both sides, to favour their respective projects, and by treating with scorn and contempt the quarrels of one, jealous, and vindictive Greek and Latin, whose mutual hatred knows no bounds. The underlings pursue the same course on a more limited scale; the soldiery do not trouble themselves in the discharge of their duties as guards, as to how the dreadful scenes enacted in the church of the Holy Sepulchre, of which they are spectators, they are not likely to derive much edification, or even reason for abandoning Mohammedism, and adopting this caricature of Christianity, and as for the Turk, in general, and others of that race, who believe in the Arabian prophet, they do not scruple to cry in their heads before their sandboys, as in the Holy City they bestow "mercy" on, or to use their blows, and call Christians and Jewish dogs when they dare, and to feel for them the most supreme contempt for all but their creed, and they would, had they the power, not hesitate to crush them underfoot. Probably they are the more bitter and unlike from the conviction, which is well-nigh universal in the East, that the power of Mohammedanism is failing, and that its downfall is not far distant.

The sad condition of the so-called Christians in Jerusalem is on the whole, calculated to excite commiseration. The principal occupation is the making of crosses, beads, crucifixes, and similar articles, which they find a ready sale at the annual influx of pilgrims, but, in general, the majority of them are very poor, ignorant, and superstitious. The Holy City has no trade or commerce, and nothing to excite the emulation of its people to improve their temporal positions, and for the most part they appear listless, indolent, and thoughtless, living on from year to year in discontented poverty. There are, however, exceptions to this remark for there is considerable wealth hoarded up in Jerusalem, and in private, and, unseen by the jealous Turks, some revel in the enjoyment of comforts and even luxuries far beyond what they might be supposed to possess, judging of them from their personal appearance, or the exterior of their habitations.

"Imagine yourself," says a recent traveller, "on a bright sunny spring morning, to be with me ready for a walk about Zion, and a visit to some of its touching localities. We are not far from the Damascus Gate, but we will not pass through it at this time. Let us rather proceed by the narrow street or lane leading towards the Jaffa Gate. In a few minutes we come to the *Via Dolorosa*, and turning off towards the East, we traverse this steep and rugged way, filled with thoughts of Him whose sufferings and death were for our sins, and who, for our sakes, endured the cross, despising the shame. We soon reach, after a turning or two, the gate in the Eastern wall, commonly, but I believe wrongly, called 'St Stephen's Gate,' passing first under an archway where, according to tradition, Pontius Pilate showed to the people our Saviour wearing the crown of thorns and the purple robe, and exclaimed, 'Behold the man!' Hence the name, the 'Arch of Ecce Homo.' This gate, called by the natives, both Christian and Mohammedan, *Bab Sitty Maryam*, or 'St Mary's Gate,' is ornamented by four lions, sculptured in relief, over the gateway, probably the work of the Christians. As you will observe, decoration of this kind is peculiar in an oriental city, and hardly accords with the character and appearance of the Turkish guards who are lounging about, and who look at us with no friendly eyes.

"Let us pause for a moment and look around, for here we are gazing upon holy ground. Directly before us is the steep and stony descent into the valley of Jehoshaphat, a little way further, the brook Kedron, then Gethsemane, and then the sides and steeps of the Mount of Olives, crowned by the ruined Church of the Ascension. Towards the north and east, the valley bears [illegible] the hill-sides, very [illegible] people of the [illegible] and at some distance [illegible] Jehoshaphat. Above [illegible] upon the mind of [illegible] does he feel to talk [illegible] out but one name!

"Let us go on, [illegible] many places [illegible] and there [illegible] brook, and to the [illegible] to [illegible] ground, for here, within a few [illegible] garden of Gethsemane! On the [illegible] word excite more [illegible] hallowed [illegible] disciples" tread [illegible] gave to the [illegible] varied and [illegible] olive-trees [illegible] selves, the [illegible] and with emotion [illegible] of the Gospels, and [illegible] evangelists read [illegible] pain and [illegible] bowed head, and [illegible] agony of whom we [illegible] call to mind, with [illegible] and acquainted with grief,' of him who so pathetically uttered the fearful words, 'My soul is [illegible] even unto death.'

> 'Dear, sacred haunts of glory and of woe,
> Hollow'd, on hours, to that Heart's anguish holy!
> One heart-sad thought breathes through the air and flow
> Th' unearthly thoughtless hour of earth's dark law
> And fast at evening moan from the [illegible]
> Thy foot-tops moss'd o'er graves [illegible]
> Were blest to me as soul-sound [illegible]
> Is every scene of hers for [illegible]
>
> There is a spot within these [illegible]
> That for The Sacrificed [illegible]
> One angel knows! O might prayer
> To win that knowledge! sure each [illegible]
> Less quickly from the [illegible]
> Other'd where Christ in agony was laid.'

"Let us continue our walk by the side of the Mount of Olives, the ascent is not steep, except here and there, as we go on you will see how many [illegible] which Jerusalem, even now, is [illegible] and sublimity. The number of trees is not large, much less so, doubtless, than in early days, when this lofty hill received its name from the abundance of olive-trees which flourished on its steeps and slopes. Here and there, in some retired spot or enclosure, a little way from the path, are parties of women and children, who have come out of the dust, hot city, to rest under the trees and on the greensward and to enjoy the delight of chatting one with another in unrestrained freedom. But see! there is a little girl who is throwing stones at us, and why, do you suppose? let us ask the reason, it seems there be, 'What do you mean by throwing stones at us?' the answer comes quickly but pertly, 'What do you want to be looking at us as you do?—and if you don't go away and don't look where we are, we will throw more stones at you, ye Christian dogs!' Such is the spirit breathed into the young by their [illegible] trained Mohammedans. Terms of execration [illegible] and returns their abuse in kind and no small amount, but we can well afford to pass by the [illegible] our upward walk. We meet but very few persons, and were we to judge by these evidences of life and gaiety round about the Holy City, we should see and feel, most deeply, how true it is, that she is trodden down and desolate. Instead of the busy hundreds and thousands moving to and

A SYNAGOGUE AT JERUSALEM.

fro, engaged in their daily occupations, we see only single individuals, or occasional small parties, instead of the distant hum and noise of a populous city, not a sound is heard and stillness like that of the grave broods over everything,—

'No martial myriads muster in thy gate
No supplant nation ... thy temple wait
No prophet bards, thy glittering courts among,
Wake the full lyre, and swell the tide of song,
But lawless force, and meagre want are there,
And the quick darting eye of restless fear,
While cold oblivion 'mid the ruins laid,
Folds his dank wing beneath the ivy shade.'

And when we stand still for a few moments, and look around us, how dreary seems the scene, and how true and exact the words of prophetic denunciations against the wickedness and rebellion of the people!"

MARTIN F. TUPPER.

THE name of Martin Farquhar Tupper has become popularly known not only in this country, but in America and on the continent, as that of an author of great original genius, of highly cultivated intellect, extensive scholarship, and very superior poetic powers. He is the eldest son of a late eminent surgeon, Martin Tupper, Esq., F.R.S., who, after a prosperous and successful practice of five-and-thirty years, died suddenly in his sleep, of *angina pectoris*, on the 8th of December, 1844, at Southhill-park, the residence of the Earl of Limerick, only a few hours after that nobleman had himself expired in his arms. The subject of the present sketch was born in London in 1810. The family from which he is descended, an ancient and honourable one, came originally from Germany. In consequence of the persecution of the protestants by Charles V., they left Hesse Cassel in 1551, and settled in Guernsey. They have always held the rank of gentlemen, and the circumstances of the author of "Proverbial Philosophy" are affluent. With him literature is not a profession, but a recreation, and he has done high honour to it, and, when we consider the popular tendencies of his poems, we may congratulate both him and ourselves on his choice.

He received the first part of his education at the Charterhouse, and afterwards went to Christ Church, Oxford, where he took the degrees of B.A. and M.A. He subsequently entered at Lincoln's Inn, and in due time was called to the bar, but never practised as a barrister. At the age of twenty-six, he married, and has a fine young family of sons and daughters.

Mr. Tupper's first publication was a little work issued in 1832, entitled "Sacra Poesis." The first series of "Proverbial Philosophy: a Book of Thoughts and Argument Originally treated," was published in December, 1837, and the second series in 1842. This work at once excited attention, and called forth the most opposite criticisms. It was hailed as the production of one inspired like a true sage, wrote and

[illegible] true poet. The pages of "Proverbial Philosophy" breathe throughout the finest spirit of genuine poetry. In a review which appeared about that time, the volume was described as "a work abounding in rich thoughts and delicate fancies—in social philosophy and high moral resolutions, and which may be read over and over again by the young philosopher, or poetical dreamer, with equal profit and delight. And as if writing prophetically of the proud and enviable position to which Mr. Tupper was yet to attain in literature, the reviewer triumphantly asked, "Have we now not done enough to show that a poet of power and promise, a poet and philosopher both, is amongst us to delight and instruct, to elevate and guide. Do we err in saying that a fresh leaf is added to the laurel crown of poetry?" The praises of the other reviewers were no less enthusiastic, and no less just. "There is more novelty in the sentiments," said another critic, "a greater sweep of subjects, and a finer sense of moral beauty displayed by Mr. Tupper, than we remember to have seen in any work of its class, excepting, of course, the divine Proverbs of Solomon. We also discover in his 'Philosophy' the stores of extensive reading, and the undisputable proofs of habitual and devout reflection, as well as the workings of an elegant mind." The work met with unprecedented success, and six large editions of it have been sold. The author was elected a Fellow of the Royal Society soon after the appearance of his great work. He had already shown himself to be, in Shakspeare's phrase, "a fellow of infinite wit," and, we may add, of wisdom too. The king of Prussia, in token of his majesty's high approbation of "Proverbial Philosophy," sent him the gold medal for science and literature, and the work became very popular in the United States. In New York alone ten thousand copies were sold in a single year, and the work is known to be published in several other American cities. Its reputation is also great in the British colonies.

Mr. Tupper's next work was "Geraldine, a Sequel to Coleridge's 'Christabel,' with other Poems," published in 1838. The ideal plan of the "Christabel" has been well brought out by Mr. Tupper in his sequel, and it is no small praise to him to say that the wild and original spirit that pervades it is every way akin to the sublime and beautiful inspiration of the great but unfinished poem of Coleridge itself. The minor poems contained in the volume are singularly pleasing and graceful, and abound in touches of real beauty and personal feeling. Besides "Ellen Grey," the pieces entitled "The Spinning Life," "Children," "A Cabinet of Fossils," "The African Desert," and some of the sonnets, are about all are good.

In 1839 he published "A Modern Pentateuch, to Commemorate Septuagint of Worthies," designed to furnish illustrations and descriptions of characters of seventy of the most remarkable personages of sacred and profane history, ancient and modern. Among them are some of the patriarchs, some of the ancient sages of the east, some of the most noted men of Greece and Rome, chiefly philosophers and authors, some of the apostles, and some of the most remarkable personages of the middle ages and downwards, in the stream of time, to the present century. From the nature of the work, and its limits not admitting of more than seventy names, there are, of course, many omissions, but each of "the Worthies" introduced is the subject of a sonnet, and brief biographical sketch. The work exhibits all the peculiar qualities of Mr. Tupper's genius and style, high poetic feeling, fine taste, great fertility of imagination, and boldness of opinion, and speculation, with profound practical thought, extensive and varied learning, a general knowledge of mankind and history, and great command of language.

In 1840 Mr. Tupper produced a pleasant volume of odds and ends called "An Author's Mind." Among the contents are pieces entitled, "The Author's Mind: a Ramble," "Nero: a Tragedy," "Opium: a History," "Psychotherion: an Argument," "Heathenism: an Apology," "Woman: a Subject," "Tolomastrix: a Title," "Appendix: an After-thought," "Home: an Epic," &c. Some poems of remarkable beauty are also introduced, with great effect, among the other pieces which compose this agreeable collection of "gaieties and gravities."

Mr. Tupper's next work, a rural novel, entitled "The Crock of Gold," designed to illustrate the commandment, "Thou shalt not kill," as well as to show the cruel and maddening effect of avarice, was published in 1844. It is a simple tale, very beautifully told, and full of an extraordinary

[illegible] books, indeed which by its wit and pathos, its deep insight into human passions, and its powerful delineations of virtue and crime, enchain the attention of the reader till he has finished its perusal, and leave behind a strong but salutary impression on the mind. The plot purports to be the history of a poor labourer and his family, who, from a life of peaceful and unpretending drudgery, became discontented and repining, and were gradually involved in sore trials and serious troubles. The principal characters of the story are honest Roger Acton, the luckless maker of "the crock of gold," his pure and simple-hearted daughter, Grace, her lover, Jonathan, Simon Jennings, the murderer, his aunt, Bridget Quarles, and Ben Burke, the poacher. The murder of Bridget by Jennings is very powerfully [illegible] and the chapter headed "Next Morning," is perhaps [illegible] the most successful one of the finest pieces of writing we have ever read.

The same year (1844) Mr. Tupper published two works of fiction, in one volume each; namely, "Heart: a Social Novel," and "The Twins: a Domestic Novel." The main design of these works appears to have been upon something better than a mere sketchy foundation in each, to introduce some exciting scenes, and some episodal bursts of hearty religious writing; and they move more or less illustrate the seventh and tenth commandments. The twofold object of the author in the two stories—that is, the depicturing of virtue and vice in their appropriate colours, and that as strongly as possible, and the pointing the moral, of each obtaining in due course its appropriate reward—is powerfully worked out in both, and, as one of the most discriminating and competent critics said, "in every page there is something which a reader would wish to bear in his memory for ever." For power of animated description, for eloquent reflection upon the events of everyday life, and for soft, touching, pathetic appeals to the best feelings of the heart, the volumes are worthy a place on every [illegible] table in the kingdom." The same [illegible] says, very justly, of Mr. Tupper's style: "There is a genuine beauty, straightforward downrightness about him that brings him right on the mark at once. He [illegible] but they are animated by [illegible], that impresses their meaning on the mind and memory. He forms, as it were, a sort of halfway-style between Dickens and Carlyle. Without the regularly successful power of Boz, he has much of his pathos and *picturesqueness* in description; and,

without his eccentricity, he possesses no slight portion of the full-toned energy and characteristic raciness of the author of 'Sartor Resartus.'" Of such works as these three novels of Mr Tupper, we hope yet to see many more specimens from his graphic pen

His next work, published in 1845, is entitled "A Thousand Lines," a little tract of but sixty pages, containing poems on various subjects, written in his most captivating manner. Thought vigorous and fruitful, imagery vivid and beautiful, feeling warm and unaffected, clothed in language strong, hearty, and emphatic, or soft, pathetic, and musical as the theme or the rhythm required, with an originality that cannot fail to be acknowledged in them all, are the characteristics of the verses of this little book. A new version of "Rule Britannia," a stirring song for patriots of the present day, has in it a genuine Advent English spirit and tone, that make the very heart bound when pe[illegible] Ship" is, indeed, an exquisite little lyric, full of delicate pathos, and instinct with good music; and a sound manly spirit of philosophy breathes in the lines and closes of "Never Give Up!"

In appearance, Mr. Tupper is, we believe about the middle-age, young looking and well-favoured, with black hair, cheerful aspect, and cordial manner Both in his deportment and in his writings, he has all the elements of popularity Of the former, however, the writer of this sketch cannot speak from personal knowledge, as he is altogether unacquainted with him With the latter he is quite familiar Mr Tupper's usual residence is at Albury, Surrey

THE SICK CHILD.

"I wish I could play, too," said my poor sick boy, in a plaintive tone, as he sat on my knee, having intently for space of nearly half an hour watched from the window of our inn a group of healthful children indulging in boisterous play. It was at a watering-place, and near the close of an early day in the month of April. We had come to the spot in hope of the possible recovery of a child of six years of age, who had been pining away all the winter. With the first gleam of spring sunshine the idea of a visit hither was indulged, and though the fear of the chilling north-east winds, which never fail in the parts where we dwell to precede the warm showers of late April or early May, strongly dissuaded any change of locality, yet a mother's love and anxiety, combined with the necessity which was felt of attempting something for the child's restoration, prevailed over other considerations, and led us to try the effect of a mild sea-air. It is true that the same expedients had been fruitless in the case of two brothers born immediately in succession before the present invalid. But then Theophilus had reached a greater age than they, and might find that benefical which had proved of no service to them. And so the trial was made.

Three children, one after the other, wasting away, is a bitter passage in one's domestic history If nothing on earth is so delightful to look on as a healthful, happy child, full of life and glee, equally dark, and, to the parents' heart, afflicting, is the sight of one whose days and nights are divided between suffering and unnatural slumber, whose cheeks daily lose their hue, whose eye contracts a glassy lustre, and whose whole form becomes emaciated, till weeks and months of pain and decay at length bring dissolution. Such with these boys in succession was our sad experience. The description is given in general terms, but they contain a volume of minute particulars, the details of which would be harrowing to every feeling bosom The history of one day in one week would suffice to show that there are experiences and sufferings in domestic life of a far intenser kind than most which pass on the public stage and are recorded in the pages of history, and which imply and require the exercise of some of the loftiest virtues Did the sanctity of home and of the sick chamber permit the revelation, it would be easy to exemplify, by actual instances, the depth and power of endurance, the patience, and fruitfulness in expedients, which characterise and ennoble a mother's love while waiting and serving near the couch of a sick child. Indeed, to all who own and feel the relationship of consanguinity with the little sufferer, many bitter pains make themselves felt What is so distressingly thrilling as the cry, the wail, and the moan of a child in agony? Unable to give articulate expression to his grief impotent to form the slightest conjecture of its cause untrained to behold the hand of mercy in the pressure of his sorrows, rendered imdocile and irritable by lengthened pain and by the same perverse monitor taught to regard the fondest cares and most judicious attentions as unnecessary if not unkind interferences with his will and his comforts, the child suffers almost without mitigation all the sad ills which darken and trouble the way by which mortal man goes to his last resting-place.

In the midst of these ills was my poor boy when he uttered the words with which I commenced these remarks. All the previous winter had he been more or less under restriction He could not, as others of his age, take an airing on a fine day The nursery and the bedroom were for the most part the only [illegible]ces he could be permitted to visit. Or, if he descended to join the rest of the family at the dinner-table, or around the piano, some privation was sure to fall to his lot. The simple luxuries which his brothers and sisters enjoyed were necessarily denied to him. In their sports he could hardly even join, and when he was so favoured, it was but a painful and limited enjoyment; nor seldom would even this little be attended by penalties which brought days of indisposition for an hour's hilarity.

As a natural consequence of his sufferings and privations his face lost its ease and playfulness, and contracted instead a constrained and very painful expression. Even the smile which rarely played over his features had something forced and unnatural in it, child though he was, and the not unfrequent knitting of the brows when under a paroxysm, smote the beholder's heart with grief. As is not unusual in the case of young sufferers, his intellect gave intimations of premature strength; all its faculties seemed sharpened, his observation was keen and ceaseless, nothing escaped his eye, his inferences were extraordinarily acute and correct, and even his judgment was in general sound. If we may venture to pronounce an opinion on such a point, we should feel justified in affirming that the education of a whole life was in his case compressed within a very few years.

And this remark may serve to assign some cause why the young are thus permitted to suffer, and why they are removed from this state so long before the purposes have been attained for which life was given. In fact, the discipline they pass through in their pains, often produces a development of mind superior to that which others reach in a long course of years, so that, though they are taken away early, yet is it not prematurely, for in some sense the fruit is ripe, and they are not unprepared for that higher and holier education to which eternity will introduce them. Nor is it merely the intellect that is expanded and strengthened. The moral feelings, also, are disciplined called forth, and refined It is true that, when under the immediate infliction of pain, my Theophilus was liable to be impatient and perverse, but in the general tenour of his feelings there was a more than ordinary self-command Privations he could and did impose on himself without repining Uncomplainingly would he sit for hours together and watch the children play. Nay, much of his pleasure seemed to consist in calmly contemplating their rude mirth. And then with what gratitude did he commonly receive the marks of affection, the little presents—the toy, or a few flowers, which his brothers and sisters were wont to offer for his acceptance!

His sister Jane heard those words, "I wish I could play too!" The moment they were uttered, she was at his side Giving him a kiss, she hurried away, and in a very short space was back again, bringing with her sea-shells of various sizes and shapes, the colours and forms of which she had brought out by friction, and which presented many elegant hues and delicate hues. The beautiful is soothing. Theophilus took up and carefully surveyed every shell, and he and Jane talked over their qualities with taste and discrimination. Suddenly he fell back on his couch wearied with the exertion. Jane hastened to the table and procured a beverage, of which she gave him to drink. "Lie still," she said, 'I will tell you the sad wreck which took place last night. You know how strong the wind blew; I was afraid that there would be a loss of life. Well, Mr. Green and his son William went out shrimping before the storm came on. This morning their boat has been cast ashore empty, and they are both drowned

"Then," answered Theophilus, "what will little Annie do? Poor child! she has now no father, and her brother too is gone. Oh, how happily they used to play together! Jane, take that half crown which uncle Robert gave me, and carry it to Annie; it will help her to buy mourning. But, oh dear, your story has made me feel very ill. Call mamma."

Mrs. Williams came; she found her child in a state of great agitation.

What should I do," exclaimed he, "if I were to lose papa?" Then he burst into tears, and mourned almost as bitterly as if the imaginary loss was real.

My wife did, as usual, all she could to sooth him, but Jane's indiscretion in reporting Mr Green's death, produced in him an irritability which lasted for several days. Jane, deeply distressed at this result, doubled her exertions to compose his feelings and promote his bodily comfort. Gratifying was it to witness the self-denial of that little girl. Who, seeing it, could doubt that the shafts of domestic sorrow come winged with blessings? All day long would she sit by her brother's side, now humming a tune, now singing a childish song; now showing him pictures, now reading a tale; now spinning a humming-top, now cutting out for the figures; now building castles in the air with wooden bricks. But almost endless would be the enumeration were I to attempt to tell of all the kind and considerate ways in which she tried to amuse her brother. Yet every now and then a dull moan was extorted from the little sufferer. The moan was forthwith answered by sounds of inarticulate sympathy murmured out by my darling Jane. "A mother's love" could scarcely surpass that child's tenderness and care. No sooner was she awake in the morning, than she hurried to her mother's chamber, where her brother lay: yes, lay, rather than slept. Her last thought at night was her poor suffering brother. Had she been permitted, she would have made his bed hers, and with difficulty was she ever detached from his side. In him she seemed to have forgotten herself. Her deep, calm, sisterly love, enabled her to "bear all things" that came from him or could minister to his repose. His fractiousness she never regarded. If he complained, she gave no reply. Truly was she a ministering angel to her sick brother.

In a few weeks after our arrival at S——, the weather became fine and genial. Procuring a hand-carriage for Theophilus, we wandered up and down the country. Going or returning we found ourselves on the beach. The boy had a peculiar pleasure in watching the ocean. "Smooth and beautiful!" he would sometimes murmur out. At other times the words were, "It lives." "To and fro, those waters ever go; they must live." "The spirit of God moves them thus." Then, after looking intently on the sea for half an hour or more, he would sink back exhausted in his carriage, close his eyes, and remain motionless, as if in deep meditation. Careful was I that he might not then be disturbed. I fancied that then the Divine Spirit was communing with his spirit. I looked on those moments of rest with reverence. It was a solemn joy for me to think that my boy was in mind with God. On one of these occasions he opened his eyes, and, as I used to call it, "came back to us" with an appearance of more than ordinary refreshment. It was evening, and I was anxious to hurry home for fear of the effects of the cool air.

"Not just yet," he said, in an expostulatory tone, "let me look a little longer on that sweet star; how softly bright it is; and how it keeps twinkling, as if it were alive. Papa, do not all things live?"

"Yes, my child."

"Then how can men, women, and children die?"

"They do not properly die, they only change from one state to another; it is in appearance, not in reality, that human beings perish; they all live to God, and they all live in God."

"Papa, will the next world be more beautiful than this?"

"Yes, dear, much more beautiful; besides, there is no pain, no sorrow, no death there."

"Oh, the death I should not mind if you, mamma, and Jane were there, particularly as the country is so beautiful; yet look, papa, how deep, calm, and holy is the blue sky in which that star shines so sweetly, as if it would invite us thither; if that is the way to heaven, I should like to go; but I feel weary, and then there is that old gnawing pain. Let us go home. One more look at the grand sea; the skies I can see as we go along."

The heats of the ensuing autumn proved fatal to Theophilus. As they increased in intensity, we were unable to leave the house until the evening breeze came with its refreshing softness. Soon all movement was impossible. The languor increased, the pains became more frequent and more bitter; the poor child was literally reduced to a skeleton. Yet did his mind retain its soundness, and at times manifest its strength, as if unimpaired. In a few days all was over. *What* was over? His higher faculties remained alive to the last. "My child"—so I said to myself—"has not died, it is only his bodily frame that has broken down." The evening of his departure we all sat by the side of his couch, intently watching, in the fear that every moment would be his last. Suddenly he opened his eyes, and, taking his mother's hand, which lay on his bosom, he said, "Thank you," "thank you all," "you have been very kind," "thank you every one," "I shall be alone, and I am sorry for that, but you will come after, and we shall be always together in that beautiful world." Hardly could he enunciate the last words, but sounds dwelt on his dying lips resembling "sea," "sky," "star," "Jane," "mamma."

MILTON ON HIS BLINDNESS.

It is said that Charles II., when urged by his courtiers to inflict some signal punishment upon Milton, the secretary of Cromwell, and the eloquent and intrepid champion of the commonwealth, inquired whether the man upon whom they invoked his vengeance was not old, blind, and destitute, and, on being answered in the affirmative, replied that he was already sufficiently punished in the condition to which he had been reduced. The following recently-discovered lines among the remains of the great classic bard, disclosing as they do the source and amplitude of his internal consolations, will show how far he was a legitimate object of pity to his relentless enemies —

I am old and blind!
Men point at me as smitten by God's frown,
Afflicted and deserted of my kind,
Yet I am not cast down.

I am weak, yet strong,
I murmur not that I no longer see,
Poor, old, and helpless, I the more belong,
Father Supreme! to Thee!

O merciful One!
When men are farthest, then Thou art most near,
When friends pass by, my weakness shun,
Thy chariot I hear.

Thy glorious face
Is leaning toward me, and its holy light
Shines in upon my lonely dwelling-place,
And there is no more night.

On my bended knee,
I recognise thy purpose, clearly shown
My vision Thou hast dimm'd that I may see
Thyself—Thyself alone.

I have nought to fear,
This darkness is the shadow of Thy wing,
Beneath it I am almost sacred—here
Can come no evil thing.

Oh! I seem to stand
Trembling, where foot of mortal ne'er hath been,
Wrapp'd in the radiance of Thy sinless land,
Which eye hath never seen.

Visions come and go—
Shapes of resplendent beauty round me throng,
From angel lips I seem to hear the flow
Of soft and holy song.

It is nothing now,
When Heaven is opening on my sightless eyes—
When airs from Paradise refresh my brow—
The earth in darkness lies.

In a purer clime
My being fills with rapture—waves of thought
Roll in upon my spirit—strains sublime
Break over me unsought!

Give me now my lyre!
I feel the stirrings of a gift divine,
Within my bosom glows unearthly fire,
Let by no skill'd [illegible]

AN ENIGMA SOLVED.

We have often thought, as we have passed through the busy thoroughfares of London, that it would be worth while to seek out the histories of some of the many beggars, quacks, and conjurers, with whose faces we had become familiar. Day after day, and week after week, through all the summer months, we had noticed at about the same spot in the Tottenham-court-road a man sitting on the pavement as the artist has depicted him. He was very ragged, and looked decidedly wretched. His hand, thin and white, supported a head that would be a study for a painter; while on the pavement by his side was drawn in coloured chalks the figure of a horse. We pressed among the crowd occasionally as we passed that way, to see if there was any change in our poor artist. No; there he was—pale face, way-worn and desolate expression, disordered hair, naked feet, rags, and picture, just the same. Sometimes, indeed, we watched him as he made his preparations for the drawing of the day. With elaborate care he swept a clean space on the flagstones and "covered it in," as the artists say, with a blackground of slate-coloured chalk. Then with a piece of charcoal he would make the outline of his figure—sometimes a horse, and at other times a child's head crowned with flowers; and we generally left him as he was "putting in the lights" with a lump of whiting and a dry finger.

We were decidedly interested. Here, thought we, is a poor artist reduced to extremest poverty, who, like another Claude, is obliged to appeal to the veriest crowd to obtain the wherewithal of existence. We had never heard him speak, but we had watched the silent eloquence of the hand and eye with which he received the gifts of the passers. Here was a miserable wretch, who with talents far above the average, was obliged to sit day by day in the streets and make his mute appeal to an indifferent public. We thought what a sad thing it must be for one so clever to be so hard pushed by fortune; and we tried to remember the names of the great men who had risen out of the lowest poverty to high and reputable stations—the Erasmuses, Kelpers, Johnsons, Hogarths, Fergusons, and Tassos of the past. Here was a problem in social economy which might be carefully worked out and solved: how would this man be best served? We wished we had been wealthy; but the mere gift of money we felt assured would not be the best means of rescuing this poor artist from his

THE STREET ARTIST.

depth of woe. The more we thought on the subject, the more puzzled we became; and we determined to speak to the poor fellow the next time we went that way.

Circumstances occurred, however, which prevented our carrying this intention into execution. We went out of town, and remained out for some weeks. When we returned, our first impulse was to seek our poor artist; and, if possible relieve him. We sought him in the old spot, but he was not to be found; we inquired of the policeman, but as he had only lately come on that "beat," he could give us no information; we made the Tottenham-court-road our way to and from town for several weeks,—thereby going at least half a mile out of our way; but all traces of our interesting friend had vanished.

It was very annoying that the end of the romantic little episode we had been constructing should be so suddenly cut off: but we consoled ourself with the fact, that at any rate our artist had bettered himself. Perhaps he had found a friend who had appreciated his talents, and rescued him from the streets; perhaps he had found reputable employment in the studio of some benevolent artist, or had even set up for himself! And we looked somewhat curiously into the shop windows of the printsellers to see if we could discover any chalk or water-colour drawings which were anything like his. Of course we saw several things of the kind, but they were all too careful in style, and wanted that free and easy manner we had noticed in the drawings on the pave. We were fairly puzzled.

Time passed on, as it usually does, autumn deepened into winter, and we had almost forgotten our poor artist, or, if we ever thought of him at all, it was with the congratulatory idea that he had obtained better employment, or he might have died of want—poor fellow!

It was on one of the coldest days in January that we happened to be passing through Euston-square, on our way from the North-western Railway. Having just come off a journey, of course we were becoated and beshawled in the most comfortable manner; and instead of riding home, we thought we would walk quickly through the bracing air. In fact, it was just the kind of weather when to stand still was to freeze, and to move rapidly about was to get into an exquisite glow.

Well, we were passing quickly through the square, as we said, when our path was slightly impeded by a little crowd assembled on the footway. Now we confess to a by-no-means-uncommon curiosity as to the meaning and purpose of street crowds. If there is a noisy, restless group in our way, with a drunken woman and a policeman in the midst, we are sure to push through to see what is the matter, and remonstrate with X 250 on his want of tenderness for the poor creature. if there is a "Punch" at the street corner, or a "Cheap Jack" holding forth in the suburbs on the virtues of Birmingham saws and Sheffield plate, we are almost certain to linger in the outskirts of the mob to see what is going on. And so, with the little crowd in our way, we naturally looked over a short man's head to see what it was attracted so many people on so cold a day. We looked—and you might, as folks say, have knocked us down with a feather! There, sitting on the ground, in the same attitude as ever, with the same expression on his pale face, and apparently clothed in the same rags, sat our quondam acquaintance, the artist. There was no mistake about the matter or the man; they were just what they had been in the previous summer—rags, hair, studied position, and chalk-drawing on the pavement precisely as before. We were completely taken aback—speechless with astonishment and disgust; and we turned away with the comfortable feeling that all our romance about the fellow's poverty had come to nothing, and that our poor artist was a professional humbug! To be deceived is a disagreeable kind of thing; but to discover that you have gone on deceiving yourself, is abominable. To find that our artist, for whom we had conjured up so many mind-histories, and upon whom we had wasted so much genuine sympathy, was nothing more than a sham;—it was very annoying

"WE ARE STARVING!"

But we determined, before we wholly condemned the man, to make inquiry. It might be—who could tell?—that he had never been able to lift himself out of his wretchedness. We will not, we thought, be unjust to him we will inquire. And it happened that before many days, we had an opportunity of inquiring at head-quarters: in fact, we were introduced to Sergeant Boosey, one of the most active and experienced of the London Detectives.

When we mentioned the matter to this worthy officer, and explained to him the interest we had taken in the poor artist,—not to mention the substantial help we had rendered him, in the way of shillings and sixpences,—we noticed a slight smile curl round the sergeant's mouth; and, before we had concluded our narration, we discovered that the smile had widened into an unmistakable grin of delight.

"Ha! ha! excuse my laughing, sir, but you're not the first individual who has been deceived in the appearance of Toby the Screever—"

"The what?"

"Oh," continued the worthy sergeant, "that's the cant name for begging-letter writers, painters on the pavement, writers of chalk petitions on bits of old hat, and all that sort of kidney. Why, bless you, sir, don't you know that it's a regular trade?"

We listened in a kind of silent wonder, as the sergeant went on.

"Why, so far from being clever at drawing, this fellow Toby, and plenty of others besides, has just learnt to make the figure of some animal, or to chalk a man's head on the pavement—that's all; and there he sits all day long, without we move him off to another road, leaning on his hands, and looking as wretched as if he were regularly starved—while the chances are, that, before he set out in the morning, he had a good rump-steak or a couple of mutton chops for breakfast, and that he takes home at least ten shillings in the evening, and makes merry with his friends. There's nothing deceives

a person more than these silent woe-begone-looking fellows. They don't beg, but they sit on the pavement and look up into the passengers' faces as if they were going to die of want Now, sir, just take my advice: if you have any spare money, and you are of a benevolent disposition, don't bestow your charity upon the beggars in the streets, but seek out some poor struggling people in your own neighbourhood, who strive to hide rather than publish their poverty, give your spare money to such as them, and depend upon it you will not often be deceived. Whenever you see a big fellow sitting on a door-step with his head on his hands, and a bit of paper with "I AM STARVING," chalked on it on the ground, make up your mind that he had a good breakfast in the morning, and that he will feast on a hot supper at night. If you only saw as much of this sort of thing as we do, sir, you wouldn't feel any great pity for the street folks. Of course, I don't mean to say but what there are deserving cases to be met with in the streets sometimes, but they are very rare indeed,—so rare, that when I see a strange face among the professionals, I always find out who it belongs to. Depend upon it, sir, that nine out of every ten of the London beggars make a profitable living of it, and would rather beg than work. The really poor people don't come into the streets with clean white aprons on, and half a dozen fresh-washed children, no, sir, they'd rather stay at home and die."

The words of the worthy sergeant made no slight impression on us, we are free to admit, and we no longer felt any great interest in the poor artist;—but we beg to remark that, after all, his was quite a policeman's view of the question.

CONTINENTAL NOTES, COMMERCIAL AND STATISTICAL.

CARPETS

THE carpets commonly called Brussels come in fact from Tournay, the art of weaving them having been brought to that place, according to tradition, from the east, by the Flemings, who served in the Crusades, and learned it from the Saracens The royal manufactory, though much fallen off, still occupies 90 looms, and gives employment to about 2,400 persons Vandermahn states that there are as many as 12,000 to 16,000 looms employed in the commerce of Tournay in the manufacture of woollen and linen goods thus must include stocking-looms a branch of industry carried on here, employing 2,500 looms.

BRUSSELS LACE.

Of the varied articles contributed by Brussels to the Great Exhibition of 1851, the most interesting were the specimens of lace, renowned throughout the world. The peculiarity, in addition to the fineness, which distinguishes it, is, that the patterns are worked separately with microscopic minuteness, and are afterwards sewn on. The great variety of beautiful specimens of lace exhibited formed a constant source of attraction, especially to the ladies It is said that the persons who spin the thread for the Brussels lace are obliged to work in confined dark rooms, into which the light is admitted but partially through a small aperture, and that, by being thus compelled to pay more constant and minute attention to their work, they discipline the eye, and attain the faculty of spinning the flax with that web-like fineness which constitutes the excellence of the [illegible] fabrics

There were two kinds of Brussels lace, *Brussels ground*, which has a hexagon mesh, formed by platting and twisting four threads of flax to a perpendicular line or mesh, and *Brussels application ground*, made of silk, with meshes partly straight and partly arched. The pattern is worked separately, and set on by the needle

The *Mechlin* lace is a hexagon mesh formed of three flax threads, twisted and platted at the top of the mesh The pattern is worked in the net.

There were specimens of Brussels lace exhibited, the thread of which is made being of such extreme fineness, that one pound of it costs as much as 3 700 francs (£160), but, as in the one-half of the costly article is wasted in the process of manufacture through not being sufficiently fine, the thread actually used becomes worth more than six times its weight of pure gold a striking exemplification of the manner in which labour imparts value to raw material.

THE TRADE OF BRUGES

Early in the 13th century, Bruges was the staple place of the Richly-laden argosies from Venice, Genoa, and Constantinople, might, at the same time, be seen unloading in her harbour, whilst her warehouses groaned beneath bales of wool from England, linen from Belgium, and silk from Persia The lace manufacture is the most important at the present day, 7,400 persons, or more than one-sixth of the population, being thus employed.

CUTTING DIAMONDS IN AMSTERDAM

The art of cutting diamonds was for a long time confined to the Jews of Amsterdam It is supposed not to have been known in Europe earlier than the 15th century. The diamond mills in Amsterdam are numerous, and are exclusively the property of Jews One of them is thus described by Mr. Elliott:—"Four horses turn a wheel, setting in motion a number of smaller wheels in the room above, whose cogs acting on regular metal plates, keep them constantly in motion Powdered diamond is placed on these, and the stone to be polished, fastened at the end of a piece of wood, by means of an amalgam of zinc and quicksilver, is submitted to the friction of the adamantine particles This is the only mode of acting upon diamond, which can be ground and even cut by particles of the same substance In the latter operation, diamond-dust is fixed on metal wire, which is moved rapidly backwards and forwards over the stone to be cut."

THE LOCOMOTIVE AND STEAM-ENGINE MANUFACTORY AT LIEGE

This colossal establishment was formed by the enterprising manufacturer, the late John Cockerill, in 1816 It is perhaps the largest manufactory of machinery in the world, and occupies the former Palace of the Prince Bishops of Liege, which now serves but as the façade or vestibule of other vast piles of buildings subsequently added. The manufactory forms a little town of itself, iron and coal are extracted from mines within its walls, which also enclose a canal and railroad leading down to the river, four blast furnaces, fifteen puddling furnaces, rolling-mills, and forges, where iron is wrought into articles of all sorts of goods, from a penknife up to a steam-engine and a locomotive, inferior only to those made in England From 3,000 to 4,000 workmen are employed at Seraing, in addition to fifteen steam-engines, equivalent to 700-horse power Mr Cockerill was originally in partnership with the late King of Holland, but after the expulsion of the latter from Belgium, Mr Cockerill purchased his share. Mr. Cockerill died at Warsaw in 1840, and Seraing has since been disposed of to a company styled, "La John Cockerill Societé," by whom it is now worked

THE LAMP UPON THE RAILWAY ENGINE.

A BALLAD OF COMPOSURE

SHINING in its silver cell,
Like a hermit, calm and quiet,
Though so near it, hot as hell,
Furious fires rave and riot
Posted as an eye in front,
'Mid the smoke and steam and singeing,
Steadily bears all the brunt,
The lamp upon the railway engine

So, thou traveller of life,
In the battle round thee crashing,
Heed no more the stormy strife
Than a rock the billows dashing
Through this dark and dreary night,
Vexing fears and cares unfounded aloft, alight,
The lamp upon the railway

By the oil of Grace well fed,
Ever on the future gazing,
Let the star, within thy head
Steadily and calmly blazing,
Hold upon its duteous way,
Through each ordeal unflinching,
Trimm'd to burn, till dawn of day,
The lamp upon the railway en

Safe behind a crystal shield,
Though the outer deluge drench us
Faith forbids a soul to yield,
And no hurricane can quench us,
No! though forced along by fate
At a pace so swift and savage,
Calmly shines the silver state,
Ye

POPULAR SUPERSTITIONS.

In very ancient times witches were much respected in all heathen countries, and it is on record in history that kings and oth great men usually consulted them before they undertook any affair of importance, and on such occasions were in the habit of inviting them to their houses, and entertaining them sumptuously As the light of the gospel, however, became diffused, respect for witchcraft diminished, but not the belief in its existence, and consequently we find that the utmost cruelty was continually practised against poor, helpless creatures, whose supernatural power to do mischief no one seemed for a moment to doubt At this same time too, animals and insects were suspected of being in league with witches to destroy the peace of human beings, and accordingly legal proceedings against them also were not unfrequent. In 1530, we are informed by a correspondent of a literary periodical, "the country around Autun, in France, was infested with rats, against whom the high criminal court might is necessary to proceed with all due form and gravity Thus cited, the rats were solemnly cited to appear, but, like Glendower's spirits of the vasty de they did not come. They were accordingly formally declared in default, advocates were named to appear in their behalf, the public prosecutor, on the day appointed, set forth the charge against them (that of devastating the corn-fields and vineyards), their advocates made the best defence they could, the judges seriously deliberated, and at length gave judgment, declaring the under the influence of witchcraft, and condemning them to be executed." About this period prosecutions of this kind were common in France, that there still exist among old law-papers forms of proceeding and pleading, *pro* and *con*, drawn up by some of the most renowned advocates of the day

In our own country, also, there are many documents which prove that we were ourselves not less superstitious than our neighbours. In the library of the University of Cambridge there is preserved a code of Anglo-Saxon laws, a few extracts from which will serve to give an idea of the whole.

"If any man destroy another by witchcraft, let him fast seven years—the three first on bread and water, and the other four on bread and water three days in every week

"If any man observe lots or divination, or keep watch at any wells, or at any other created things, except at God's church, let him fast three years, the first on bread and water, and the other two on Wednesdays and Fridays, on bread and water, and the other days let him eat meat, but without flesh

"The same for a woman who useth any witchcraft to her child, or who draws it through the earth at the meeting of roads, because that is great heathenness.

'He who uses anything that a dog or a mouse has eaten off, or a weasel polluted, if he do it knowingly let him sing one hundred psalms, and if he know it not, let him sing fifty.

'He who gives to others the liquor that a mouse or a weasel has been drowned in, if he be a layman, let him fast three days, if he be a churchman, let him sing three hundred psalms, and if he did it without his knowledge, but afterwards knew it, let him sing the psalter."

We need not make any further extracts from this document, but would now take a few from one which is preserved in the British Museum. It enumerates offenders who were "no Christians, but notorious apostates." Amongst others,

"He who endeavours, by any incantation or magic, to take away the stores of milk, or honey, or other things, belonging to another, and to acquire them to himself.

"He who, deceived by the illusion of hobgoblins, believes that he goes or rides in her company whom the foolish peasantry call Herodias, or Diana.

"He who makes his offering to a tree, or to water, or to anything except a church.

'He who places his child on the roof or in a furnace for the recovery of his health, or for this purpose uses any charms, or characters, or magical figment, or any art, unless it be holy prayers or the liberal art of medicine.

"He who shall say any charm in the collecting of medicinal herbs, except such as the 'Pater noster' and the 'Credo.'"

These extracts are enough to convince us that our ancestors were not surpassed by any nation upon earth in superstition, and yet there are stranger things than these on record. At the close of the sixteenth century, a vessel being wrecked on the coast of Norfolk, thirteen individuals were lost. A jury was summoned, and the following verdict was brought in:—"Misled upon the west coast, country from Spain, whose deaths were brought about by the devilish witchery of an old witch of King's Lynn, whose name is Mother Grabley, by the boiling or rather labouring of certain eggs in a pailful of cold water, afterwards proved at the arraignment of the said witch."

THE CAP OF LIBERTY

There are some peculiar ceremonies which, notwithstanding the lapse of ages, survive the passage of time, and are found, even in modern days, as freshly engraved on the memory, as earnestly guarded by popular prejudice, and as acceptable to the spirit of a free nation, as in the remote centuries of antiquity Amongst these, the use of that symbol of freedom, "the cap of liberty," stands foremost. In early times none but the free-born claimed the privilege of wearing a cap of this kind, and none dared to exercise it but one so entitled to enjoy it. Woe to the slave who had the imprudent hardihood to be seen covered! for the lash, the chain, and the brand soon made him repent of his neglect or his folly, whichever it might have been

In all countries the slaves were obliged to appear bareheaded, and whenever the day came that freedom was the reward of faithful servitude, one of the ceremonies used in the manumission of the slave was the placing of a cap on the head by the former master. Thus the cap or hat became the symbol of liberty, and was the standard around which the spirit of patriotism rallied in many a revolution. When the mandate of the tyrannical Gessler compelled the hardy sons of Switzerland to salute a hat placed upon a pole, as a mark of submission, the spirit of the nation was roused, the tyrant paid forfeit with his life for his insulting order, and the hardy mountaineers obtained that liberty which has since been so intrepidly preserved, and, accordingly, the arms of the united cantons of Switzerland have a round hat for a crest, as emblematical of that liberty so nobly struggled for.

In England the cap, with the word liberty inscribed on it in letters of gold, is used as a symbol of the constitutional liberty of the nation, and Britannia sometimes bears it on the point of her spear. This, however, is not always the case, as the figure of Britannia is often represented with the trident of Neptune uncapped in her left hand, while with her right she offers the olive-branch of peace to the world

In France, in the beginning of the revolution of 1789, the cap of liberty was hoisted as the symbol of freedom; but, when the bloody exploits of the remorseless Directory filled France with terror and dismay, there were but few that regarded the cap of liberty with a favourable eye. It was during this melancholy period that the red cap was adopted, from the following circumstances:—For many years the kings of France sent those condemned for crimes and serious political offences to the galleys at Marseilles, and there, chained to the oar, they dragged out a wretched and abandoned existence, in the polluted atmosphere of a society stained with crimes of the deepest dye. However, when the revolution opened the prison-doors, and burst the chains of the galley-slaves, the red cap worn by the liberated convicts was elevated as the standard of freedom, and borne by them as they marched in hundreds to Paris, the ready tools of the wicked men who then held the reins of power. On late occasions, when the revolutionary spirit of the times nearly upset every throne in Europe, except that of happy England, the red cap was chosen by the republicans, and the red flag was the ensign of the assembled revolutionists. When jacobin clubs were rife in Paris, the red cap was also made the badge of membership, and hence often known under the title of the "jacobin cap." In the last-mentioned instances, however, the cap of liberty has certainly been used in a sense different from that originally attached to it, as in olden times it was solely used in the manumission of slaves. But its adoption in England on the spear of Britannia is just and well deserved, as in that favoured land slavery lives not, and the moment the bondsman sets foot on British soil he is free for ever

The Grave.—It buries every error, covers every defect, extinguishes every resentment From its peaceful bo... none but fond regrets and tender recollections Who can look down upon the grave of an enemy, and not feel a compunctious throb that he should have warred with the poor handful of dust that lies mouldering befor

THE SCOTCH COLONISATION OF IRELAND IN THE SEVENTEENTH CENTURY.

THE question of Irish amelioration—the "great difficulty" of all British governments—is attracting the attention not only of philanthropists and statesmen, but also that of capitalists. The *Glasgow Daily Mail*, a newspaper of considerable standing in the North, a series of articles on the subject have appeared, from one of which we glean the following interesting particulars:—

Soon after the accession of James the First to the English throne in 1603, a memorable event occurred. This was the colonisation of Ulster, in Ireland, by a body of Scotsmen, from Ayrshire. The leader of this enterprise was Hugh Montgomerie, sixth laird of Braidstone, in the parish of Beith—a branch of the Montgomeries of Eglinton. Braidstone appears to have been a man of more than usual sagacity. The insurrectionary disturbances in Ireland before Elizabeth's death had placed a vast deal of confiscated property at the disposal of the Crown. The laird saw that the sister island would be a good field for exertion. Standing in some favour at court, through the medium of his brother George, who was chaplain to his Majesty, he kept his eye steadily fixed on Ireland; and, with the view of facilitating the great enterprise he had in contemplation, he resolved on effecting the escape of Con O'Neil, the chief of Ulster, who had long been a prisoner in the Castle of Carrickfergus. This he accomplished; and, in consideration of the laird having secured his escape, and also of procuring his pardon at court, and keeping him in quality of an esquire, as well as maintaining his followers "in their moderate and ordinary expenses," O'Neil "granted and assigned one-half of all his land estate in Ireland to enure to the only use and behoof of the said laird, his heirs and assigns." On the completion of this agreement, O'Neil and the laird went to Westminster. O'Neil received pardon of the king, the laird was knighted, and orders were given that the agreement betwixt them should be confirmed by letters patent, under the great seal of Irelond, "at such rents as therein might be expressed, and under condition that the lands should be planted with British Protestants, and that no grant of fee-farm should be made to any person of mere Irish extraction."

Subsequently, however, the laird (then created Sir Hugh Montgomerie) obtained from O'Neil a deed of feofment of all his lands. This was in the winter of 1605. Sir Hugh was then in Dublin completing his arrangements. From Dublin he went to Downshire, to take possession of his property, and afterwards, in order "to engage planters to dwell thereon," returned to Braidstone.

By May, 1606, the plantation had begun. The north of Ireland was covered with waste land like the "backwoods" of America, but it was not encumbered with great woods to be felled and grubbed to the discouragment or hindrance of the settlers. In all the three parishes of Donaghadee, Newtownards, and Grayabbey, 30 cabins could not be found, nor any stone walls, but ruined, roofless churches, and a few vaults at Grayabbey, and a "stump of an old castle," in Newtown, "in each of which some gentlemen sheltered themselves at their first coming over." The "stump of a castle" was made shelter for Sir Hugh and his family, while the rest of the colony "speedily made cottages for themselves, because sods, and saplins of ash, elder, and birch trees, with rushes for thatch, and bushes for wattles, were at hand" A great part of the supplies of the infant colony was obtained from Scotland. There was a "constant flux of passengers," and people went from Stranraer with their wares and provisions to the market at Newtown, though the land journey to and fro was upwards of twenty miles, besides three hours' sail.

Sir Hugh and his lady setting a noble example of activity and industry, the colony made rapid progress. Stone houses, streets, and tenements rose as it were out of the ground, and these dwellings became a town immediately. The harvest of 1606-7 was so abundant that the colonists had enough and to spare for the succeeding new-coming planters. This plentifulness encouraged the erection of water-mills in all the parishes, "which prevented the necessity of taking meal from Scotland and grinding with quern-stones, both which inconveniences the people at their first coming were forced to undergo.

Lady Montgomerie had also her farms at Grayabbey and Comber, as well as at Newtown, to supply new comers and her own house; and she easily got men for plough and barn, for many came over who had not stocks to plant and take leases of land, but had brought a cow or two and a few sheep, and she gave them grass and so much grain per annum, and a house and garden-plot to live on, and land for flax and potatoes as they agreed on for doing their work. And this was but part of her good management, for she set up and encouraged linen and woollen manufactures, which soon brought down the prices of the breakens (tartans) and narrow cloths

Everybody minded their trades, and the plough and the spade—building, gardening, and setting fruit trees in orchards and delving and ditching in their grounds, occupied the people. The old women spun, and the young girls plied their nimble fingers at knitting. Everybody, in short, was busy. There was no strife nor contention—no querulous lawyer, nor Scottish nor Irish feuds between clans and families disturbing the tranquillity of the colony; and towns and temples were erected and other great works done even in those troublesome times.

As a proof of the rapid progress of the colony, it is mentioned that in 1610, only four years after the first planting, the laird (who was now created Viscount Montgomery of Ardes) brought before the king's muster-master a thousand able fighting men.

The success of this Scottish enterprise led to the formation of the London Companies in 1612, and thus was founded and arose the Protestant province of Ulster, which, says Hume, from being "the most wild and disorderly province of all Ireland, soon became the best cultivated and most civilised."

King James is said to have frequently boasted of his management of Ireland, as a masterpiece of sovereignty; and his vanity in this particular was not altogether without foundation. Sir John Davis says that, in the space of ten years, the measure adopted by James for colonising Ireland, did more for the reformation of that kingdom than had been accomplished in the 440 years which had elapsed since the conquest of it was first attempted. Still to the "more than usual sagacity" of the Laird of Braidstone, who first conceived the idea, and led the way, must we award a considerable share, if not the chief merit, of the Protestant colonisation of Ireland

The history of the enterprise is exceedingly interesting. It presents a pleasing picture of the work of colonisation, and excites a strong feeling and wish to imitate the example and engage in a similar enterprise in the present day We should profit by the lessons which history teaches Scotchmen and Englishmen are emigrating to the remotest quarters of the world, and are helping rapidly to colonise Canada, Australia, New Zealand, and other parts. But may they not colonise successfully nearer home? To be sure, there are no confiscated lands in Ireland in the hands of the crown now, as in the days of King James, but there are large fertile tracts on the west coast of Ireland, indented with noble firths and harbours, teeming with all kinds of fish, which tracts may be purchased in the Encumbered Estates Court at low prices, capable of the greatest improvement, and only requiring the exercise of ordinary skill and industry to convert them into fertile and productive lands. The nearest point of Europe to America, it needs no gift of prophecy to foretell that some part of the west of Ireland must needs be the landing-place and point of embarkation between the Old and New Worlds. The goldfields of Australia and California may have their attractions for those who esteem gold as the only riches; but a finer field for genuine enterprise and exertion in the reclamation of waste lands, and improvement of agriculture, the introduction of manufactures, and creation of trade, shipping, and commerce, nowhere exists than in the west of Ireland. The late Sir Robert Peel had this idea, or he would not have propounded his plan for colonising Ireland in 1848, after the manner of the London companies of 1612, nor have endeavoured to stir up the corporation of London to embark in the scheme; nor would a body of London capitalists have raised, as they have done, half a million sterling for investing in the purchase of lands in the west of Ireland, were they not satisfied that such an investment is likely to turn out as substantial an undertaking as any gold-mining adventure whatever. His Royal Highness Prince Albert, it is believed, looks with favour on all projects for the improvement of Ireland; and

were a company established for the extensive colonisation of the west of Ireland, whether by Scots or Englishmen, it may be presumed that the government would bestow its countenance and patronage on the scheme.

There are about sixteen millions sterling deposited in the Scottish banks, yielding only at the present time two per cent. interest. Should this land investment company give only two-and-a-half per cent., it would be an inducement to withdraw a portion of the bank deposits, and transfer them to this company, which would then be the Irish Land Savings Bank of Scotland.

HOW HARRY BONNER REDEEMED THE PAST.

Bonchurch, in the Isle of Wight, is a picturesque village on the upper cliffs of Ventnor. Here, some few years since, lived a poor schoolmaster, who rented a cottage of two rooms for his dwelling, and a barn for his school. He was self-educated in the common elements of knowledge, and had made the human heart his study; and it was his delight not merely to teach the mechanical parts of reading, writing, and arithmetic, but also to influence the moral and intellectual powers of his children, and to strengthen, elevate, and purify them. In this large aim, he had but one text-book—the Gospel of the Great Teacher, and in this he learned one lesson in especial—that "it is good to seek and to save that which is lost."

Like all of his order, the master in his school had to contend with boys who could not learn, and boys who would not learn. But the boy who gave him most trouble, could and did learn, only he was so intractable in his general conduct, and so mischievous, that it was a ceaseless perplexity with the good master what ought to be done with him. The master had no worldly motive for reclaiming so difficult a charge, since he gained not a penny by it, but he felt a Christian yearning towards a lad, who was an orphan, and who was not without promise of better things.

"Harry, Harry, look in my face, sir," exclaimed the master one day, in one of his very sternest tones.

Harry lifted up a bold, handsome, and always dirty face, surmounted by a tangled mesh of dark curling hair, and made a comic grimace, but when his bright rolling eye met with that of the master, he glanced aside, as if something pained him.

"Harry Bonner, you were last night stealing Farmer Watson's apples."

"Was I, master?"

His tone of mock innocence and simplicity excited sudden laughter in the school, and the frown of the master could scarcely check it.

"Yes, you were, sir, and I tell you, Harry," said the master, solemnly, "if you go on in this way, you will come to some sad end."

"I hope not, master."

A stout leathern strap was produced.

"Hold out your hand," said the master.

"No, thank you, sir."

"Hold out your hand!"

"Rather not, if it's all the same to you, sir."

"I insist!"

The hand was held out firmly, Harry winking hard; the strap descended, and then with an affected howl, ending in the laugh of a young savage, the culprit went back to his form—only to plan new offences.

"I feel this is not the way to reclaim that boy," said the master, after school hours, to his sister, an invalid dependent on him, who sat all day long in a wicker easy-chair, generally employed in knitting dappled-grey worsted stockings, "yet what else am I to do with him? he is excessively hardened, full of courage and cunning; I never met with a boy so precociously wicked, everybody prophesies evil of his future life. He defies restraint. In any quarter, all the boys fear him, but he fears no one. He invents wild fun enough for all the mischievous boys in England. He has robbed every orchard within ten miles, and really, I often fancy, he does it out of mere love of adventure and peril."

"Your strap will do him no good," said the sister, quietly.

"What then will?"

"Patient kindness, and instruction, and time."

"Why, does he not know that I have almost paid his uncle the blacksmith to let him come to school—that I send him vegetables out of my garden every now and then, to keep him in good humour?"

"Harry knows you are his only true friend, and thinks more of a gentle word from you than of all your blows with the strap. He has far too much of violent usage at home."

"That is true; you are right."

One forenoon, Harry Bonner left his seat at the head of the high form, flung his book aside, and planted himself at the window, whence he enjoyed a view of the sea, and a man-of-war that had approached near the shore, in order, as Harry heard it rumoured, that its crew of seamen for the French war might be recruited by forcibly impressing men along the coast.

Harry was engaged in easy contemplation of this prospect, when the master espied how he was passing his time.

"What are you doing there, Harry Bonner? Where is your book? Have you learned your lesson?"

"No."

"Then, sir, you shall learn a double lesson before dinner."

"I like double lessons," said Harry, flinging himself back to his place, and learning rapidly a long row of words and meanings. Before dinner-time had come the double task was perfectly mastered, and hard sums got through—for sums and lessons were all play to Harry.

The master looked at him with feelings of pity, regret, and admiration.

"Oh, my poor boy!" said he, "how can you throw away such abilities on mischief and wickedness?"

Harry coloured up to his temples, his eyes flashed and moistened, he was going to make a passionate reply, but turned short round, and went out of the school whistling, with his hands thrust among the marbles and whipcord in the pockets of his ragged corduroys. Beside the pool, in the centre of the village, he stopped, and looking jealously round, and seeing he was unobserved, he pulled out the marbles and a top from his pocket, and flung them into the water. "There," said he, "now I shall give up nonsense, and show the master, and show everybody, what I can do. I am thirteen years old, and shall soon be a man, and I must look out for myself, as the master says I am clever, and all that, and so I *am* clever, and *have* got abilities—I feel it, that I do!"

He walked on, still talking with himself, presently he burst out—"What does uncle hate me for, I should like to know? What harm have I done him? What's he always thrashing me for? why don't he let me alone?"

Again he went on, every now and then loitering to think.

"I wish," said he, turning his pockets inside out, "I only wish I had some money there."

With this wish fresh on his lips, he went into the dirty cottage of his uncle. It was a homestead that did anything but credit to its occupants. The floor was unswept, and the hearth covered with coke, and potato peelings, the remnants of a dinner of the meanest kind were scattered over the tables. The boy felt disgusted, as he mentally compared this abode with the neat, though equally poor home that he had just quitted. He looked at his aunt, sitting in a dirty cotton gown, and discoloured cap, in the chimney-corner, and compared her with the schoolmaster's suffering sister, who ever looked so neat and clean.

The passion for change and improvement that had been silently taking root in Harry's breast, was momentarily becoming more developed. All at once, he said to his aunt,—

"Aunt, can you give me a little money—ever so little?"

"Money!" she looked at him in utter surprise. "What do you want with money?"

"Never you mind, only see though if I don't pay you back, one day, and plenty to it."

A violent blow from behind sent the boy reeling against the wall. There stood his savage uncle, with his fist doubled, bare grimy arm, and face distorted with intoxication.

"I'll teach you to ask for money," said he, and other blows and fierce abuse followed.

The boy started forward into the centre of the room, gazed with steady boldness in the tyrant's face, and said,—

"You have done nothing but ill-use me since my father died. I have never done you any harm, and I shan't bear any more of it."

The blacksmith caught up a heavy stick. "Will you not?"

"No, I will not, so take care what you are about."

"I'll break your spirit, or I'll break every bone of your body."

"You won't do either."

"We'll try that."

The blacksmith rushed forward to grasp Harry by the collar, and Harry sprang to meet him with wild resistance. They stood foot to foot, and hand to hand, wrestling for the mastery, when the door opened, and the master of Bonchurch entered. Instinctive reverence for the good man made the blacksmith pause, and the boy broke out from him, trembling violently, and now subdued to tears.

"I am sorry to see this," said the master. "What is the matter?"

The blacksmith muttered something, and his wife took the stick from his hand.

"They are always quarrelling," said she.

"What have I done?" exclaimed Harry; "but it don

master I like *you*—you have been good to me, and I shall think of it; but as for *him*, I hate him, and despise him, and I have nothing to thank him for, and after this day I will no[illegible] n, nor eat of his bread."

In an instant the lad was gone.

Some hours after, the master returned home, and the first thing he did was to take his strap from a table, and put it in the fire.

His sister smiled, but said nothing

After they conversed respecting the poor boy, and the master expressed some uneasy apprehensions as he repeated Harry's words on going off. Those apprehensions increased [illegible] became known through the village that Henry Bonner was missing, and could not be found.

At dusk, the villagers were traversing the road with lights, [illegible] old upper road which, viewed from the lower cliffs appeared but as a lofty terrace cut on the green mount side.

At that time the now flourishing town of Ventnor had scarcely begun to exist, only a few houses relieved the picturesque wildness of the scenery, amidst which the shouts of the villagers found an exciting accompaniment in the dash of the waves among the numerous breakers, and the fury of an equinoctial gale

Up and down the steep accivities of that old road, winding about the face of the upper cliff, did the villagers continue moving with their lights until long past midnight, for the parting threat of the boy had caused a general belief that he had committed some rash act—perhaps thrown himself over the cliffs or into the

What else could have become of him? He had neither money nor food, nor clothes, nor friends, nor any hope or help of any kind, that any one knew of, out of Bonchurch One person hinted at gipsies, another at smugglers, and the bold, erratic character of the boy made the master fancy that he had joined one or the other But gipsies had not been seen in Bonchurch for many months, and the smugglers of that part of the island were well known to the residents, and on good terms with them, and they denied any knowledge of the boy.

Gradually the search ceased, except on the part of the schoolmaster, who walked in every direction, inquiring and examining But at last he, too, lost hope, and as he stood in Ventnor Cove when a stormy night was darkening around, and the winds and

Henry Bonner was lost for ever

* * * *

Twenty years rolled away, and the disappearance was still a profound m[illegible]ry.

The blacksmith had died of intemperance, and no one lamented him The schoolmaster's sister needed nothing more in this world. Most of Harry's schoolmates were dead, and of those who survived, scarce any remained in the village All was changed but still the schoolmaster lived in his humble cottage, and kept school But he was grown old, and s[illegible] poor, that he was almost reduced to a shadow with hard living

In his best days, he had eked out his little income by cultivating a few vegetables and common fruit, and this was still his resource when he could hobble out on fine days into his patch of garden-ground.

His spirit had been unusually depressed by the decline of his strength, his poverty, his forlorn condition, and the memory of his sister, when at sunset one day he stood at his schoolroom window, looking towards the sea. The lattice was open, for the weather was warm, and his withered face felt refreshed by the breeze that played over it.

But that which chiefly detained him there, and held him in a kind of fascination, was the unusual appearance of a ship of war —one of the most imposing size—moored near Ventnor

The old man's memory was quickened by the spectacle, and he thought of Harry Bonner, who on the day of his disappearance had been detected by him watching such a vessel from this window, while his neglected lesson was flung aside on the form

Gazing and musing, the master stood while the shadows of twilight gathered over the scene, the masts and rigging—the chief object of his attention—grew indistinct, darkness came quickly, and with it a storm which had been in preparation for some hours

The master hastily closed the lattice as a flash of lightning broke in upon his musings, he turned to leave the schoolroom, and to enter his cottage—but what figure was that which, amidst the obscurity, appeared seated on the identical spot, on the chief form, where Harry Bonner sat when he learned with such surprising rapidity his double lesson, after watching the man-of-war from the window?

The schoolmaster had grown nervous, and rather fanciful, and I know not what he imagined it might be, but his breath came quicker and short for an instant, and then he asked in a faint voice, "Who is there?"

A manly voice replied, "Only Harry Bonner!"

The lightning lit up the whole of the large, dreary-looking schoolroom, and revealed to the schoolmaster the figure of a naval officer, on whose breast glittered decorations of rank and honour

Darkness instantly succeeded, as the officer started from the form, and grasped the hand of the master with a strong and agitated pressure, then the two moved quickly and silently together into the cottage, while the thunder crashed overhead

[illegible] the moment confused the faculties of the old man, and as the officer, still holding his hand with that fervent grasp, gazed in his eyes by the [illegible] of the cottage, he uttered some incoherent words about Harry Bonner, and the ship, and the double lesson, but when he beheld the officer cover his

his disengaged hand, and weep, his brain rallied its disordered [illegible] he lighted a rushlight that stood on the mantleshelf [illegible] officer withdrew his hand slowly from his face, the master passed the light before those brown and scarred, yet handsome features, in whose strong workings of feeling [illegible] else, he almost recognised his long [illegible]

The officer suddenly clasped the [illegible] "My dear old master!" he exclaimed

The old man was too weak for the sudden surprise, he put his hand to his brow, gazed vacantly, gasped for breath, and his lips moved without a sound

The officer placed him tenderly in the old wicker chair, in which the knitter of the dappled grey worsted stockings used to sit, then the old man grasped one of his arms, and looking up, said, mournfully, and shook his head,—"She is not here, she said to the last Harry Bonner would be found some day And now she is not here!"

"Dead!" is she?"

"O yes!"

There was a short silence—solemn and sad

"And why hast thou hidden thyself all these years?" asked the master.

"I have been 'redeeming the past,' I have been working my way from rags and infamy to this,' showing a full and heavy purse, "to revenge myself for the stick and the strap, and make thy latter days easy, my old benefactor"

"The change seems wonderful to you, no doubt," continued the officer, after an agitated pause,—"it is wonderful to myself, but [illegible] endeavours to reclaim me—your observations on my wickedness—your encouraging praise of my abilities—all appealed to my heart and conscience, and stimulated and roused me to resolve on going to sea, and trying to lead a new life The sight of the man-of-war from the window, and the last flogging I had from the blacksmith decided me I ran down the cliffs—I told my tale to a boat's crew of the war-ship—I was taken on board as a cabin-boy—the ship sailed directly I rose step by step—I have been in many battles, and here I am—a commander of the vessel

[illegible] found my way to the old [illegible] at."

"And I hope," said the master, earnestly, "I hope, my dear Harry, you are thankful to that Providence which has guided your wandering feet through paths so strange and difficult"

"I trust I am!" rejoined the officer, with profound reverence

"And now, does my uncle live"

"He and your aunt died fifteen years since"

"I am sorry for it. I should have liked to have talked with them of our past errors—theirs and mine It would have gratified me to have done something for them, and to have heard them retract some of their harsh words to me. How my heart warmed to the old village when I entered it just now! I could have embraced the mossy palings, I could have knelt down and kissed the very ground But I was so impatient to see if you lived, that I paused nowhere till I reached the school door, and found you gazing at my ship"

"You have brought back the heart of Harry Bonner," said the master, "whatever has become of his vices."

"You shall find I have, for whatever money can procure, or affection or gratitude bestow, for your health and comfort shall be yours from this hour, my dear old master"

ENGLISH CONVERSATION.—The superficiality and insipidity of nearly all the conversations to which I have listened, or in which I have joined, is really depressing As far as I hear, little is said [illegible] but politics, which is a good thing, much better than our Ger[illegible] for going beyond our depth on such subjects, but that narrative and commonplaces form the whole staple of conversation, from which all philosophy is excluded,—that enthusiasm and loftiness of expression are entirely wanting, depresses me more than any personal neglect of which, as a stranger, I might have to complain, for of this my share is not large, and I bear it easily.—*Niebuhr's Life and Letters.*

ANTIQUARIAN MEMORANDA.

CURIOUS MAYOR'S FEAST.—The following bill of fare for the feast on the election of mayor, in the reign of Queen Elizabeth at Norwich, in the year 1561, has been copied from an old newspaper, and may not be uninteresting —

	s	d
8 Stone of beef (14 lbs. to the stone)	5	4
4 Collared brawn.....4d each	1	4
4 Geese.....4d each	1	4
8 Pints of butter	1	6
Fore-quarter of veal	0	10
Hind-quarter of veal	1	0
2 Legs of mutton	0	6
Loin or saddle of mutton	0	6
Shoulder of veal.		
Breast and co		
6 Plove		
14 Brace of partridges	7	0
2 Guinea pigs	1	8
8 Fowls.....	2	0
12 Mallard.....3d each	3	0
3 Dozen of eggs.....4d per dozen	1	0
2 Baskets of flowers	1	0
10 Loaves of white bread.....	0	4
18 Ditto	0	9
3 Mashu ditto.....	0	3
1 Barrel of strong beer	2	4
1 Ditto	1	0
1 Quarter of wood	2	2
Nutmegs, mace, and cinnamon	0	5
1 lbs of Barberries and sugar.....	1	6
Fruit and almonds.....	0	0
12 Dozen of oranges	3	0
Sweet-waters and perfumes	0	4
2 Gallons of white wine	1	0
2 ditto of claret	1	0
5 Ditto of sack	3	0
1 Ditto of Malmsey	1	8
1 Ditto of bastard	1	0
Ditto of Muscodine	1	0
Total	£2	13 11

—At the same dinner, the following speech was delivered It forms a great contrast to the lengthy ones spoken in our own day The orator was Mr Johnny Master, a wealthy citizen of that city —"Maister Mayor, and may it please your worship, you have feasted us this day like a king God bless the queen's grace, we have fed plentifully, and whillon (whilst) I can speak plain English, I heartily thank you, Maister Mayor, and so do we all Answer, boys, answer, bravo, bravo!' Your beer is pleasant and potent, and will soon catch us by the caput, and stop our manners, and so here's for the queen's majesty's grace, and all our bonny-browed dames of honour. Huzza for Maister Mayor and our good dame mayoress Huzza for his noble grace of Norfolk—there he sits, God bless him! Huzza for all this company, and all our friends round the country, who have a penny in their purse and a English heart in their bellies, to keep out Spanish Dons and Papists, with their faggots, to burn our whiskers Handle your jugs! shove it about! trout your caps, and huzza for Maister Mayor, his brethren, their worships, and all this jolly company!"

ORIGIN OF BANKS.—Banks, now so useful, were of Venetian invention, and the first was contrived about 1150, to assist in the transaction of a loan, and called "The Chamber of Loans" It soon became the celebrated bank of Venice, and conducted all money transactions The plan was carried into foreign countries, and the projectors being called Lombards, the great banking street in London is to this day called Lombard-street Itscelebrityled to the establishment of similar public banks at Barcelona, in 1401, at Genoa, 1407, at Amsterdam, in 1609, in London, 1694, at Edinburgh, 1695, and at Paris, in 1716 The bank of England is managed by a governor, deputy, and 24 directors, with about 1,000 clerks

HISTORY OF CHURCH BELLS.—The antiquity of the bell for holy uses is undoubted We read in the instructions given to Moses on the Mount respecting the garments of the priesthood (Exodus xxviii), it is specified that there should be set a golden bell and a pomegranate alternately on the hem of the garment round about; the use and intent of these bells being to give intimation when the priest goeth in unto the holy place before the Lord, and when he cometh out—(verses 34, 35) Bells also were used in the earliest ages for secular purposes In the heroic age the Grecian officers visited the sentries with a bell as a signal for watchfulness. A bellman (*odonophorus*) walked some distance before funeral processions. We read that bells were used on the camels that took Joseph away when sold into bondage by his brothers. Their first [illegible] is we at present [illegible] and others to Paulinus, Bishop of [illegible] the year A.D. 400. If for no other cause, we must thank them as the means whereby we gained the tower, steeple, or belfry, to church architecture, which, while it confers a finish, is so especial a mark of the building being set apart for the worship of the Most High. Sir Henry Spelman quotes in his glossary two old monkish lines, which admirably describe their uses

> "Laudo Deum verum, plebem voco, congrego clerum,
> Defunctos ploro, pestem fugo, festa do coro"

The deprivation of them was and is considered still a great disgrace a public calamity Henry V took, as a mark of his triumph, the bells of Calais, and bestowed them on his native place, Monmouth Probably they were numerous and rich formerly in the wel endowed churches of the East, but the Moslem hordes forbad their use, and melted down the sanctified metal for baser purpose As yet we have been unable to discover the date of their use in th Kesrowan, though it is not very ancient, probably, however, it no exclusively possesses this privilege, elsewhere this holy sound hushed No holy summons

> "Bid the sons of mirth be glad,
> And [illegible]
> To the

ORIGIN OF THE NAME PICCADILLY.—Piccadilly is sh a map of London, of the time of Queen Elizabeth, as a rudel defined road out of the town, with one or two houses at the ang where the road, which afterwards became Regent-street, turne off, and a windmill a little to the east of this, the recollection which is still preserved in Windmill-street The origin of th name seems uncertain, but it was thought by some at the com mencement of the seventeenth century, when it was equally as no a matter of doubt, to have been given to a noted house there being the skirt or fringe of the town—a *picardill* having been kind of stiff collar or fringe to the skirt of a garment

LITERARY NOTICES.

THE ILLUSTRATED EXHIBITOR AND MAGAZINE OF ART.—Th first Volume of this splendidly embellished work, handsomely boun price 6s 6d, or extra cloth gilt edges, 7s. 6d, will be ready July will contain upwards of Two Hundred Principal Engrav Engravings, Diagrams, &c Th literary matter will be of the most varied and interesting description and the volume, considering the enormous cost of its production will certainly be one of the cheapest ever issued from the press

SUPERIOR EDITION OF THE POPULAR EDUCATOR.—No publicatio has ever been welcomed with such tokens of approval from heads families as the POPULAR EDUCATOR A circulation of nearly o hundred thousand has already been attained. To meet the urgen wishes of numerous families and individuals, JOHN CASSELL h determined to publish an EXTRA EDITION upon superior paper, at 1½ per Number, or in Monthly Parts, containing Four Numbers in neat wrapper, 7d, or when Five Numbers, 8½d This EXTRA Editio will be published without the weekly headings Persons wishing have this superior paper edition, must give their orders express for "*the Extra Edition of* THE POPULAR EDUCATOR," they w otherwise receive the common edition The First Part of th EXTRA Edition is ready, price 7d, and all the Numbers may b obtained, price 1½d each

The EMIGRANT'S HANDBOOK, a Guide to the Various Fields Emigration in all Parts of the Globe, is now ready, price 6d

SCRIPTURE LIBRARY FOR THE YOUNG, in Shilling Volumes —Th first two volumes of this instructive series of works, "The LIFE Joseph," illustrated with sixteen choice engravings and maps, an "The TABERNACLE, its PRIESTS, and SERVICES," with twelve engrav ings, are now ready.

COMPLETION OF JOHN CASSELL'S LIBRARY.—This invaluable Wor is now complete, in 25 Volumes, 7d each in paper covers; doubl Volumes, cloth, 1s 6d, or when 3 Vols in 1, 2s 3d The entire Seri may be had, bound in cloth, 19s, or arranged in a LIBRARY BOX, 25s Contents—HISTORICAL WORKS —The History of England By D R Ferguson 4 vols History of Scotland By Dr. R Ferguson 3 vol History of Ireland. 3 vols The History and Sources of the Greatnes of the British Empire By Benjamin Parsons 1 vol The Histor of France 3 vols SCIENTIFIC WORKS —The Natural History Man. By J Kennedy 2 vols The Wonders of the Heavens By F S Williams 1 vol. The History of the Steam-Engine By Pro fessor Wallace 1 vol VOYAGES AND TRAVELS.—Sailings over th Globe 2 vols Footprints of Travellers in Europe, Asia, Africa, an America 2 vols.

MISCELLANEA.

PUZZLING EPITAPH.—The following curious epitaph was found in a foreign cathedral —

EPITAPHIUM.
" O quid tum
be est bim
ra ra ra
es et in
ram ram ram
ii."

The following is plainly the solution of the last four lines —

ra, ra, ra, is thrice *ra,—i e , ter-a-r= terra.*
ram, ram, ram, is thrice *ram,—i e., ter-ram,*
et in is twice,—*i e., i bis=ibis.*

Thus the last four lines are,—

" Terra es et in terram ibis "

The first two lines may be thus rendered — " O *super* be, quid *super* est, tum super bim ;" which will be,—

" O superbe quid superest tum superbim
Terra es et in terram ibis."

" O proud man, what remains of thy pride ?
Dust thou art, and unto dust returnest."

THE ROSE.—Professor Agassiz, in lecture upon the trees of America, stated a remarkable fact in regard to the family of the rose, which includes among its varieties not only many of the beautiful flowers which are known, but also the richest fruits, such as the apple, pear, peach, plum, apricot, cherry, strawberry, raspberry, blackberry, &c.; namely, that no fossils of plants belonging to this family have ever been discovered by geologists This he regarded as conclusive evidence that the introduction of this family of plants upon the earth was coeval with or subsequent to the creation of man, to whose comfort and happiness they seem especially designed by Providence to contribute.

THE FOREIGNER IN ENGLAND —The fact that a foreigner can walk altogether unquestioned, without passport or delay, from John o'Groat's House to the Land's End, has made many persons doubt the security of life in England. A Berlin professor is said to have been quite angry about it. " One goes about in England," said he, " as though expelled from society. No official takes the least notice of one. The dogs are more respected in Berlin. They are all entered and numbered in the dog-book of the police. None but a thief can feel comfortable in England, for he is the only one of whom the government takes notice." The German professor seems to have possessed quite a theoretical prejudice.

HONOUR —Said one gentleman of honour in New York to another, " If you don't accept my challenge, I shall post you in the papers." " Go a-head," said the other. " I had rather fill a dozen papers than one coffin."

A FEW WORDS FOR THE LITTLE GIRLS.—Who is lovely ? It is the little girl who drops sweet words, kind remarks, and pleasant smiles as she passes along,—who has a kind sympathy for every girl and boy she meets in trouble, and a kind hand to help her companions out of difficulty,—who never scolds, never contends, never teases her mother, nor seeks in any way to diminish, but always to increase her happiness. Would it not please you to pick up a string of pearls, drops of gold, diamonds, or precious stones, which never can be lost ? Take the hand of the friendless,—smile on the sad and dejected, —sympathise with those in trouble.

DIGNITY OF THE AMERICAN PRESS.—The editor of the *American Mechanic* has encountered trials unknown to ordinary men. Hearken unto his wailings — " Owing to the facts that our papermaker disappointed us, the mails failed, and deprived us of our exchanges, a Dutch pedler stole our scissors, the rats ran off with our paste, and the devils went to the circus, while the editor was at home tending babies, our paper was unavoidably delayed beyond the proper period of publication."

THE SCOTTISH PREFIX —Ben signifies a hill or mountain. Ben Lomond signifies a bare, green hill According to others it is a contraction for Ben-loch lomin,—*i. e.*, the hill of the lake full of islands Benmore is the great or big mountain, Ben Nevis, the snowy mountain, Ben Venue, the small mountain, Beinderg, the red mountain, Benclevghs, the rocky mountain.

A DISCOURSE ON DIRT —Old Dr Cooper, of South Carolina, used to say to his students, " Don't be afraid of a little dirt, young gentlemen What is dirt ? Why, nothing at all offensive, when chemically viewed Rub a little alkali upon that dirty grease-spot on your coat, and it undergoes a chemical change, and becomes soap Now rub it with a little water, and it disappears; it is neither grease, soap, water, nor dirt That is not a very odorous pile of dirt you observe there Well, scatter a little gypsum over it, and it is no onger dirty Everything you call dirt is worthy your notice as students of chemistry. Analyse it ! analyse it ! It will all separate into very clean elements Dirt makes corn , corn makes bread and meat, and bread and meat make the young ladies you kiss. So, after all, you kiss dirt, particularly if their skin be whitened with chalk or Fuller's earth There is no telling, young gentlemen, what is dirt, though I may say that rubbing such stuff upon the beautiful skin of a young lady is a dirty practice. Pearl powder, I think, is made of bismuth—nothing but dirt."

DEGENERACY OF " THE MEN "—Mrs. Partington says that when she was a gal she *used to go* to parties and *always* had a beau to extort her home. But now, she says, the gals undergo all such declivities, the task of extorting them home revolves on their own selves The old lady drew down her specs, and thanked her stars that she had lived in other days, when men were more palpable in depreciating the worth of the female sex.

LIFE WITHOUT LOVE.—We sometimes meet with men who seem to think that any indulgence in an affectionate feeling is a weakness. They will return from a journey, and greet their families with a distant dignity, and move among their children with the cold and lofty splendour of an iceberg surrounded by its broken fragments There is hardly a more unnatural sight on earth than one of those families without a heart. A father had better extinguish a boy's eyes than take away his heart. Who that has experienced the joys of friendship, and values sympathy and affection, would not rather lose all that is beautiful in nature's scenery than be robbed of the hidden treasures of his heart ? Cherish, then, your heart's best affections.

CONSCIENCE.—An eminent and witty prelate was once asked if he did not think that such a one followed his conscience. " Yes," said his grace, " I think he follows it as a man does a horse in a gig; he drives

ANSWERS TO CORRESPONDENTS

T. A (Lincoln).—The " seven sages of Greece were Thales, Solon, Bias, Cleobulus, Chilo Pittacus, and Periander. They were all contemporaries, and they flourished in the sixth century before the Christian era. The great object of their studies was human nature, duties and its principles of action ; and to benefit mankind seems to have been their greatest aim Their " sayings" consist of pithy aphorisms.

J. P.—The weekly newspaper, *The Freeholder*, will, most probably, furnish you with information you require

TIRO.—You do well to " write down thoughts which arise in your mind on any passing events." A determination to persevere in this practice will almost *make* you think, spell yourself, and will, in connexion with a careful reading of the best authors, greatly improve our style. We do not, however, recommend *'style"* as a model of excellence as to style."

P. CARTER.—*Anthracite* is a black mineral substance It is not exactly coal, though it is used as fuel. It is the same substance as that which you call " *glance coal*" It is a mine [illegible]ly combustible, but without flame [illegible]about 96 per cent of pure carbon It has been strongly recommended as steam engine fuel; and iron, smelted with anthracite is said to be superior to other kinds of iron in *strength*. We question, however, whether it would suit your purpose, as iron so made is less *elastic* than that smelted with other kinds of coal

J. G.—We are not of opinion that any property possessed by *your wife*, in her own exclusive right can entitle *you* to claim a vote for the county. If she has sufficient regard for you to enable you, out of her property, to become a member of " *The Freehold Land Society*," by the process of time, be entitled to a vote on your own account

AN INQUIRER.—We confess we have sufficient faith in " mesmerism" to recommend you to study it.

R. R.—By " *Raffaelle's Cartoons*" we understand the seven cartoons by that renowned painter which are exhibited in one of the galleries at Hampton Court, the subjects of which are, " Paul preaching at Athens," " The Death of Ananias," " Elymas the Sorcerer struck blind," " Christ delivering the keys to Peter," " Sacrificing to Paul at Lystra," " The Apostles heal the sick," " The miraculous draught of Fishes" Engravings from these have frequently been published in this country, as well as on the continent. Raffaelle's cartoons were five in number, but most of them are lost or destroyed. The finest set of English engravings from the Cartoons at Hampton Court are those by the Holloway family, they were published at a very high price, selling at £5 or £6 the set [illegible] studio.

SOLITARY.—The subjects of which you speak and to which you say you expected to have four volumes devoted in " John Cassell's Weekly will be taken up in detail in his new publication " The Popular Educator."

B. B. (Banbury).—" Geography" will be the subject of many lessons in " The Popular Educator " The first lesson will have been published by the time this meets your eye. You can now obtain the knowledge you desire by consulting very large map of the world, the expense of which is considerable; but several small maps, including that of the two hemispheres, will be found in " The Educator."

HIBERNIAN.—As Iowa became a member of the United States so recently as 1846, we cannot hardly venture to pronounce upon its suitableness as a state for the development of industrious habits. Sort.

TOM THUMB, " aged eighteen, and only about [illegible]ve feet high," wishes to know how he can improve his growth," and also " the exact height of Lord John Russell." Will any of our correspondents relieve " Tom Thumb's anxiety ?"

A. E.—No patent-rights will interfere with your experiments in electro-metallurgy, so long as you do not attempt to *sell* their results.

THREE READERS should buy the " Handbook for Emigrants," published by John Cassell, price 6d.

Communications to be addressed to the Editor at the Office, 335, Strand,

WORKING MAN'S FRIEND

AND FAMILY INSTRUCTOR.

NEW SERIES.—VOL. II., No. 35.] SATURDAY, MAY 29, 1852. [PRICE ONE PENNY.

THE HOLY LAND.

JERUSALEM AND ITS ENVIRONS.

If the traveller mounts the ruined minaret attached to the deserted mosque on Mount Olivet, he will enjoy one of the finest views of the Holy City and of its vicinity which can anywhere be obtained. Immediately below, even to the opposite brink of the Valley Kedron, Jerusalem lies spread out before him. The strong outlines of the Castle of David are seen on the western horizon. The cupolas of the convents of the church of the Holy Sepulchre, the slender minarets on the north east hill of the city, one after another, stand out to view in the maze of the many roofs of houses, some with low

THE CHURCH OF THE HOLY SEPULCHRE, JERUSALEM.

vaults, some flat, and surrounded by distinct, perforated walls, which again he pursues, until he casts a calm look into the great court of the Haram, inaccessible to him, and contemplates the beauty of the mosques, of the octagonal Sakrah, covered with the most beautiful cupola imaginable, and of the Aksa,—reminding him of the Basilica form of the Christian churches,—surrounded in solemn silence, and almost melancholy, by the lively verdure and flourishing trees, such scarcities in these parts. Turning the eye towards the south, a lofty range of the mountains of Judah limits the horizon in a wide sweep, commencing at the mountains of Tekoa, and running westward. The Frank Mountain (Jebel Furdeis), and the environs of Bethlehem, are also visible. Nearer, and in the same direction, lies a ridge, whereupon stands the Greek monastery of Mar Elias; on this side lies the plain, supposed to be the plain of "Rephaim," contracting itself towards the south-west, into the Rose Valley (Wady-el-Ward), which conveys to the environs of Jerusalem, from the sea, damp fogs or cooling sea-breezes, according to the season. Towards the west lies the nearest parallel slope of the mountain ridge, which bears the Holy City itself, and over which lies the Jaffa road. Further to the north, the height of Neby Samwil rises up steeply with its mosque, from whence he can see the Mediterranean; further in the background the mountains of Samaria; and lastly, towards the east, there is the valley of the Jordan beneath, where a green streak on a whitish ground marks the course of the river towards the Dead Sea, into the mirror of which he here and there may look, between the [illegible] hills on this side, and see how it reflects the ro[illegible] beyond. And if he follow the eastern boundary of

of the Jordan from north to south, there is a continuous chain of mountains, as far as the steep cliffs of the Dead Sea, above which rises, deeper in the country, Jebel Shihân, with its compressed and gently-rising summit, which is in the winter-time frequently covered with snow; while, close to the sea, the valley-clefts of the Zerka river and the Arnon (Wady Mojeb) are plainly to be distinguished, and during clear weather the old fortress, Kerak, also appears like a rock-nest. e the sea has long since disappeared from his eyes, which, a complete circle, again rest on the place whence he set out.

David went up by the ascent of Mount Olivet, and wept as he went up, and had his head covered, and he went barefoot; and all the people that was with him covered every man his head, and they went up, weeping as they went up." In the lapse of ages this same mount was trodden by One who was David's Lord as well as David's Son. In the days of his flesh, he ofttimes spent hours in the shady groves of Olivet, and when his ministry was drawing to a close he was wont to leave the city, at the approach of night, and to resort to the Mount of Olives to pray and meditate against the time of his agony and death. It was on his last visit to the Holy City that, as he drew nigh and had passed through Bethphage and Bethany, that he sent two of his disciples for the ass and the colt, in order that he might make his entry into the city of his own, though his own received him not. They spread their garments upon the animal; they placed the Redeemer thereupon, and as they went, they acknowledged him as their king; "a very great multitude spread their garments in the way, others cut down branches from the trees, and strewed them in the way, and the multitudes that went before and that followed cried, saying, Hosanna to the Son of David; blessed is he that cometh in the name of the Lord; blessed be the kingdom of our father David, that cometh in the name of the Lord; Hosanna in the highest; peace in heaven, and glory in the highest!" Pharisaic pride and ignorance asked for a reproof on these rejoicing thousands; but "he answered, and said unto them, I tell you that if these should hold their peace the stones would immediately cry out." From this point, as he was now descending the hill-side, he beheld the city, the glorious city, as she lay spread out in her magnificence and strength before him, and from those sacred eyes flowed tears of infinite love and compassion. He, who knew the end from the beginning—he who knew the emptiness and nothingness of all human power, might, and splendour—he wept over Jerusalem, and exclaimed, from the depths of his mercy and goodness, "If thou hadst known, even thou, at least in this thy day, the things which belong unto thy peace!—but now they are hid from thine eyes. For the days shall come upon thee, that thine enemies shall cast a trench about thee, and compass the round, and keep thee in on every side, and shall lay thee even with the ground, and thy children within thee, and they shall not leave in thee one stone upon another, because thou knewest not the time of thy visitation."* Ah, thou ruined and degraded city, thy house is left unto thee desolate; Zion is ploughed as a field; Jerusalem has become heaps, and the mountain of the house as the high places of the forest.†

may not now stop to examine of other days, said to be the tomb of Absalom, the tomb of Jehoshaphat, the cave of St. James, &c.; neither can we linger here in the valley of Jehoshaphat, beautiful as it is, with its fig, olive, and pomegranate trees, and its gardens of melons and cucumbers; and full of solemn interest, as it must always be in connexion with the glowing language of the prophet Joel (iii. 1, &c.). Ascending, slowly and thoughtfully, the steep and stony path to St. Stephen's gate, as the visitor traverses the lonely streets once more, he is more than ever struck with their deserted appearance, and with the sad and mournful condition of the Holy City: do not the words of lamentation and sorrow seem, as it were to force themselves on the mind; and can he refrain from uttering, to himself, at least, the language of that holy man whose eyes ran down, "with rivers of waters for the destruction of the daughter of his people?"

> "How doth the city sit solitary, that was full of people!
> How is she become a widow! she that was great among the nations
> And princess among the provinces, how is she become tributary!
> * * * * * * * * *
> All that pass by clap their hands at thee;
> They hiss and wag their head at the daughter of Jerusalem, saying,
> 'Is this the city that men call the perfection of beauty, the joy of the whole earth?'"*

It will, doubtless, gratify the reader to look at the exterior of the Holy City. Let us then pass out of the Damascus-gate, and turning to the left, proceed to make the entire circuit of its walls. Though there are hills close by, they are not so high or commanding as in other parts, and that towards the north, is quite a broad, cultivated plain or valley, which it appears Agrippa intended to include in the city, when he projected enlarging its limits on the north, and fortifying it in such wise as would have rendered it impregnable. As we advance, it is worth while to observe that the present walls are built, to some extent, upon the solid rock, which rises here and there considerably above the surface, and that the rocks have been scarped, and the fosse, or regularly-constructed ditch, for the most part wholly neglected. The walls, it has been said would prove of little service against an invading army well supplied with artillery,† but they are stronger than they seem. The side on which we now are has always been the most vulnerable, and from the time of the Romans downward, Jerusalem has been attacked and taken from the northerly approach. After a little while we come to the northwestern angle of the wall, which appears to project a considerable distance, as if for the purpose of including some spot useful in a military point of view. Following the course of the wall, we soon after reach the Bethlehem or Jaffa gate, and have in full view the large, massive fortress or citadel, which, doubtless, properly manned, would be a place of very great strength. The foundations seem to be of very early date, and at one corner is the square, solidly built tower, which Dr. Robinson supposes to be the tower of Hippicus. On our right, you see the valley of Gihon, as it has been termed, and not far off the remarkable excavation, marked on the maps as the lower pool of Gihon; it is now quite dry and useless, but in the earlier days of Jerusalem's prosperity, this one, and the one farther up the valley, must have been important to the comfort and refreshment of the city. The view here is like what may be seen, alas, nearly everywhere in the neighbourhood of Jerusalem, producing upon the mind a deep feeling of sadness and sorrow, for the degraded and unhappy condition of the city of David. The soil appears barren and unfruitful; here and there are a few trees and some terraced spots under cultivation; but mostly all is stony, dry, and yielding little or no increase. In a few minutes we come to the corner of the wall which turns towards the east, crossing the crown of Mount Zion. Here in this vicinity are the cemeteries of the Christians in Jerusalem, as well as that not long ago purchased by the American mission, as the resting-place of their dead. From this point we will diverge from the wall, and include in our walk the valley of Hinnom, and some points of interest near at hand.

You will notice, as we proceed, how rugged and steep are the southerly sides and slopes of Mount Zion; and when, after a while, we find ourselves in the gorge of the hills, the Hill of Evil Counsel on the one hand, and Zion on the other, with the lovely vale of Hinnom stretching out before us, we cannot but give ourselves to the recollections of bygone days, and the solemn and chastening reflections which these localities must ever produce. The idolatrous monarchs of Judah here dishonoured and despised the Lord in worshipping stocks and stones, and here caused his fierce anger to burn against the wickedness of his people. Ahaz "made molten images for Baalim: moreover he burnt incense in the valley of the son of

Luke xix. 29, 35—44; Matt. xxi. 8, 9; Mark xi. 8, 10.
† Micah iii. 12.

* Lam. i. 1; ii. 15.

† Mr. Williams quotes the opinion of Lieutenant-Colonel Aldrecn of the Corps of Royal Engineers. Speaking of the Tower of David, he says, "It would require heavy artillery to breach it. The walls too of the city are sufficiently strong to require something more than field artillery to effect a breach in them; whilst their position, surrounded on every side by mountains, and difficult of approach for heavy artillery, gives to the fortifications which surround the Holy City an importance which their first appearance would not seem to justify."—Holy City.

tion
children of
Hezekiah, did evil in the sight of
his children to pass through the fire in the valley of the son o
Hinnom;* but his grandson, the noble young Josiah, walked
in all the way of David his father, and turned not aside to the
right hand or to the left; "and he defiled Topheth, which i
in the valley of the children of Hinnom; that no man might
make his son or his daughter to pass through the fire to Mo
loch." He made it a receptacle for the burnt carcasses an
bones, and the filth and refuse of the city, keeping fires ther
continually, in order to consume what was thrown into it,
and to render it ever after odious in the eyes of the idolatrously
inclined people. "Hence," as says the learned Joseph Mede,
"this place being so many ways execrable, it came to be trans-
lated to signify the place of the damned, as the most accursed,
execrable, and abominable of all places." So true
Milton's words:—

"First, Moloch, horrid king, besmear'd with blood
Of human sacrifice, and parents' tears,
Though, for the noise of drums and timbrels loud,
Their children's cries unheard, that pass'd through fire
To his grim idol. Him the Ammonite
Worshipped in Rabba and her watery plain,
In Argob and in Basan, to the stream
Of utmost Arnon. Nor content with such
Audacious neighbourhood, the wisest heart
Of Solomon he led by fraud to build
His temple right against the temple of God,
On that opprobrious hill; and made his grove
The pleasant valley of Hinnom, Tophet thence
And black Gehenna call'd, the type of hell."

"There is something," says Mr. Bartlett, "in the scenery of this valley and the hill above, its tombs hewn in the rock, long since tenantless; the gray gloom of its old fig and olive trees, starting from the fissures of the crags; the overhanging wall of Zion, desolate almost as in the time of her captivity, that forcibly recalls the wild and mournful grandeur of the prophetic writings. Within it, too, is the traditionary 'Aceldama,' or Field of Blood, of the traitor Judas; a small plot of ground, overhung with one precipice, and looking down another into the glen below, on which is a deep charnel-house, into which it was formerly the custom to throw the bodies of the dead, as the earth was supposed to have the power of rapidly consuming them. This place was selected as the burial-place for pilgrims who died at Jerusalem in the middle ages. Such are the scenes that have passed in Hinnom; it is like the scroll of the prophet, 'written within and without with mourning, and lamentation, and woe.'"*

At this time we will not dwell upon the more minute points in the prospect before us; as a whole, this deep valley has an air of beauty unsurpassed by aught in the vicinity of Jerusalem; and the terraced sides of the mount, the gardens of olive, fig, and other trees, the verdant plots of grain and grass, the few features of life and activity in the rustic cultivators of the soil, and other circumstances, give to it attractions of no ordinary kind; but it requires more space than we can now devote to it, to do it justice. We must hasten on: passing by the Fountain of Nehemiah, or well of Job (Joab), which is probably identical with En-Rogel, we may spend a little while in gazing upon the Pool of Siloam, where are "the waters of Shiloah that go softly."† It is picturesquely situate on the steep of Mount Zion, with the lofty hill rising up grandly above it, to a great height. We here turn to the northward again. On our right, perched on the shelving cliffs which overhang the valley of Jehoshaphat, is the petty village of Selwan, or Siloam, with its scanty population, and its dwellings in the excavated rock; and some distance up the valley, pursuing the dry bed of the Kedron, we come to the Fountain of the Virgin, which, it was ascertained by Dr. Robinson, is connected by means of a subterranean channel cut in a serpentine course (1,750 feet long), with the Pool of Siloam. This fountain is well worth examination, and deeply interests the visitor who descends a flight of well-worn steps, cut through the rock, and very irregular, into a chamber, or cave in the rock, roughly hewn, and well (though not steadily) supplied with water. Mr. Williams informs us that there are twenty-six steps, making the depth about twenty-five feet, for the steps are deep. Mounting the hillside once more, by a rugged and toilsome path, we follow again the course of the wall on the side of the Haram: all around are the tombs and graves of the Mohammedan dead. On our left is the long line of lofty wall, looking down from this side, into the great depth of which Josephus speaks, in giving an account of the temple edifice. We pass the Golden Gate, now closed, and cannot but admire the remains, even yet visible, of this noble city entrance. We see stuck out of the top of the wall a part of a round stone pillar, on which, says the story, Mohammed is to sit when the nations are gathered together for judgment, in the valley of Jehoshaphat. We soon reach St. Stephen's gate, and after a while pass entirely round the north-easterly corner of the wall, arriving in due time at the Damascus gate, whence we set out. The whole circuit of the modern walls is 12,978 feet, or nearly two miles and a half. Suliman I., the son of Selim I., erected the walls nearly as they now are, A.H. 948 (= A.D. 1542).

* "Wilks about Jerusalem," p. 62. † 1s. viii. 6.

THE WORKING MAN'S JOY AT THE APPEARANCE OF SUMMER.

LIKE a gorgeous monarch heralded forth,
By wing'd musicians, loyal, dutiful,
Or like a sunny creature full of mirth,
Thou comest, blithe Summer, crown'd and beautiful.
I feel thy breath upon my cheek and brow,
I hear thy glad voice sounding o'er the lea,
And my fond heart is overflowing now,
Thou comest so fair, so musical, so free.
I'm glad ambition cannot fence the sun,
Nor snatch the seasons from my ear and eye;
And when rejoicing comes the poet one,
Yon rich lord feels no loftier than I
Why let them claim their acres, I possess
These tones and breezes, and this landscape view;
I feel the power of Nature's loveliness,
Perhaps, more than the land-possessors do.
Quite true, I labour, this is mean, they say,
Greatness must only fight or legislate;
But let the tollers cast their tools away,
And what becomes of England's boasted state?
Enough! I have my golden hours of rest,
A heart for duty, hands for labour still;
The truly brave are they who work the best,
And thus perform the great Creator's will.
Then welcome, Summer, to our isle again!
O welcome, song-bird, breeze, and flower, and bee;
Ye come with lofty teachings unto men,
And songs of labour, love, and liberty!

J. B., Burnley.

OMNIBUSES IN AMERICA.—The American omnibuses (says Mr. Watkins, in his "Trip to the United States") cannot afford the surplus labour of a conductor. The driver has entire charge of the machine; he drives, opens and shuts, or "fixes" the door; takes the money; exhorts the passengers to be "smart," all by himself, yet he never quits his box. He keeps command of the door, by having beside him the end of a leather strap, which is fastened to a row of rings to a [illegible] he slackens; then he desires to shut it, he tightens the strap, and thus no one can give him leg-bail, and be off without paying the fare. The money is paid to him, and directions to stop given through a hole in the roof just below his seat; and it is marvellous with what celerity and *sang froid* he takes your money, and, perhaps, gives you change, with one hand, while driving his team with the other through a crowded neighbourhood. He seems, too, to possess the power of speaking to his horse and his passengers at the same time, and sometimes you doubt whether he is not practising a kind of ventriloquism, for you hear him call out the name of your street, invite some new customer to enter his vehicle, and ironically inform his rival drivers that he "just does guess they are particular smart" for running across his path or stopping in his way, almost in the same breath.

JEAN PAUL RICHTER.

That age which gave to Germany Lessing, Wieland, Goethe, Schiller, and Herder, also produced a man who, although not destined to share the popularity of these great writers, will yet occupy an eminent place as a profound thinker. This man is Richter. In him we find represented, so to speak, the German character, full of mysterious fancies and profound conceptions, and striking contrasts of light and shade. To read and understand his works is no easy matter, and requires no small amount of attention and serious study. His writings overflow with the spirit of German life, of the boundless ——— and solitary mountains, of sunny meadows and dark, silent streams. His writings are full of a spirit peculiar to himself—a strong and powerful nature, which throws aside the common artificial ornaments and the embellishments of conventionality. Jean Paul has a deep feeling for capricious fancies and daring touches, and few who have studied his writings will rise from them with any feelings but of pleasure and admiration. Richter was born at Wiensiedel in 1763. His father, a poor clergyman, died early, and his mother strained every energy to place her son in the Leipzig University. Having finished his studies, he returned home, and there, in a single room, while his mother sat at her spinning-wheel, or busied herself with her household duties, the future author of "Titan" sat at his desk, studied the works of antiquity, and collected, with indefatigable ardour, that comprehensive knowledge which he displays in his writings. To assist his mother in providing for their domestic wants, he gave lessons to several neighbours' children in his tender and paternal manner. This task, although severe, brought in but a small remuneration. Money was scarce in their household; and if by accident he was able to put aside some small amount to buy an Easter present for his mother, it was a time of unusual happiness to him.

Jean Paul Fr. Richter

As a relief from his scholastic duties and his unwearied labour, Jean Paul was accustomed to take long walks into the country, accompanied only by his dog. He observed and studied everything around him. Nature was a book which he was never wearied of perusing; she inspired him with a profound veneration. "Do you," he asks of himself, in one of his works, "enter this vast temple with a pure mind? Do you bring with you any evil passions into this garden, where the flowers blossom and the birds sing—any hatred into this glorious nature? Do you possess the calmness of the brook, where the works of the Creator are reflected as in a mirror? Ah! that my heart were as pure, as peaceful, as nature when just created by the hand of God!"

During the summer, Jean Paul often carried his books and his writings to a neighbouring hill, and laboured, surrounded by that nature whose images reflected themselves so vividly upon his mind—whose harmonies are so clearly echoed by his words. He contemplated nature as a poet, and described it as a philosopher. A blade of glass or the wing of a butterfly sufficed to awaken in him a spirit of scientific analysis, but at the same time a vein of gentle reveries. In studying nature with ——— he also studied the most hidden recesses of his own heart. He kept an exact journal of his feelings, of the faults he discovered in himself, and wished to correct, and of the virtues he desired to acquire. In this journal we find the following:—"This morning I took out with me a writing-case, and wrote as I walked. I am delighted at having conquered two of my failings—my disposition to lose my temper in conversation, and to lose my cheerfulness when I have been plagued by dust or gnats. Nothing makes me more indifferent to the small annoyances of life than the consciousness of a moral amelioration."

Another time he says, "I picked up a withered rose-leaf, which the children were treading underfoot, on the floor of the church, and on this soiled and dusty leaf my imagination built up a world rejoicing in all the charms of summer. I thought of the day when some child held this flower in its hand, and watched the blue sky and the rolling clouds through the windows of the church, where the cold dome of the temple was inundated with light—where the shadows, here and there obscuring the arches, rivalled those which the fleeting clouds cast upon the meadows in their course. Father of kindness! thou hast everywhere scattered the germs of happiness—all things are endowed by thee with a glorious perfume!"

Although his existence was passed in almost entire solitude, it was not from sombre misanthropy. On the contrary, his heart was filled with charity and universal benevolence. He has been known to shed tears at the sight of a cripple, or a child in distress. Even the care of animals occupied part of his spare time. He usually had several favourite animals in his room; he kept canaries, which were accustomed to descend by a ladder, and hop among his papers.

In 1798 he married a young lady in Berlin, Camille Meyer. This marriage was full of happiness to him, and he mentions it several times with exquisite taste. He had two daughters and a son. At this time he had become generally known by several works, among which are "Levana, or Lessons on Education," and the "Campaner Thal." By his writings, as well as by his marriage, his worldly affairs were much benefited; but he was still the same simple and unassuming being, devoted to study and enjoying every innocent pleasure and recreation of life. Once only did he visit Berlin and Weimar, to see those men whose writings had so often roused his enthusiasm; but soon returned home, more full than ever of his poetic dreams.

We are indebted to his daughter for many pleasant details of his calm and peaceful domestic life. "In the morning he always came to our mother's room to wish us good morning. His dog gambolled around him, and his children clung to him, and when he retired tried to put their little feet into his slippers to retain him, or hanging to the skirts of his coat till he reached the door of his study, where only his dog had the privilege of following him. Occasionally we invaded the upper story, where he worked; we crept along the passage on our hands and feet, and knocked at his door till he let us in. Then he would take an old trumpet and fife from a box, on which we made a horrible noise while he continued his writing.

"In the evening he told us stories, or spoke to us of God, of other worlds, of our grandfather, and of many other subjects. When he commenced his stories we all endeavoured to sit close to him. As his table, covered with papers, prevented our approaching him in front, we clambered over a large box to

the back of his couch, where he lay full length, with his dog beside him, and when all were seated he began his stories.

"At meals he sat down to table merrily and listened attentively to all we had to tell him; sometimes he would arrange one of our stories in such a manner that the little narrator would be quite surprised at the effect. He never gave us direct lessons, but, notwithstanding, he was constantly instructing us."

Towards the end of his life, Jean Paul was afflicted with a sad infirmity; he became blind, but supported this misfortune with a pious resignation; his gaiety even did not appear to be affected. The beauties of nature were treasured in his mind, and he regarded them through the eyes of memory. He still studied by having his favourite authors read aloud, and thought with greater calmness than ever.

On the 14th of November, 1820, he was confined to his bed. His wife brought him a garland of flowers, which had been sent to him. He passed his fingers over these flowers, and they seemed to revive his faculties. "Ah! my beautiful flowers," he said, "my dear flowers!" Then he fell into a tranquil sleep. His wife and friends regarded him silently. His countenance had a calm expression, his brow seemed unclouded, but his wife's tears fell on his face without arousing him. Gradually his respiration became less regular; a slight spasm passed over his features, and the physician said, "He is dead." Thus passed from this world a man who was able to accord his actions to his thoughts; his life and the works he has left behind are abundant proof.

MODERN PROPHETS.

MANY were the echoes caught of old from the far To Come; oracles spoke to the Greeks from the silence of rock and fountain; stars, to the Chaldeans, gaze, cast their light upon futurity; and the Scythian shepherd saw the shadows of coming years in the clouds that flitted across the sky of his desert, but the old prophet voices, haunting grot and grove of the early world, are gone. The earth has outlived the mystery as well as the faith of her childhood. We have left the Grecian Pythoness, the Roman Sibyl, and the Crusader's astrologer, far behind among the debris of the past. The German prophets, the French visionists, and all of the Solomon Eagle school, rest with the swords of the Thirty Years' War, the shades of the Huguenots, and the ashes of the Covenant, save when some rag of their time-tattered mantle descends on the shoulders of a Mormon among the slave-markets that illustrate "American Freedom." The future is now indeed our Isis with the still unlifted veil. Yet, even in this age of steam and commerce—the two great allied sovereigns that share our world between them; amid the flutter of railway scrip, the flourish of pens, both steel and goosequill; the rattle of types, and the buzz of growing factories—we have our prophets yet; ay, reader, and prophetesses too, who deliver their oracles with a good will that rarely waits to be consulted. It may be the very liberality of their wisdom at times makes it undervalued, for even diamonds, when given away, are despised, as the lately discovered mines of Bahia are expected to prove; but certain it is, that most of our modern prophets share the fate of Cassandra, for they find few believers, though marvellously strong in the faith of their own revealings.

But let us descend to particular description for the benefit of those who may not have met with a specimen of the inspired.

They are found in all ranks of society, from the palace to the hovel, but most frequently in that widely-diffused, though rather indefinite, order known as "The Middle Class." The external appearance of their fleshly tabernacles, however, differs considerably from those of the far-seeing souls of elder time, whose wasted frames, haggard faces, and dishevelled hair, proclaimed how fearful a thing it was to draw the curtains of fate. But the Jonahs that warn our modern Ninevehs are, on the contrary, portly, well-dressed, "well-to-do-in-the-world-looking" individuals, rather elderly,—for we never knew either man or woman take to prophesying earlier than thirty; and, from our own observation and experience, we believe that inspiration seldom becomes habitual till after the fortieth year.

They are, moreover, generally married. Bachelors rarely utter predictions, except they happen to own a considerable sum in the funds, and a proportionate number of nephews and nieces in the neighbourhood; and old maids never, except in extreme cases, or when "coming scandals cast their tattle before."

But whether in single or double blessedness, it is a fact not to be disputed, that the prophets and prophetesses of our age are invariably in possession of more of the current coin of the realm than the whole of their kindred and acquaintances, to whom they are usually most bounteous of advice, and ready on all occasions—particularly when the least dissent from their opinions is expressed—to inform them what shall befall them in their latter days.

The most notable prophet of our acquaintance—and it has comprehended some originals, including ourselves (peace to their shades who have gone before us, for we begin to be alone), but the most remarkable in the prophesying line was Samson Heavyside. Samson was, or rather had been, the principal shopkeeper of Chatterford, a small country town known to our memory as home, in the years when home was precious as a place of friends and holidays; that stood out in brilliant contrast with the cold and tiresome school. Well, we remember it yet; its broad great streets, where a row would have made an era, and a crowd was never known; its old-fashioned brick houses with their narrow windows, and the girls that looked out at them, are all changed since, except in our dreams; its small sober-looking shops, that seemed to our childhood's fancy rich with a wealth we never found in all the world of men; but above all we remember—Samson Heavyside. Politeness would have termed him a rather stout gentleman, for his circumference considerably exceeded his altitude, which was at the best a something below the middle stature; in youth he had been handsome—at least Mrs. Heavyside said so, and we suppose she ought to know; but the period had passed before our recollection, and to us he appeared with a countenance round and rosy as the full rising moon,—poets, forgive the simile; a globular head bald as that of the seer of old, for Time himself had shaven it; and a pair of small blue eyes filled with an unvarying expression of self-satisfaction, for he had grown rich, and was listened to in Chatterford; and he also possessed such a peculiar knack of closing the said windows of his soul against our external world and all its vanities on occasions of high and solemn prediction, that this act served as a signal to his acquaintances, informing them that prophecy on a great scale was about to commence.

Samson had been in business almost from his boyhood, and seemed one of those destined by nature to "have and to hold," as the church service hath it; with knowledge just sufficient to carry on trade in the country; habits that were constitutionally regular and steady; and a mind that never strayed beyond the same narrow circle of commonplace ideas. He had scraped and plodded on in the village where he was born, and though gifted with little energy and less enterprise, had contrived to become the Rothschild of Chatterford, while scores of his contemporaries, with better abilities and more prosperous beginnings, were still struggling amid the thousand difficulties which beset fathers of large and respectable families.

Fortune had charmed Samson from all such drains on the purse, for he had no family except what was constituted by himself and Mrs. Heavyside—a thrifty but simple-minded dame, remarkable only for her activity in housekeeping, and an immovable trust in the prophetic powers of her husband. They had married prudently, though somewhat late in life, yet with a due consideration of each other's worldly possessions; and after saving and managing together for more than twenty years, during which Samson's ability and readiness for prediction increased with every additional hundred that swelled his credit at the bank, Mr. Heavyside at length made up his mind to retire from business to a large house which he had built—to use his own words—"on purpose for himself," leaving the now empty shop and long brick edifice which he had formerly occupied to a widowed sister with two sons and as many daughters, who managed to keep up a decent appear-

ance by their united industry, and also afforded matter for their uncle's foretelling wisdom when other subjects were scarce in Chatterford. Often were their fortunes declared, and under various aspects, for Samson had now nothing to do but prophesy.

I know not whether it was the weight of unemployed time or the silence of his home, unbroken by the music of young voices, that made the old man's stay within its walls so brief, for his oracles were generally delivered where most of his hours were spent, wind and weather permitting,—at the open door.

Worthy old Samson Heavyside; he rises still to our imagination most prominent of the things that were in Chatterford. We see him in his old accustomed station one sunny morning, clad, or rather rolled up, in black broadcloth—for he was one of those individuals whose garments seem intended as swaddling bands for them—casting ominous and wrathful glances over the way at the new and handsome window with which his nephews had commenced shopkeeping in the scene of his early sales; and still less gentle looks at the other extremity of the house, where an advertisement board proclaimed to all concerned the long list of accomplishments taught in the seminary "for young ladies" just opened by the widow's two daughters. "A great change that, Mr. Heavyside," said the apothecary next door, as he stepped out with a warning word to the young apprentice. "Now, that's what I call improvement."

Samson answered only by an awful shake of the head, and then, closing his eyes in due form, he proceeded to business.

"Yes, Dr. Smith, no doubt you would call it improvement; but I can tell you that family will be ruined, totally ruined and undone: within the next twelve months a dark deal shutter will cover their nice-trimmed window, and they'll all be in the debtors' prison or somewhere worse, and that's just their deserving. Couldn't them there foolish young men keep the shop as I had it before them? They'll never make as much money, I fancy! And as for the girls, what call had they for a school? Couldn't they wash, and sew, and darn, as their mother did? though they mightn't earn much, it would keep them out of harm's way. There's no standing the pride of young people, doctor; but mind, I tell you it will get a downcome!" Such were Samson's responses; and a year passed over the earth with all its chance and change, and left some traces of its footsteps even on that small community.

Samson stood again at his door on another sweet sunny morning, such as our English summer sheds on the quiet villages. But Chatterford was not then quiet; the bells of the old church were ringing a wild and merry peal, and half the town were moving to the sound with a flutter of white ribbons and muslin, for the widow's eldest daughter was to be married to a young artist, the son of a neighbour, and born to prospects even less brilliant than her own. There had been an early promise between them, which he returned to claim after years of toil in a distant city, where he had won less wealth than reputation, and that day was Mary's wedding. Samson stood forth, but not to join the bridal procession, for he remembered that young Burnell's father made shoes while he sold sugar; therefore he voted the match low, and prophesied against it accordingly.

Out stepped Dr. Smith, again to enjoy the usual gossip, and after him out stepped to the door the young apprentice. Readers, we are above concealing the fact, that apprentice was ourselves; but we had not then assumed the plural, for time had not yet given the royalty of the pen, in which we now rejoice, meagre and circumscribed though it be as that of a German margrave, and put to sad shifts at times to maintain its dignity, especially in the "financial department."

But let us not speak of those things, for they, and more than they, were foretold to us a thousand times by the prescience of Samson, though we believed in better; and our first sonnet was already written: it was never printed, except in our memory, and the subject thereof was Mary. The doctor opened the session by observing "That it was a fine day, and a very fine wedding." But Samson's eyes were already closed in prophetic fashion. "Yes, doctor," said he, "simple people may imagine so; but I can tell you it is a most unlucky day for my niece, poor thing; she'll never live happy; and before a twelvemonth they'll both be in the workhouse, depend upon it, doctor. I know what's to happen, and that will be a just dispensation of Providence on her for disgracing all her relations by marrying a shoemaker's son; for they are disgraced, though they don't know it, the creatures; and on him, for looking up to my sister's daughter; but they'll all go to ruin anyway."

The wedding procession had passed, and we might not follow, though our heart went after it; for we felt we were but an apprentice, yet the old grocer's last observation woke the slumbering soul of chivalry within us, as now, in the world's grey and frosty age, it wakes only in the breast of eighteen; and in spite of the power of his bank stock, in spite of the terrors of Doctor Smith, yea, and the fear of our own mother's lecture, we shouted at the top of our voice—and truly that was no small pitch—pointing at the same time to the still well-painted and better filled window over the way. "Ha, old boy, you prophesied as bad about the shop and the school this time last year, and there they are both yet!"

Doctor Smith stood dumb with astonishment, all the old people within hearing ran to the doors, and Samson opened his eyes on us in mingled wrath and amazement; but the seer of Chatterford had an original mode of interpreting his own predictions. "You young saucebox," cried he, in no very gentle tone, advancing, as it with intent to collar, "didn't I say they would all be ruined, except they amended their ways; and so they did, though it *warn't* much; but they'll all be ruined, anyway, and so will you, you young villain;" and his eyes closed, "Doctor Smith, that boy will be hanged yet." And Samson withdrew into the sanctity of his own four walls, giving the door a prophetic bang behind him, where he edified Mrs. Heavyside with many an awful disclosure regarding the futurity of the whole town, and ourselves in particular, till both deplored in concert the foreseen misfortunes, for though Samson rarely prophesied anything but evil, there was no malice in his composition, and the only subject of lamentation he and his helpmate had (by the by, an indispensable article to some people) was found in his own predictions, for they never doubted their fulfilment. We will not linger to relate how Doctor Smith expressed his sense of our merits on the occasion, nor recall the animadversions of our mother, prolonged though they were to a rather late hour that evening; but from that day Samson displayed an unusual interest in our destiny, and his versions concerning it generally vacillated between the gallows and the workhouse.

Years passed away. We had gone forth into the world, and tried our strength amid the strife of men; we had mingled with the crowds of cities; we had learned their lessons; alas! for the knowledge of good and evil is strangely blended; and we had gained some steps, short and slippery though they were, in the highway of fortune; but sufficient to give our words a weight and our opinions an importance unknown to apprentice-doings among the magnates of Chatterford; for we had returned a greater if not a better man; but the tracks of time were deep in that quiet corner: many were altered, and some were missed; for the scythe had been there as well as the sand-glass; but as we sauntered up the street in all our travelled glory to revisit the scene of our early bondage, in the shop of Doctor Smith our ear was caught by a sound of other days:—"Doctor, depend upon it, I know what's to happen; the bush-rangers will rob them, and the kangaroos will eat them, and they'll never get as much as a Christian funeral; but people will go to their own destruction."

And there stood Samson in the old accustomed station, with his eyes fast closed, prophesying to our former instructor against the intended voyage of his young niece and nephew, who were bound for the far Australia. Their mother was dead, and their elder brother had married. Mary and her husband (we have forgiven the fellow) were growing rich and prosperous, and the solitary brother and sister hoped to better their fortune in the southern "Land of Promise."

Samson had an old man's dislike of emigration, and had been more than usually liberal of his predictions, having already foretold shipwreck and misfortunes of every possible shape by land and sea; for it was only the conclusion of the vision that reached our ear. But pleasant letters came back from that wandering pair—letters full of hope and prosperity—and both married well in the distant colony. It was thought that Samson showed something very like disappointment at

the news; but he prophesied on; and as the march of the world's improvement gradually neared the narrow sphere of his observation, matters of more public import [illegible] in his revelations. A library was established in Ch[illegible] and he prophesied against that; people nevertheless read, and the books increased in number. A news-room arose, and Samson foretold its doom. But it prospered, and he was at length caught reading the Queen's speech quietly by the fire. But as the old man's thread of life grew thinner, his predictions took a more alarming turn, and his inherent love of the terrible seemed to strengthen; till at length, on the lighting of Chatterford with gas, he was actually known to run from house to house, warning his neighbours against the catastrophe which must follow, and when no one believed his report, Samson stationed himself as usual at his own door, and made a point of calling in every passer-by to give them private instruction from the depths of his boding vision. We know not what decrees of Fate he made known against the steam-engine and power-looms, some of which were now established in the neighbourhood, but many of the rising generation openly avowed that Samson was insane, and the men of his own age had lost confidence in his foreknowledge, for some of them had grown as rich as himself. But Mrs. Heavyside's faith was still the same, and in her he found a believing listener when all Chatterford failed him.

When we last saw Samson Heavyside he discoursed no longer touching ourselves and the gallows, nay, he seemed to have forgotten or forgiven our early unbelief; age and disease had laid their withering hand upon him, and he could no longer reach the door at which he delighted to prophesy. His trusting partner had gone down to the grave before him, his ear had failed, and his eye grown dim to our earthly sights and sounds; but a word dropped, we know not how, regarding "the railway" then in progress, chanced to reach him, and the slackening chord once more sent forth a prophetic tone. "It will never do," cried he, in a thin voice cracked by age and anger. "It will ruin the world; I know it will, and all connected with it will be ruined; turned to 'stags' every man of them, depend upon it, for I know what's going to happen."

Poor Samson, peace to his prophetic soul! that was the last prediction he ever uttered, and that railway train sweeps past his very grave; but the number of its "stags" we never counted, though it may be that many of the old man's visions were as certain as the dreams of our early hope or those of all modern prophets.

CONVERSION OF THE CRYSTAL PALACE INTO A TOWER, 1,000 FEET HIGH.

It is proposed, as we learn from a contemporary, to build an enormous tower (a sort of antithesis to the tower of ancient Babylon) of the materials of the glass palace, preserving, as much as is consistent with the new design, all the features of that structure, with a view of perpetuating the great event of the year 1851, and forming a depository of every branch of art and manufacture our own kingdom produces, as well as a choice collection of exotics from the four quarters of the globe. The material is all ready at hand, and a site near might easily be found. The building, from the peculiarity of its design, forms its own scaffold, and the ground it would occupy is less than one acre; and with the proposed terrace round the building, altogether under four acres. This economy of ground, when compared with the space the Glass Palace occupies, is an important consideration, in such a place as London, where land is valuable. Before any remarks on the project are offered, it will be as well to give an explanation of the various means proposed to be adopted to render so vast a structure perfectly safe against the strongest hurricanes. In the centre is a large octagon, composed of twenty-four columns, which spring from the foundation, in which they are securely imbedded to the very top of the building. Adjoining is a dodecagon, similarly constructed, forming the second tower in the elevation, and rising to the second gallery of 840 feet. The dodecagon tower also springs from the foundation, and is carried up to an altitude of 660 feet. We then see a square of columns measuring 120 feet on one side. This likewise rises from the foundation to whom the clock is placed, and is surmounted by four turrets, which lend their aid in supporting the building, and screen in some measure from the wind those adventurous visitors who arrive at this [illegible] promenade. Another square of larger dimensions abuts on all these, and rises to a level of 198 feet, upon which four galleries, each 120 feet in length, are to be constructed. Similar small turrets are to be placed at the four corners. In addition to this accumulation of strength in columns and girders, a portion of the south front of the transept is added to each side of the square, forming a cross, not only as an abutment, but with a view of perpetuating the most elegant part of the present building, and handing down to posterity the entrance through which so many thousands passed. The four halls formed by this cross might be reserved for choice plants, &c., with appropriate statuary ornamenting the outside, and relieving the general effect. If we suppose four of the upright columns, with four of the girders attached, and bolted to firmly-fixed cradles in the foundation, it will give a notion of a hollow cube of brick or stone of similar dimensions. Were the building constructed of such cubes, it would be so strong or durable as of the material so opportunely presented. If we imagine a give-and-take line passing through the section from the outer colonnade columns curving up through the towers towards the top of the octagon, a figure similar to the outline of the Eddystone Lighthouse will be presented to the mind. The clock is of proportional size to the tower, being 41 feet in diameter, with figures ten feet long: its elevation about 440 feet above the terrace, and many feet above the cross of St. Paul's; the gallery over it is somewhat less than the Great Pyramid of Egypt; and were St. Paul's Cathedral placed on the top of St. Peter's, there would then be room for the Nelson's Column, which would about reach the Crystal Tower's summit. The little squares in the octagon represent four carriages or ascending rooms, which are to be continually running on, or rather up, a vertical railway to the glazed gallery at the top of the octagon, where the visitors may observe the view around, sheltered from the wind. There is also a platform on the very summit, for the more adventurous. The view from any of the galleries would be magnificent in the extreme. Messrs. Fox and Henderson have expressed their conviction that the project could be carried

MENTAL DIFFERENCES BETWEEN THE SEXES.—The theory of the mental equality of the sexes has not wanted eminent supporters. Plato says there is no natural superiority of man over woman, except in strength. Professor Dugald Stewart is of the same opinion, and thinks that the intellectual and moral differences which we observe are only the result of education. Voltaire thinks that women are on a level with men in every talent but invention. With all due deference to these high authorities, we cannot subscribe to their views. It will not be denied that, be they assignable to education or nature, great differences do exist between the moral and intellectual characteristics of the two sexes. Of these differences, the following appear to us to be the most remarkable.—Women have less of active and more of passive courage than men. They have more excitability of nerve, and with it all those qualities which such excitability tends to produce. They are more enthusiastic—their sympathy is more lively—they have a nicer perception of minute circumstances. Whether, as stated by Professor Stewart, they have greater quickness and facility of association, may, we think, be reasonably doubted. They are certainly not superior to men in those powers of association which produce wit, though they often possess them in an eminent degree. They are inferior in the power of close and logical reasoning. They are less dispassionate—less able to place their feelings in subjection to their judgment, and to bring themselves to a conclusion at variance with their prepossessions. They have less power of combination and of generalisation. They are less capable of steady and concentrated attention; and, though their patience is equal, if not greater, their perseverance is less. Such appear to us to be the principal mental differences between men and women. Some will be disposed to extend the list, and others to abridge it; and there will, perhaps, be scarcely any to whom some instance will not occur of inferiority or superiority at variance with the preceding statement. But it must be remembered that, amidst the infinite diversities of mental phenomena, it is impossible to lay down any rule from which there will not be some exception, and that our judgment must be guided by the majority of cases.

INTERIOR OF A CELL

CLUB LIFE IN LONDON.

One of the phases of London life peculiar to the rich is that of Clubs. The visitor from the country passes through Pall Mall or St. James's-street, and sees on either hand large, handsome, palace-looking buildings, with showy vehicles waiting at their doors, and well-dressed men standing on the marble steps, or looking out from the wide, noble windows on the ground floor. He inquires what dukes, princes, or ambassadors reside in these fine mansions, and is told that they are merely clubs! "Merely clubs!" he thinks to himself; "well, these Londoners must be a very wealthy people,—merely clubs." Perhaps the gentleman from the country has been in the habit of associating the idea of a tavern parlour or a market meeting with the word Club, and is therefore hardly prepared to find the clubs of London quite so well housed. But he should be told that the word has a "west end" signification, when it means a kind of private hotel for gentlemen and a city and "east end" interpretation, in which latter sense it comprehends the convivial meetings of tradesmen and artisans in little taverns in dull back streets, the larger assemblages of workmen who meet once a week or thereabouts in certain favourite resorts, and the numerous useful and praiseworthy institutions, known as Benefit and Burial Clubs, which are spread over the length and breadth of the land.

It is of the clubs at the west end of London, however, that we would say a few words—the rich men's clubs. These consist of associations of gentlemen, who, by paying an annual subscription, varying in amount from five to ten guineas, secure to themselves all the comforts of a private house on the most liberal scale, with the conveniences of a first-rate hotel—and that, too, without any of the disagreeables or any of the responsibilities attendant upon housekeeping. Take the Athenæum Club in Pall Mall for instance—that noble building to the right of the Duke of York's Column, as you enter St. James's Park from Regent-street. This Club—which may be said to take the place of the old Literary Club founded by Dr. Johnson and Sir Joshua Reynolds, in 1764—was instituted in 1823 at the suggestion of the right hon. John Wilson Croker, for "the association of individuals known for their literary or scientific attainments, artists of eminence in any class of the Fine Arts, and noblemen and gentlemen distinguished as liberal patrons of science, literature, and the arts." Associated with the editor of Boswell's Johnson were Sir Thomas Lawrence, Sir Francis Chantrey, Mr. Jekyll, and other gentlemen known for their high literary and artistic attainments; and under such patronage it was no wonder that the club soon came to be considered as one of the best in London; that to be a member of it gave an author or an artist a certain understood status in town society; and that it has gone on prosperously from the day of its foundation. The Athenæum Club consists of twelve hundred regular members, many of whom are peers of the realm and high dignitaries of the church; the entrance fee is twenty-five guineas, with a yearly

lar members voted in by ballot, the committee have the power of electing annually, from the list of candidates for admission, a certain number of gentlemen "who shall have attained to distinguished eminence in science, literature, and the arts, or for important public services." Thus among the members of this noted club, may be found persons in the highest positions in society—noblemen, military and naval officers, ecclesiastics, members of parliament, lawyers, poets, painters, and merchants.

The stranger introduced for the first time to the Athenæum, or any other first-class club-house in London, will be surprised at the beauty of the building, the order and regularity observed by the attendants, and the facility with which everything can be obtained which ministers to the ease and comfort of the members. For six guineas a year the members are enabled to consult a splendid library of their own, to read any (or all, if they choose) of the maps, blue books, magazines, and newspapers of the day; to find themselves liberally supplied with the materials of writing in almost any room in the house; to be waited on by quiet, watchful attendants at any hour of the day or night; to sit in apartments replete with all the comforts of the best private houses, and to walk in and out of a building like a palace, of which every member may consider himself as part proprietor. In fact, a member of this club may individually act the part of "master of the house," without any of the anxiety of one. He can eat and drink of the best at any hour, and pay only for just as much as he consumes; he can command the attendance of first-rate servants, without any of the trouble of managing them, much less of paying them wages; he can go as often as he chooses, and always find things prepared for his reception, and stay away as long as he likes without discovering anything to have gone wrong in his absence; he can do as he pleases, order what he likes, make the Club his London residence; and, in fact, live with a greater degree of liberty and ease than is possible in almost any other house. Club-life in London may be said to combine the best accommodation of first-class hotels, with the attractions and comforts of a domestic establishment.

This, however, is the fair side of the picture. It has, like most other views, its shadows as well as its lights. In many of the London Clubs, gambling and "genteel" profligacy are carried, nay, promoted, to an extent unknown and undreamed of, except by the actual members of such establishments. Billiards,—a harmless kind of game enough of itself,—cards, dice, chess, draughts, backgammon, and betting-books, are all made to contribute to a kind of excitement much to be dreaded by the young and inexperienced; but, on the other hand, it is to be remembered that the most inveterate gamblers at the Clubs are neither very juvenile or very inexperienced in the ways of the town.

A few memoranda of another celebrated club—White's, 37 and 38, St. James's-street—will be sufficient to show this, the darker, side of the picture; always remembering, however, that what is said above can by no means be made to apply to the majority of the London club-houses. White's, one of the oldest and most notorious of the clubs, is situated over against (what was till 1848) Crockford's, in St. James's-street. It was originally founded in 1698, at a house in the same street, and was known as White's Chocolate-house. In 1733 it was destroyed by fire, at which time it was kept by a man called Arthur, from whom it passed (in 1761) to Robert Mackreth, and thence (in 1784) to John Martindale, who (in 1812) sold the property to Mr. Ragget, the father of the present proprietor. White's and Boodle's—28, St. James-street—are proprietary establishments; most of the other clubs are joint-stock concerns, vested in trustees, and managed by committees chosen annually from among the members.

The readers of the "Tatler," Pope's "Dunciad," the "Walpoliana," or any of the like books of the last century, are no doubt familiar with passages in which White's and other gambling-houses are mentioned. The early records of this club, many of which are preserved, give a vivid idea of the state of society among the wealthy in those days. In 1736 there were to be found among its members the polite Chesterfield, the witty Colley Cibber, the Duke of Devonshire, the Earl of Cholmondely, Sir John Cope, the poet Churchill, and Pelham, the prime minister, a man of whom it is said, that he divided his time between "the gamblers at White's and the legislators at the Commons." Walpole tells us that the celebrated Earl of Chesterfield, the man who told his son that "a member of a gaming club should be a cheat, or he would soon be a beggar," lived at White's, "gaming and pronouncing witticisms among the boys of quality." Swift in his "Essay on Modern Education," tells us that "the Earl of Oxford, in the time of his ministry, never passed by White's Chocolate-house (the common rendezvous of infamous sharpers and noble cullies) without bestowing a curse upon that famous academy, as the bane of half the English nobility;"—and Lord Lyttleton, in a letter to Dr. Doddridge (April, 1750), says, "The Dryads of Hagley are pretty secure, but I sometimes tremble to think that the rattling of a dice-box at White's may one day or other (if my son should be a member of that noble academy) shake down all our fine oaks. It is dreadful to see, not only there, but in almost every house in town, what devastations are made by that destructive fury, the spirit of play." In the present day we have, happily, not so much of this fearful evil to contend with among the rich and well-born; but, just as the gambling spirit has departed from the west-end clubs, it appears to have descended with more destructive influence on the middle and lower establishments;

and betting-shops are rife in every street, where the mechanic and apprentice may become initiated into vice "at the low charge of one shilling."

In 1775 the number of members at White's was restricted to 151, and the annual subscription raised to £10 10s.; in 1781 the number was enlarged to 300; in 1797 it was again enlarged to 400; in 1800, to 460; and in 1813 to 500 members; to which number it is now restricted. Some of the rules existing in the beginning of the present century are curious. One of them provided that "Dinner, at ten shillings and sixpence per head (malt liquors, biscuits, oranges, apples, and olives included), should be on the table every day at six o'clock;" another, that "the dice used at hazard should be paid by boxes—that is, every player who holds in three hands, to pay a guinea for dice;" a third, that "no member of the club should hold a faro bank," and a fourth, that any member "who plays billiards after the supper-bell is rung, is to pay his reckoning for that night;" and so on.

In 1736 White's ceased to be an open chocolate-house, where any one might loiter who could pay for what he had; and being then made a private house for the convenience of the most general frequenters, it became, in the course of time, to be a regular club, in the ordinary sense of the phrase. For many years it continued to be considered as essentially a gaming club; and even now a betting-book is placed on the table in the smoking-room for entering bets in, and billiards and card-playing are still practised by the members of this and some few other clubs. With reference to the inveterate spirit of gambling which once prevailed at White's—a spirit which induced its members to make bets on almost any subject—the marriage of a countess, or the death of a prince, before such and such a time; the success of a Cabinet minister, the failure of a private merchant, or, in fact, any slight difference of opinion whatever, various verbal and pictorial witticisms have been perpetrated—the most famous of which is that attributed to Horace Walpole in 1756. Sitting after dinner at Strawberry-hill with George Selwyn and a few chosen friends, it was proposed by the wit to design a coat-of-arms for the noted club. No sooner said than done;—the friends consulted together, and this was the result:—The blazon was vert (for a card-table); three parolis proper on a chevron sable (for a hazard table); ten rouleaus in saltier, between two dice proper, on a canton sable; and a white ball (for election) argent. The supporters were a young and old knave of clubs; the crest an arm out of an earl's coronet, shaking a dice-box; round the arms, by way of order, was a claret-bottle ticket, and the motto was "*Cogit Amor Nummi*"—the love of money compels.

What we have said of these two clubs—the Athenæum and White's—applies, with more or less truth, to nearly all the others; the social principle, in spite of any little peculiarities special to this or that society, being common to all. The Carlton Club—the great political club of the conservatives—consists of eight hundred members, exclusive of peers and members of the House of Commons: the entrance fee is ten, and the annual subscription fifteen guineas. The Reform Club, which is the great place of meeting for whig politicians, consists of fourteen hundred members, exclusive of many gentlemen who are life, or honorary members the entrance fee is ten guineas, and the yearly subscription twenty-five guineas. Then there are the Conservative Club, with 1,500 members; the Army and Navy, United Service, Guards, Junior United Service, and the Naval, Military, and County Service, clubs, the latter of which occupies the premises in St. James's-street so long notorious as Crockford's: all these, as their names import, are open only to officers in the army or navy, and their subscriptions average about six guineas per year for each member. The members of the learned profession have two clubs of their own, the University and the Oxford and Cambridge; there are two clubs, the Oriental and the Travellers', open only to gentlemen who have made the tour of Europe, or have resided in the East; while the other large clubs open to gentlemen of any shade of politics or any profession, number about twenty; the entrance fees to which range from thirty to nine guineas, and the subscriptions from five to twelve guineas.

It will be seen that the advantages of such clubs as come within the ordinary meaning of the term, are confined exclusively to the rich. In 1848, however, Douglas Jerrold, Cowden Clarke, Charles Dickens, Thackeray, and other celebrated literary men, conceived the idea of founding a club for the middle classes which should combine the best features of the West-end establishments with those of a literary and scientific institution. Proposals were made, a fund collected, a large house taken in the Strand (formerly the Crown and Anchor Tavern), and the Whittington Club was the result. This club now boasts fifteen hundred members, and promises to secure for a large and praiseworthy class of young men all the advantages which the more ambitious associations of the West-end offer. Here, for a subscription of two guineas annually, the members enjoy the privilege of a good library, and reading-rooms which are supplied with all the best periodicals and newspapers of the day; dinners and refreshments may be obtained at all times at the most moderate prices, and various apartments in a goodly mansion are supplied with all that is necessary to ease and comfort. But perhaps the most noticeable peculiarity in the Whittington Club is the freedom enjoyed by all, and the absence of that air of exclusiveness common to the larger establishments. Ladies are admitted as members, and weekly meetings are held in the withdrawing and ball rooms, admission to which is free. Besides this, classes for the teaching of various languages and accomplishments have been formed under the direction of competent tutors; and the whole affairs of the institution are under the direction of a committee of management drawn annually from among the members.

The social influence of clubs and club life on the residents of London is by no means small. It may be seen in the improved tone of society among the upper classes; in the decreased number and better management of hotels and taverns, and in the higher taste for the useful and the beautiful observable among the youth of the aristocracy. What the literary and scientific institution is to the mechanic, the club-house is to the lord.

We are, most of us, as Doctor Johnson observed in his own peculiar way, "very clubable people."

ERIN-GO-BRAGH:

A TRUE IRISH STORY.

Oh, sad is my fate, said the heart-broken stranger
The wild deer and wolf to a covert can flee,
But I have nó refuge from famine and danger,
A home and a country remain not for me

Ah! never again in the green shady bowers,
Where my forefathers lived, shall I spend the sweet hours,
Or cover my harp with the wild woven flowers,
And strike the sweet numbers of Erin-go-bragh.

Campbell.

In the year 1810, a native of Philadelphia resided in the city of Altona, and became intimately acquainted with Gen. McC——, who commanded the Irish patriots at the battle of Ballanahench.

The general was a real Irish gentleman, with a heart alive to every refined sympathy of human nature, and warmly attached to Americans and the American character. Never can it be forgotten by those who were so happy as to share his confidence, how his fine manly countenance would light up, as he listened to the answers his questions would draw forth, when inquiring into the private characters of any of our revolutionary sages or soldiers.

Often would the tears start into his eyes—his whole soul would appear to flash from his expressive eye, and he would burst forth with the exclamation: "Oh, Erin, oh my beloved country, from which, alas! I am banished, when will thy heroes arise and burst the bands by which thou art enslaved? Excuse me," he would say, "excuse the companion of the Emmets, the McNevens, and others, who were confined with me in Fort George, in Scotland, from whence I was transported hither—banished! What a word! banished from the home of my childhood—torn from the land where my forefathers dwelt!" On one occasion of this kind, when the most of the company had retired, in his own hospitable mansion, he invited his friend to remain and hear the sad story of his life.

He rose from the table, and going to a book-case, he produced a copy of Campbell's poems, and turning to the beautiful song of Erin-go-bragh—"There," said he, "is my history, I am the original Erin-go-bragh. My countrymen, I am told, often inquire how it happened that a Scotchman should write this national, this glowing account of the wrongs of my devoted countrymen. Listen to me, and I will truly tell you the whole story—that is, if I can tell it! If I can sufficiently compose myself, *you* shall hear it; and should you survive me you may publish it, that the mystery may be solved, and the world may know how the heart of a Scotch poet was touched with the holy sympathy of our common nature, and has placed on record, in the most exalted and touching numbers, the feelings of an Irish exile. While confined in the fortress of Fort George, I was, without any knowledge of what was to be my fate, conveyed to a seaport and put on board of an English frigate, to be banished I knew not whither!" (The name of the port of embarkation and of the vessel were given, but are not now remembered.) "On board of this vessel was Campbell, the Scotch poet, then about to make his pedestrian tour on the continent of Europe. It was not long before we became intimately acquainted, and as you may suppose my whole heart was filled with wo

"During our passage to this place, we had many and very close conversations, pending which I poured into his ear, in impassioned language, the sad, the overwhelming woes of my countrymen, and particularly my own hard fate.

"We were not very long in reaching our destination, we landed together at Altona, and what was my surprise to find my companion almost as destitute of money as myself. I had been hurried away without the knowledge of my friends, who had no intimation of my banishment, and coming from close confinement, was not overburdened with a wardrobe, much less with the necessary funds for decency, to say nothing of comfort.

"Campbell was as poor as myself; and in this condition we entered a very common inn, and were ushered into a room, not very well furnished, having nothing but an oaken table and a very few common chairs. We seated ourselves at opposite sides of the table, and gazed at each other with no enviable feelings, when, on examining our exchequer, we found the whole sum in the treasury amounted to no more than a crown. We called for a candle, for it was growing dark, and ordered, in consonance with our finances, some cheap refreshments. The light came, and you must believe me when I tell you it was a dip candle stuck in a black bottle. There was something so ludicrous in this, and in our general circumstances, that we both indulged in a hearty laugh

"As our spirits were operated upon by the wretched liquor, which we drank more to drown the rising sigh than for any partiality for it, Campbell called for pen, ink, and paper. 'Mr. McC,' said he, 'your story has deeply interested me, and a kind of notion has arisen that I should like to put it upon paper.'

In a little time a miserable inkhorn was produced, and something which was called paper, but it was so stained, and otherwise disfigured, it seemed almost impossible, with the wretched pen that accompanied it, that legible characters could be traced upon it; and I could but indulge in my risible propensities, at the idea of any attempt to write with such materials.

"But the soul of the poet had been aroused, and he bade me again to refresh his memory with my tale, which I did by replying to such questions as he from time to time propounded to me. At last he finished his labours, and the result of them was the song of Erin-go-bragh, the very song printed in his works, and which I now hand to you.

"This is a true history of that inimitable production, more full of feeling, in my opinion, than anything he has ever written before or since."

"Read it to me," said the general, "for if the king would withdraw the act which banished me, the object nearest my Irish heart, I could not read that song aloud!"

Such was the story told to the writer, as nearly as it can be remembered, after a lapse of thirty-eight years. There are yet living several persons who will recognise it, and an appeal to them for the accuracy with which it is here told, would confirm it in every particular; its only defect being the absence of power in the writer to impart to his readers anything of the enthusiasm with which General McC. related it—nor the heart-stirring emotion ever exhibited by him when it became, as it often did, the subject of conversation.

As the reader may feel desirous to know what was subsequently the fate of the real and original Erin-go-bragh, he may be told that his friends found out where he was, remitted him funds, that he embarked in a profitable pursuit, and ever after lived in comparative affluence.

The story of his marriage is of so romantic a nature, that as he is now no more, and there is therefore no impropriety in giving it publicity, the writer is tempted to narrate it, as he has often listened to it from the lips of the general, at his own agreeable board in the presence of his wife.

"There she is," he would say, "she is my preserver! Campbell and myself continued in our lodgings, and with the bill of expenses, but alas! our means exhausted

"When the bill for the first week was presented to us, 'Well,' said the poet to me, 'what do you propose to do, general?' To which I replied, 'Do!—what do I propose to do, did you ask me? I might put the same question to you—but no! let an Irishman alone for getting out of a scrape. I will call up the landlord, and tell him our story; adding, that I expect ere long my relatives will find out whither I have been sent, and it cannot be, but that in a short time funds will be sent to me. Suiting the action to the word, I rang the bell, the landlord appeared, and I gave him our story in a few words, for though a German, he was well acquainted with our language. 'An Irish general,' said the apparently incredulous Boniface, 'and a Scotch poet!' He left us with the exclamation, and after he had gone, I proposed a walk, to which my companion assenting, we strolled around the city of Altona, and returned to our lodgings, without having met with any occurrence worthy of remark. Being somewhat fatigued, and having no book, or other means of occupation, we retired to our humble chamber, which had in it two single beds, by no means luxurious.

Another week of anxiety passed away, and no advices reached either of us, and the poet and myself were in a considerable dilemma. Another bill was presented, but to our great surprise we found our host very lenient indeed. He made no remark when presenting it—simply asked me had I received my funds, and on expressing my mortification that my reply must be in the negative, he left me with a polite bow.

"'The aristocracy,' said the poet, 'are here none of the best, but our host is an honest fellow, we have inspired him with confidence, and he appears content to wait!'

"I know not how it was, but I felt a strange sensation come over me, a feeling that relief was at hand. So strongly was I impressed with this belief that I communicated it to my friend, who laughed out at what he called my Irish modest assurance.

"'Relief,' he said, 'may come when your relations hear of you, but my word for it, that will not be soon. No, no, there is no relief.'

"He, however, yielded to my solicitation to walk, which was always my resource, and as we left the house, I said to him, 'Campbell, when we come back I shall hear something.'

"'If you do,' said he, 'it may be in the shape of a dun for our unpaid bills.'

"'You will see,' I replied; when we sallied forth, and were gone perhaps an hour. On returning to our room, judge of the sensation I experienced when I discovered on the oaken table, a neat envelope directed, in a female hand, 'To Gen. A. McC.' With an eagerness much more easily conceived than described, I broke the seal—not a line of manuscript did it contain—but for a moment my heart leaped with joy, for I found within the envelope a Schleswig Holstein bank bill of twenty dollars! Although my surprise was without bounds—'Did I not tell you,' said I to my friend, 'that relief was at hand?'

'Our treasury was now replenished, and we had a fruitful subject of conversation." Addressing himself to his attentive listener, "I wish," said the general, "you could have seen the stride with which I paced up and down that room. Never in my whole eventful life had I such commingled sensations. My pride was gratified, that I could now discharge our indebtedness to our host, while I suffered the deepest humilia-

tion in the reflection, that I was considered an object of charity by some unknown person! My curiosity was at fault to determine who it could be, and I shall never forget Campbell's looks as he exclaimed, 'You have conquered here, if you could not in Ireland. But it is Cupid who has been your aid. The handwriting, the neatness of the billet, and its diminutive proportions, all declare it to be a *billet-doux*. My word for it, your Irish complexion and figure have taken captive the heart of some fair lady!' This idea greatly added to my embarrassment, but the pride of being enabled to discharge our indebtedness, overcame for the moment all my other sensations, and strutting up to the bell, I rang it with so much violence, that our landlord ran up in an instant, and demanded to know what was the matter? '*Bring your bill*,' said I, 'that I may at once discharge it.' I thought this would be the most agreeable intelligence I could give him. What, then, was our joint surprise, when he replied, 'That, gentlemen, is of no kind of importance; I pray of you give yourselves no uneasiness on that score—you can pay me at your convenience.' Saying this, he departed, leaving my friend and myself more deeply involved in the mystery which had not only supplied us with money, but which had also placed us in such ample credit.

"'You see,' said the poet, 'you are known, and Cupid has taken you under his special protection.'

"Time now passed more pleasantly. The second Saturday brought another note, addressed in the same handwriting, containing a second bank note of the same amount. Finding our finances so much improved we took better lodgings, and indulged ourselves with more of the creature comforts, for the unknown benefactor found us out in our new abode, and continued the supply, which enabled us to do so.

"I think," continued the general, "it was in the fourth week that I was returning to my lodgings alone, in the dusk of the evening, when one of the flag-stones of the pavement being somewhat raised above its fellows, caused me to strike it with my foot, and being thus thrown from my equilibrium, I fell against the porch of a dwelling, in which was seated a lady, who did not attract my attention until I heard a voice, a sweet voice, which inquired if I was hurt. A voice in my native tongue uttering sounds of sympathy would have been accompanied with a charm, come from whom it might, but imagine the ecstasy with which I was thrilled when I heard the sweet voice which addressed me, and knew it to be from the lips of a fair daughter of the Emerald Isle—in plain English, an Irishwoman.

'I hope you are not hurt, general?'

''General!' she knows me, then, thought I.

''Come,' said she, 'and rest yourself in the porch.'

'I could no longer contain myself.

''Tell me,' said I, 'by what blessed influence I have been thus brought to listen to the sweet sympathising accents of a countrywoman, and one who appears to know me: for if I mistake not you addressed me by my title—the sad, sad title which calls up all my afflictions, and revives the sad fate of my companions in a strife which failed to benefit our beloved country, proved fatal to one of the best men, and sent me hither a wandering exile.'

"There," said he, pointing to his wife, then present, "there sits the angel of mercy, who poured into my attentive ears, till they reached my inmost soul, accents attuned to the most holy of all earthly consolations—accents of sympathy for me, and the most noble and heroic sentiments, applauding the course of our dear native land."

"Now," said the lady, "I pray of you do not yet into your heroics:" and addressing their guest, she continued,—"Receive what he says with many allowances, for on this subject he is insane. I forgive him, for he has suffered much in the cause of that dear land from which we both derive our birth; and you who know him know that he never thinks or speaks of dear Erin and his exile,—of a spot for which he is ready to shed the last drop of his blood,—that his whole soul is not on fire. Of this he may talk to you; and if you will listen to him, he will do so till to-morrow's sun shall warm you with his meridian rays; but I forbid him to talk of me and of our union."

"Forbid!" said the husband, "there is no such word in the vocabulary I will tell this to our friend, for you know I love him. I will tell him how you courted me, and how you saved me, and made me what I am—your happy husband."

To this the fond wife would reply, deprecating the continuance of his narrative, which, however, did not prevent him from doing ample justice to every incident which occurred, from the time of their first accidental meeting, as here related, until Hymen had sealed a union which had made both husband and wife as happy as they could be under the circumstances of his banishment. This was a continual source of chagrin and mortification to his heroic soul; and never could Ireland be named within his hearing that the tear did not start in his eye.

The substance of his love affair was, that the lady of whom we have spoken was an Irish lady, who had come when a young woman with her parents to Altona, had married a young German, who did not long survive their union. She was left in very comfortable circumstances; and hearing from the keeper of the inn that a person was an inmate with him, calling himself an Irish general, who had been banished, and who had not heard from his friends, and was without funds, she had sent him the weekly supply which so much astonished the poet and the general. The innkeeper, knowing the lady to be an Irishwoman, had gone to consult her as to the probability of the general's story, and had been told to withhold nothing, and that she would be responsible. Often did she tell the writer that she sent the money without any expectation of ever seeing the recipient, who was represented to her as so fine-looking in person, that he could not be an impostor. She believed him to be a veritable Irishman in distress, and—that was enough—had she never seen him, he was a countryman of hers, and had a right to anything she could do for him—happy to have been furnished with an object to call forth her patriotic feelings, to exercise them in his behalf was her greatest delight. Pure accident had given her a knowledge of who was the cause of calling them forth, and his heart was touched, and hers responded to his love. They had been several years married when the writer became acquainted with them. Their home was the abode of peace and contentment, and a hospitality that knew no limits.

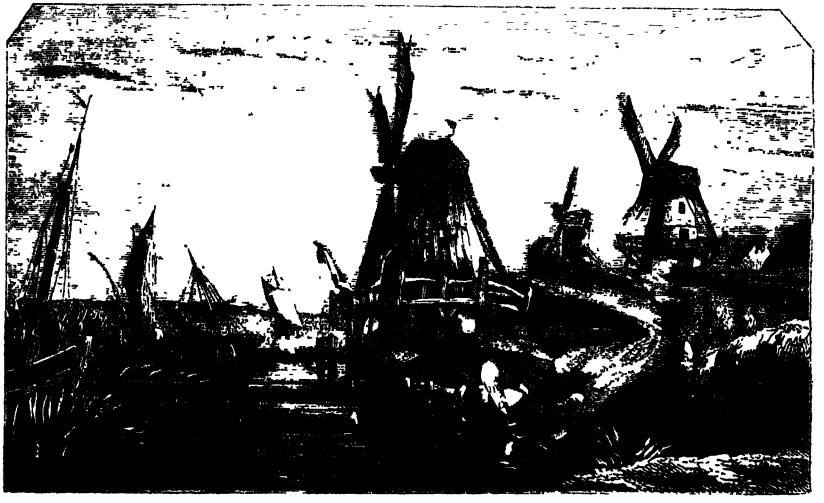
His sentence of banishment was remitted many years after the period here spoken of, and he was permitted again to return to the home of his childhood and the land of his forefathers, for which he had bled, and for the redemption of which he was ever ready to lay down his life—but it was not so ordered. He died in peace, and was buried in the tomb of his ancestors. General Anthony McCann was the veritable and original "Erin-go-bragh."

HOLLAND.

Holland, or the Netherlands, comprising the territories formerly included within the Seven United Provinces, may be considered in many respects as the most wonderful country, perhaps, under the sun; it is certainly unlike every other. What elsewhere would be considered as impossible has here been carried into effect, and incongruities have been rendered consistent. "The house built upon the sand" may here be seen *standing*, for neither Amsterdam nor Rotterdam have any better foundation than sand, into which piles are driven through many feet of superincumbent bog earth. In Holland, the very laws of nature seem to be reversed; the sea is higher than the land—the keels of the ships float above the chimneys of the houses, and the frog croaking amongst the bulrushes looks down upon the swallow upon the house-top. Where rivers take their course, it is not in beds of their own choosing; they are compelled to pass through canals formed of human art and industry, and even the very ocean itself appears here to have half obeyed the command, "Thus far shalt thou go and no farther."

No description can convey the slightest notion of the way in which Holland has been gathered, particle by particle, out of the waste of waters, of the strange aspect of the country, and the incessant vigilance and wondrous precautions by which it is preserved. Holland is, in the fullest sense, an alluvion of the sea. It consists of sand and mud rescued from the ocean, and banked up on all sides. Produced by the most dexterous and indefatigable exertions, it can be maintained only by artificial means. If the efforts by which it was redeemed from the

waters were to be relaxed, the ocean would reassert its rights, and the whole kingdom would be submerged. The slightest accident might sweep Holland into the deep. It was once nearly undermined by an insect. Indeed, the necessity of destroying insects is so urgent that the stork, a great feeder upon them, is actually held in a sort of veneration, and almost every species of bird is religiously protected from injury. Bird-nesting is strictly prohibited by law. The drift of all this is palpable enough. But it is curious that the very existence of a great country should depend upon such guarantees.



Holland is destitute of iron, coal, and timber, and is a commercial rather than a manufacturing country. In the manufacture of smalt, and the grinding of vermillion, rouge, &c., the Dutch have long been celebrated; and it is a curious fact that in some of these points neither France nor England can compete with them in point of excellence. The manufacture of white lead is carried to great perfection in Holland. Abundance of excellent wheat is grown near Utrecht, and the wheat of Friesland is extremely good. Woad and madde also extensively grown, and flax is raised in large quantities in the south, especially round Dort, which is the centre of a considerable trade in that article. Chicory is also much cultivated, as well as the hemp, flax, and other oily seeds, especially colza and rape. Vast quantities of grain are consumed in the distilleries of Schiedam and other places. In Schiedam alone there are upwards of 100 distilleries, and 30,000 pigs are fed with the refuse grain after the spirit has been extracted. How many thousand families might be supported in the grain thus wasted!

The principal manufactures in Holland are those of woollen cloths and blankets at Leyden and Utrecht; of silks and velvets at Utrecht, Haarlem, and Amsterdam; of linen at Boxtel; and of paper, leather, cordage, hats, ribbons, needles, glue, &c. Several cotton factories were established near Haarlem under the patronage of the late king; these have increased both in number and in the quantity of goods manufactured since the separation of Holland from Belgium.

The extensive bleaching-grounds of Haarlem are well known; they owe their reputation to some peculiar property supposed to exist in the water. Before the introduction of chlorine as a bleaching agent, the fine linens made in Silesia, as well as those of Friesland, were sent hither to be bleached; and being thence exported direct to England, were named after the country from whence they were embarked, not that in which they were made. Such fabrics are still known in commerce by the name of white Holland, brown Holland, &c.

Among the principal articles of domestic produce exported from Holland to Great Britain, are butter, cheese, flax, seeds, grain of different kinds, tobacco, spirits, raw and thrown silk, and silk manufactures; and of colonial produce from Java, &c., coffee, sugar, nutmegs, cloves, mace, and other spices, Banca tin, &c.; for which Holland takes from us in return, coal, cotton goods and yarn, earthenware, hardware and cutlery, iron, steel and other metals, salt, linen, silk and woollen goods. 200,797 cwt. of butter, and 271,375 cwt. of cheese were imported into this country from Holland in 1849.

The Dutch herring fishery, although of some importance, has very much fallen off; scarcely 200 herring vessels are now sent out from the whole of Holland, instead of 2,000, the number employed in former days. The English word *pickle*,

INE IN HOLLAND.

is derived from the Dutch *pekel* (brine). Very strict regulations are in force relative to the taking, curing, and packing of herrings, with the view to secure to the Hollanders the superiority which they had early attained in the fishery, to obtain for the Dutch herrings the best price in foreign markets, and to prevent the herrings being injured by the bad faith of individuals.

Everybody knows what a Dutch cheese is; but everybody does not know that the manufacture of those little round balls of cheese is a matter of considerable importance, and a source of great wealth to the province of North Holland. The cleanliness of the Dutch is proverbial, and nowhere is this fact more noticeable than in the country farmhouses; nine-tenths of the poor people of Great Britain not being so well and cleanly lodged as the cows in Holland. At these farmhouses may be seen the cheeses in various stages of preparation; some in the press, others soaking in water and imbibing salt, and every part of the process distinguished by the most refined cleanliness. A vast quantity of these sweet milk, or Edam cheeses, as they are styled, are made in North Holland. They

waters were to be relaxed, the ocean would reassert its rights, and the whole kingdom would be submerged. The slightest accident might sweep Holland into the deep. It was once nearly undermined by an insect. Indeed, the necessity of destroying insects is so urgent that the stork, a great feeder upon them, is actually held in a sort of veneration, and almost every species of bird is religiously protected from injury. Bird-nesting is strictly prohibited by law. The drift of all this is palpable enough. But it is curious that the very existence of a great country should depend upon such guarantees.

Holland is destitute of iron, coal, and timber, and is a commercial rather than a manufacturing country. In the manufacture of smalt, and the grinding of vermillion, rouge, &c., the Dutch have long been celebrated; and it is a curious fact that in some of these points neither France nor England can compete with them in point of excellence. The manufacture of white lead is carried to great perfection in Holland. Abundance of excellent wheat is grown near Utrecht, and the wheat of Friesland is extremely good. Woad and madder are also extensively grown, and flax is raised in large quantities in the south, especially round Dort, which is the centre of a considerable trade in that article. Chicory is also much cultivated, as well as the hemp, flax, and other oily seeds, especially colsa and rape. Vast quantities of grain are consumed in the distilleries of Schiedam and other places. In Schiedam alone there are upwards of 100 distilleries, and 30,000 pigs are fed with the refuse grain after the spirit has been extracted. How many thousand families might be supported in the grain thus wasted!

The principal manufactures in Holland are those of woollen cloths and blankets at Leyden and Utrecht; of silks and velvets at Utrecht, Haarlem, and Amsterdam; of linen at Boxtel; and of paper, leather, cordage, hats, ribbons, needles, glue, &c. Several cotton factories were established near Haarlem under the patronage of the late king; these have increased both in number and in the quantity of goods manufactured since the separation of Holland from Belgium.

The extensive bleaching-grounds of Haarlem are well known; they owe their reputation to some peculiar property supposed to exist in the water. Before the introduction of chlorine as a bleaching agent, the fine linens made in Silesia, as well as those of Friesland, were sent hither to be bleached; and being thence exported direct to England, were named after the country from whence they were embarked, not that in which they were made. Such fabrics are still known in commerce by the name of white Holland, brown Holland, &c.

The Dutch herring fishery, although of some importance, has very much fallen off; scarcely 200 herring vessels are now sent out from the whole of Holland, instead of 2,000, the number employed in former days. The English word *pickle*, is derived from the Dutch *pekel* (brine). Very strict regulations are in force relative to the taking, curing, and packing of herrings, with the view to secure to the Hollanders the superiority which they had early attained in the fishery, to obtain for the Dutch herrings the best price in foreign markets, and to prevent the herrings being injured by the bad faith of individuals.

SCENE IN HOLLAND.

Everybody knows what a Dutch cheese is; but everybody does not know that the manufacture of those little round balls of cheese is a matter of considerable importance, and a source of great wealth to the province of North Holland. The cleanliness of the Dutch is proverbial, and nowhere is this fact more noticeable than in the country farmhouses; nine-tenths of the poor people of Great Britain not being so well and cleanly lodged as the cows in Holland. At these farmhouses may be seen the cheeses in various stages of preparation; some in the press, others soaking in water and imbibing salt, and every part of the process distinguished by the most refined cleanliness. A vast quantity of these sweet milk, or Edam cheeses, as they are styled, are made in North Holland. They

are sold at the markets of Alkmaar and Hoorn, &c., and are exported thence to the most distant countries of the globe. 9,000,000 lb. of cheese are weighed annually in the town scales of Alkmaar. The quantity of cheese sold in 1845 was 1,300,000 Dutch pounds. The best is made at Gouda, and is called Gouda cheese.

The scene we have chosen for illustration exhibits two of the characteristic features of the country—windmills and canals. The mills are nearly always situated on or near the banks of the numerous canals, so that the corn, &c., may be easily carried to the coast, or into the interior of the country. Altogether, Holland may be considered one of the most surprising countries in Europe.

TREES OF LIBERTY.

With snatches of triumphant song,
And loud huzzas of jubilee,
Proceeds the wild, rejoicing throng,
And plants its tree of Liberty!
Awhile, the People's tender care,
Protects its softly budding shoot,
But soon they see, in blank despair,
A canker eating at its root
Their Children's seat will never be
Beneath that Tree of Liberty!

With hymns of hope within our heart,
With deep and earnest souls of prayer
Let us begin our needful part,
But *not* with shouts upon the air,
With gentle, steady-moving hand,
Pour in bright Knowledge as a stream,
Chase Ignorance throughout the land,
Efface her dim deluding dream,
Tear off the chains with which she binds,
And open wide her fetid den,
Uproot our timid, crouching minds,
And make them into free born Men!
Thus shall we *earn* a jubilee,—
Thus plant our Tree of Liberty

Dark slavish Fear hath held the world
In close and dismal bondage long,
Till germs of goodness have grown weak,
And weeds of wickedness waxed strong.
Oh, raise up high the great flood-gates,
The golden gates of radiant Love,
And teach men to discard old hate,
And in new ways of Peace to move
One act of love is better worth
Than thousand servile deeds of fear,
Fear, dwarfing men to coward slaves,
While noble Love doth *freemen* rear!—
Thus, thus, with earnest hope we would see
Uptrain our Tree of Liberty!

And, in due season, golden fruit
Will hang upon its branches fair,
No canker eating at its root,
No drooping leaves upon it there,
The Despot's hand in vain may try
To move it from its olden place,—
'Twill, calm, withstand his evil eye,
Or, sweetly laugh into his face!
And all good spirits, though unseen,
Will nurture it with blessed dew,
Preserve its foliage evergreen,
And train its form to Beauty true
Oh, quickly help, whoe'er ye be,
To plant *such* Trees of Liberty!

MARIE.

GAME PLAYERS.—I do not see (says a writer in the *Notes and Queries*) that any of your numerous correspondents have mentioned the common belief among the poor in this county (Sussex) that a person cannot die if his bed is stuffed with game feathers. A friend of mine, a little time back, was talking to a labourer on the absurdity of such a belief; but he failed to convince the good man, who, as a proof of the correctness of his belief, brought forward the case of a poor man who had lately died after a lingering illness. "Look at poor Master S——, how hard he were a dying! Poor soul, he could not die ony way, till neighbour Puttick found out how it wer. 'Master S——,' says he, 'ye be lying on geame feathers, mon, surely,' and so he wer. So we took'n out o' bed, and laid'n on the floore, and he pretty soon died then."

EXERCISES FOR INGENUITY.

SOLUTIONS TO QUESTIONS IN No. 30, APRIL 24.

1. To plant four trees at equal distances from each other, it would be necessary to place one on each point of the base of a

Tetrahedron

tetrahedron, and a fourth on the apex. A *tetrahedron*, as defined by Euclid, is a solid figure, bounded by four equilateral triangles; and to place the four trees as proposed, it would be necessary to raise a mound on the base of an equilateral triangle, so that the top of it, where the fourth tree is to be planted, should be equally distant from the three points of the middle triangle or base.

2. J. Robertson, of Aberdeen, has forwarded a list of 691 separate words found in the one word demonstration, and 121 in grandfather; and S Clark, of Plymouth, finds 475 words in demonstration, and 240 in grandfather. Several correspondent give lists containing a fewer number of words than the above.

3. DAVID. S. A. Jacob, and a hundred other friends.

4 The inscription on a guinea ran thus: Georgius III., Dei Gratia, M B F ET H. REX, F D. B. ET L.D. S R.I A T. ET E.—Which is, in full,—Georgius Tertius, Dei Gratia, Magnæ Britanniæ Franciæ et Hiberniæ Rex, Fidei Defensor, Brunswicensis et Lunenburgi Dux, Sacri Romani Imperii Archi-Thesaurarius et Elector. Translated, the inscription is,—George the Third, by the grace of God, King of Great Britain, France, and Ireland, Defender of the Faith, Duke of Brunswick and Luneburg, Arch-Treasurer and Elector of the Holy Roman Empire.

5 If 7900 be multiplied by 1760, the number of yards in a mile, it will give 13904000 as the diameter in yards. This multiplied by 3.1428 (.1428 being the decimal of 1-7 th) will give 43674912 0000 yards as the circumference If the man's height were taken at two yards, the diameter would then be 13904000 yards, which, being multiplied as before, would produce 43674924 5712 the difference, being 12 5712 yards.—M. A. X

6 WOMEN. Poetical solutions received from Clara, R. A Linward Edwards, and a number of other correspondents.

7 He purchased the last-mentioned stock at 262½

8 The solution was just, for, suppose the loaves divided into three equal parts—24 parts in the eight loaves—and each person to eat an equal or eighth part, the stranger would then have but seven parts of the nine contributed the five loaves, or fifteen parts and but one part of he who contributed the three loaves

9 The bill was discounted at the nominal rate of 5 per cent., but the real rate was $4\frac{76}{101}$

10 The town of Bevel, in Upper Garonne, entitled to beheaded, is EVE.—W. R. S. The town of NEVER.—Ann Newsom

11. A SHOE. Answered by numerous friends.

12 45 is the number, which may be divided into 4 parts,—8+12+5+20=45. To the first part you add 2: 8+2=10 from the second part you subtract 2: 12—2=10; the third part you multiply by 2: 5×2=10; and the fourth part you divide by 2 20÷2=10. Consequently, the *sum* of the addition, the *remainder* of the subtraction, the *product* of the multiplication and the *quotient* of the division are precisely the same 10. This question admits of several answers

13. It would appear that Abraham had very early purchased slaves with money (Gen xvii 13); but the first special transaction was that mentioned in chap. xxiii. of Genesis, in which he purchased the cave of Machpelah as a burial-place for his wife Sarah.

Robert Middleton

14. Because the air, being rarefied by the sunshine, flows more slowly to the fire The candle, not being confined as a grate, cannot replenish itself, by drawing a greater quantity of *air* to itself.

Bennet Lowe

15. The gentleman's age was 72. Thus, 60 years ago he was 12 years of age. The square of which, 144÷2=72.—Thos. C. Killip

16. Unanswered.

17. The word STATIONER, whence stationery, is derived from the Latin *statio* (station), because they used to have all their stall. or shops in one station or street.—T. J. Robertson, Morpeth.

The title of stationer was assumed by the London booksellers shortly after the invention of printing, from their custom of keeping fixed shops or stalls, unlike other vendors who were at that time itinerant. *Hence the origin of the term stationery.*—Robert Middleton.

18. 1+5+7=18 1×1= 1
5×5=25 diff. 24
7×7=49 diff. 24
—
75 proof. J. W.

19. As 70 . 40 : 10 : $\frac{400}{70}=5\frac{5}{7}\times2=11\frac{3}{7}$ diameter of 1st wheel.

10 $5\frac{5}{7}=1\frac{2}{7}\times2=8\frac{1}{7}$ ditto of 2nd wheel.
Ewol Tenneb.

20. Ope (open). Answered by more than a hundred correspondents.

21. If twelve oxen eat $3\frac{1}{3}$ acres in 4 weeks, 36 oxen will eat 10 acres. Then, $36\times4=144$, and $21\times9=189$, increase, 45 in 5 weeks, and the increase in 14 weeks will be 5 14 . 45 126, which $+144=270$, and $270\div18=15$ oxen, but in the last case there is 21 acres; therefore, 10 21 · 15 · 36, or *6 oxen will eat 21 acres in 18 weeks*.

Or, if 21 oxen eat 10 acres in 9 weeks, 7 oxen will eat $3\frac{1}{3}$ acres in 9 weeks, then $12\times3\frac{1}{3}\times4=160$, and $7\times3\frac{1}{3}\times9=210$, increase 50 in 5 weeks, and 5 14 50 · 140, which $+160=300$, and $300\div(3\frac{1}{3}\times18)=5$ oxen; but there is 24 acres instead of $3\frac{1}{3}$ acres, therefore, 3½ 24 3=36 *oxen*, which is the number required.—Robert Middleton.

22. 8 hours 15 minutes, a m.
8,45+5 10=11,25, or 2,25, p m
8,15 2,25 105 29, the proof of its correctness
A Correspondent from Milton Street.

23. A had 1, B, 5, and C, 7 sovereigns Thus, 1+11=12, 5+11=16; 7+11=18

24 Suppose she bought 21 at 4 for a penny, that would be 5¼d., and 21 at 3 for a penny would be 7d.
Then $5\frac{1}{4}$d+7d=1s 0¼d Then 12 sold at 7 for 2d. would be 1s.—taken from 1s 0¼d would show a loss of 0¼d
Then 0¼d. : 42 24 farthings 504 at 4 for 1d 126
12 504 . 3 .. 168
—
18 294
96 1008 7 (= 288
for 2d)
—
2) 1008 Proof . 6 loss.
—
504 of each sort.

25. A Thorn in the foot.—R H, *Droyden*, and many others

26. In about 21¼ years.—Alex. Murray
In 20 years, 212 $\frac{236}{5}$ days.—John Mathers

27. *Nine* trees can be disposed in *ten* rows, if planted in the manner shown in the diagram: the reader will perceive how ten lines can be drawn from the various points.

* * *
* * *
* * *

Thomas Palmer

28 The periphery of the fore-wheel was 4 yards, and the mind wheel 5 yards.—J M'C.

29. This is a kind of *catch* question, to which a correspondent replies as follows:—"I suppose the answer you want is two kings,—*viz.* James I and George I, but I say that all sovereigns of England were kings (and queens) before they were crowned, otherwise you invalidate the claim of Edward V."

30. The ½, ½, 1-6th, and 1-19th of 19s. are, 9s 6d+6s. 1d.+3s. 2d.+1s.=20s.—Stephen Constantine, and John Plant.

31. Unanswered.

32. Snowdrop. Answered by several correspondents.

33. Let x=income of each
$\frac{4x}{5}$ A spends. $\frac{1x}{5}+80$ B spends.

A saves £25. $\frac{16x}{5}=320=4x+220$

B spends 80+25=£125. $16x+1600=20x+1100$
500 $1x$
x=125=income of each.
Ewol Tenneb.

34. 22+5=27, 31−4=27; 9×3=27; 54÷2=27. Thus, 22+31+9+54=116 the number.—W. Martin.

[From the immense number of letters received, it was impossible to acknowledge separately the various solutions, much less to give complicated workings Our friends must content themselves with the assurance that we fully appreciate the value of their labours, and thank them for the interest they take in the Exercises. If they would also endeavour to *merit* a few good questions—always being careful to send the solutions with them—they would at once benefit themselves and us.]

Questions requiring Answers.

1. Three women went to market with eggs, the first had 50 to sell, the second 30, and the third 10 All three sold after the same *rate*, and obtained the same amount of money. How was this?

2 If a wheel be 11 feet high, what length of iron will be required for the tire?

3. What debt will be discharged by weekly payments, of which the first is 5s and the last £2000, the ratio being 2.—J. M'C.

4 A gentleman who had purchased a new hat was asked how much he had paid for it He answered, "If to the sum you add the one half, one-fourth, and one-third of itself, you will have the sum of 11s 7d What did he pay for his hat?

5. If six the third of twenty be,
What is the fourth of thirty-three?

6 What two numbers are those whose product is equal to the difference of their squares, and the sum of their squares equal to the difference of their cubes?

7 When and by whom was England divided into parishes? and when arose the practice of hanging churches and dwelling-houses with holly and evergreens at Christmas?

8. What causes the snow to appear white?

9 What were crowns originally, and who may be said to have worn the first golden one?

10 Divide a guinea into 21 pieces of money, which shall contain neither half-sovereign, crown, half-crown, shillings, sixpences, fourpenny pieces, threepenny pieces, pence, or halfpence.

11 A young girl was sent to a farm to purchase eight quarts of milk, which she carried in an eight-quart pot As she was returning, she met a young woman, with a five-quart tin and a three-quart tin, going to the same place for the same quantity of milk She told her she had got eight quarts, and that the former had no more to dispose of, but, if she had a mind, she would let her have four quarts of hers So they divided the milk, with these measures, into equal parts How did they do it?

Charade.

I'm an article much used in this nation,
Yet on me some folks want to put a taxation
Take one letter from me, and soon you can
See what is very beneficial to man
Take two letters from me, and then will appear
What I'm sure you do every day in the year.
Required, a poetical answer.

LITERARY NOTICES.

The Illustrated Exhibitor and Magazine of Art.—The First Volume of this splendidly embellished work, handsomely bound, price 6s 6d., extra cloth gilt edges, 7s. 6d., will be ready July 1, and will contain upwards of Two Hundred Principal Engravings, and an equal number of Minor Engravings, Diagrams, &c

Completion of John Cassell's Library.—This invaluable Work is now complete, in 21 Volumes, 7d each in paper covers; double Volumes, cloth, 1s 6d, &c. when 4 Vols in 1, 2s 3d The entire Series may be had, bound in cloth, 19s 6d, or arranged in a Library Box, 25s

Fine Edition of the Popular Educator—Education of Families.—No publication has ever been welcomed with such tokens of approval from heads of families as this last of John Cassell's works An extra Edition, at 1½d per number, or in Monthly Parts, in a neat wrapper, at 7d., or when Five Numbers, 8½d., is now published, which is issued without the weekly headings Persons wishing for this Edition must be careful to order the "Extra Edition" The whole of the Numbers may now be obtained, or the first Two Parts—Part I., 7d., Part II., 8½d

Scripture Library for the Young, in Smiling Volumes.—The first two volumes of this attractive series of works, "The Life of Joseph," illustrated with sixteen choice engravings and maps, and "The Tabernacle, its Priests, and Services," with twelve engravings, are now ready

MISCELLANEA.

BREVITIES.—Some day it will be found out that to bring up a man with a genial nature, a good temper, and a happy frame of mind, is a greater effort than to perfect him in much knowledge and many accomplishments.—Blunt wedges rive hard knots —Childhood and genius have the same master-organ in common—inquisitiveness. —No man is wholly bad all at once.—In all true humour lies its germ—pathos.—We may do a very good action, and not be a good man, but we cannot do an ill one, and not be an ill man.—Surely some people must know themselves; many never think about anything else.—Truth, when witty, is the wittiest of all things.—Solitude is necessary in the moments when grief is strongest, and thought most troubled.

THE MINISTER AND HIS MAN.—"John," said a clergyman to his man, "you should become a teetotaller—you have been drinking again to-day." "Do you never take a drop yoursel', minister?" "Ah, but, John, you must look at your circumstances and mine." "Very true, sir," says John, "but can you tell me how the streets of Jerusalem were kept so clean?" "No, John, I cannot tell you that." "Well, sir, it was just because every one kept his ain door clean."

THE GENDER OF MYSTERIES.—There is not a mystery in creation, the symbol or practical invention for meanings abstruse, recondite, and incomprehensible, which is not represented by the female gender There is the Sphynx, and the Enigma, and the Chimera, and Isis, whose veil no man had ever lifted—they were all ladies, every one of them And so was Proserpine and Hecate, who was one thing by night and another by day The Sibyls were females, and so were the Gorgons, the Harpies, the Furies, the Fates, and the Teutonic Valkyrs, Norns, and, in short, all representation of ideas, obscure, inscrutable, and portentous, are nouns feminine.

A NEW MORAL TO AN OLD FABLE.—Don't live in hope, with your arms folded, fortune smiles on those who roll up their sleeves, and put their shoulders to the wheel.

VALUE OF GEOLOGICAL KNOWLEDGE —The neglect of geological knowledge in architecture has produced the most deplorable consequences, in the premature decomposition of magnificent structures, owing to the perishable quality of the stone employed in their erection. The Capitol, at Washington, in the United States, is rapidly crumbling down to its very base, and thus one of the most splendid senate-houses in the world presents a memorable record of the human ignorance which refused to learn, although a very easy page in nature's book was offered for perusal. This Capitol is built of perishable sandstone, while the marble quarries which have supplied materials for the admired public buildings of Baltimore lie within forty miles. The new church of St. Peter's, at Brighton, has already the appearance of dilapidated antiquity. Several colleges have been entirely rebuilt The bridges of Westminster and Blackfriars, which cost respectively £427,000 and £153,000, and are neither of them more than a century old, have several times required repairs nearly equivalent to renewal. The latter is now pronounced almost irrecoverable, while the former is under sentence, and will be removed as a new one can be erected in the same vicinity.

BRIEF CHEMICAL NOTES.

SOOT A PIGMENT.—Common coal-soot put into a bottle of water, shaken, the water poured off, and more added two or three times; then the lighter part, after the first settlement, poured on filter paper, dries a fine deep black-brown colour, which may be rubbed up with gum-water, in proportion as wanted, instead of Indian ink or lamp-black, for drawing diagrams.

CEDAR WOOD RESIN.—A peculiar resin was found to have exuded or evaporated, and attached itself to the polished surface of shells kept in a large new conchologist's cabinet, the interior wholly formed of cedar. It was washed off with spirits of wine, to which it imparted a most bitter flavour.

HIGH-PRESSURE STEAM.—Its instant production from cold water is ingeniously effected, by driving it with a force-pump through several feet of iron tubing, laid in a bath of fusible metal, kept at 500 deg. Fahr.,—a principle capable of extensive application

INCOMPRESSIBLE PRINTERS' BLOCKS.—Instead of blocking up large types or stereotypes with wood, or to adjust these where wood cannot be immediately or conveniently introduced, mix common white sand with strong glue, and it may be readily applied and shaped with a broad knife-blade When dry it will be very adhesive, as well as incompressible

TESTING BUILDING-STONES.—The varieties of red sandstone, and other building materials may be artificially tested in respect to the action of frost upon them, by immersing a small cubical block of each in a cold concentrated solution of soda, and then hanging them up by a string. Soft qualities will be disintegrated, hard suitable specimens will remain unaffected, after some days' exposure.

TEA AN ASTRINGENT.—If a decoction be stirred with the steel blade of a dinner-knife, it will soon form a tannate of iron, which, conveyed to a clean quill pen, may be written with

HORSE CHESTNUTS.—These would afford an abundant supply of farina, which may be employed in the manufacture of British gum for calico printers, &c.

MISCELLANEOUS RECEIPTS.

(By a Correspondent.)

A CURE FOR WARTS.—These troublesome tumours may be cured by applying milk of spurge a few days successively. They turn black with the first application, and die away gradually.

RECIPE FOR A MOST EFFECTUAL RAZOR-STROP.—Spread the well known blue-pill of the shops on buff leather, smoothing it with the razor back, and it is fit for use in the ordinary way. The blue-pill may be bought at any of the druggist's shop.

DISCOLOURED OR DAMP WALLS.—Whatever the impregnation such walls have received, several kinds appear wholly incurable, penetrating through fresh plastering, and rotting hollow cloth linings; but if the sheet-lead, which comes to us in the way of lining round tea-chests, be nailed up with copper nails against walls so affected, they may be papered immediately, and will resist the influence of whatever acid may be in the walls.

TO HASTEN THE RIPENING OF WALL-FRUIT.—Paint the wall with black paint, or lay a composition of the same colour, and the tree will produce not only more in quantity, in the proportion of 5 to 3, but the quality is also superior in size and flavour to that which grows against walls of a natural colour.

ANSWERS TO CORRESPONDENTS

H. EVANS.—We have reason to believe that there is a sufficient number of "lawyers' clerks" in America already.—You will find "easy lessons on mathematics" in "The Popular Educator."

A. Z. B. Y.—We have never heard "that the government, or any society, has held out any reward to any person who can furnish a successful plan for making a flying machine;" nor do we think it likely that they ever will.

PRINTER.—Gilding of glass, porcelain, &c., is performed by blending powdered gold with gum water and a little borax, and applying it by means of a camel's hair pencil; the article is then heated sufficiently hot in an oven or furnace, by which means the gum is burnt, and the borax vitrifying, cements the gold to the surface When cold, it is polished off with a burnisher Names, dates, or any fancy device, may thus be permanently and easily fixed on glass, china earthenware, &c.

J. D. C. D.—A correspondent using this signature, and several other correspondents, have written for information on various matters connected with emigration. We find it very difficult to answer these inquiries, because the parties write in such indefinite terms. We recommend them to obtain a very cheap work, just issued from our office, entitled, "The Emigrants' Handbook;" which is a guide to the various fields of emigration in all parts of the globe. We recommend this to R. Jamieson, to T. Pranter, to J. F S, &c.

A CONSTANT READER.—We do not pretend to "skill in surgery," nor can we undertake to prescribe for the dropsy.

P SIMPLE.—You had better apply to one of the clerks of the Admiralty Office.

JOHN MAY, W STANWELL.—"The Pathway" will be published, in future, on the first day of every month, instead of fortnightly, as heretofore

MARY A female friend informs us that "flannels may retain a good colour, and be preserved from shrinking," by always putting them into *scalding hot* water instead of water moderately warm, as is the usual practice.

CURIOUS.—*Gold sovereigns*, value 20s, were introduced in the year 1534; in 1550 their value was 21s., in 1562, 30s; in 1821 they were reduced at their present value,—namely, 20s.—*Tea* was first brought into London by the Dutch East India Company, early in the seventeenth century. In 1666 a quantity of it was brought from Holland by Lord Arlington and Lord Ossory From this time it became more generally used, that is, by those who could afford to purchase it, the price then being 60s per pound In 1773 the Americans refused to receive it until the duty on, which occasioned the long civil war

CLASSICUS.—You ought not to assume such high-sounding name till you are at least able to translate the three Latin words you inquire the meaning of. *Fronti nulla fides* means, "There is no faith in appearances." Horace liberal, and the most common interpretation of it is, "All is not gold that glitters."

X. T. W.—The "droits" or "*rights*" of the Admiralty "form a portion of the ancient hereditary revenues of the crown, and arise from the capture of enemies' ships coming into port, ignorant of the commencement of hostilities; also the proceeds of wrecks, property floating on shore, &c.

MARTHA wishes us to inform her whether there is any possibility of rendering rancid butter fit for use. We tell her, in the first place, that rancid butter is not only very unpleasant to the taste, but very unwholesome; and, secondly, that the rancidity will be increased rather than diminished by melting or baking. There is, however,—so we are told by an experienced housekeeper,—a simple process by which it may be purified. Let the butter be melted in a saucepan, as if for clarifying, then put into it a piece of bread thoroughly toasted all over. In a few minutes the butter will lose its offensive taste and smell, which will be communicated to the toast. "But," our informant adds, "be sure you do not give the toast to anybody to eat!"

JACOB JACOBS.—Certainly your "cousin" could "enter an action" against you "for breach of promise of marriage" if you have been guilty of such breach.

THE HOLY LAND.

CALVARY—THE FRANK MOUNTAIN—BETHLEHEM.

THE Church of the Holy Sepulchre, as it is now termed, is situate not far from the north-west corner of Jerusalem, and has gathered round it most of the convents and the principal residences of the professed Christians. Passing the vestibule, the visitor stands under the large central dome, and close to the smaller edifice, which is supposed to cover the Holy Sepulchre itself. The large dome is about seventy feet in diameter, and nearly the same in height; and the surrounding walls are divided, in the usual manner, into three stories. There are eighteen piers, some of which are round pillars, with capitals, bases, and pedestals, and the others simple square piers. The large and lofty piers towards the east, or right hand, sustain a wide arch, which now serves as a passage between the rotunda and the choir, which is in possession of the Greeks. In the intervals between the piers are chapels of very considerable depth.

A house of stone stands over the spot where the Holy Sepulchre is thought to have been. Lamartine describes it as "an oblong square, adorned with pilasters, a cornice, and cupolas all of marble; the whole of a laboured and eccentric design and executed in bad taste." A small, dimly-lighted room serves as an ante-chapel to the sepulchre itself. As now shown, it is a sort of sarcophagus of white marble, which surrounds and conceals from the eye everything relatin

MOUNT MORIAH.

to the tomb, and is about two feet above the level of the floor.

Mount Calvary is about a hundred and twenty feet distant from the site of the sepulchre, in a south-easterly direction, and is reached by a flight of eighteen steps cut in the rock: the elevation is about twenty feet above the floor of the church. Underneath the hill of Calvary is a chapel, with the tombs of Godfrey de Bouillon and his brother Baldwin, but the inscriptions upon them are scarcely legible.

Much dissension has taken place as to the actual site of the event now alluded to; on this subject, Mr. Bartlett says,—"We cannot doubt that the apostles and first Christian converts at Jerusalem, must not only have known the spot, but that this knowledge must have descended to the next generation, even though no peculiar sanctity were by them attributed to it. Soon after the destruction of the city, it is generally supposed that some among them returned to re-establish themselves among its ruins; and it seems almost incredible that they should not have sought for the spot again, and pointed it out to their descendants, as worthy of pious remembrance. Making every allowance for the fact that the first converts were rather absorbed in the spiritual influences of Christianity, than careful about the different sites of its history, we think it must be still conceded, that it is very improbable that the knowledge of those lying immediately around them should entirely die out. The presumption, then, would seem reasonable that the Christians at Jerusalem must have been acquainted with the real Calvary, when Constantine erected the original church of the Holy Sepulchre upon the same site occupied by that now standing."*

To this statement we may add the words of Mr. Fergusson†—"I believe that the boundaries of property were well defined, and registers kept, describing every field and house, and more especially everything in the immediate proximity of the capital of a Roman colony, as Ælia Capitolina was in the time of Constantine; so that I do think it more than probable that he (the emperor) possessed the means of ascertaining the fact beyond doubt; indeed, the narrative of Eusebius seems to presuppose that such information did exist, for there is no doubt or hesitation apparent, either in the mind of the emperor or the historian, as to where the place was. . . Golgotha . . . . must have been at all times one of the best known spots about Jerusalem, and one as likely to have retained its name, in the time of Constantine, as any other,—so much so, that it appears to me almost a work of supererogation to go to the register, or any remote argument, for its fixation, and even supposing all Christian tradition to have been silent, and no registers to have existed, I cannot but think that Constantine might easily have gained the knowledge he sought, of the exact position of that spot, and from that at least known whereabouts the sepulchre stood,—if he could not point out exactly the identical cave in which the body was laid. My own belief is, that he had the means of ascertaining both, but most certainly that of Golgotha."

A visit to the "Frank Mountain" is regarded by travellers as deeply interesting. Passing out of the Jaffa or Bethlehem Gate, descending the hill, and leaving the extensive port of Gihon on the left, the way thither turns towards the south. There is a fine glimpse of the deep valley of Hinnom, with its fertile spots, and pretty garden enclosures, as they ride along the hill-side on the west, and gradually come on the high table-land towards the south. Looking back, the Holy City spreads out before the eyes, in part only, Mount Zion rearing its lofty head, and shutting out from view much that would otherwise be visible. On the left, the hill-sides, terraced, and thus made serviceable for culture, suggest many a thought of the rural life of Judea. The "Mount of Offence" is on the opposite side of the valley, and the "Hill of Evil Counsel" nearer, and to the south of the vale of Hinnom. In general the face of the country about Jerusalem has a hard and almost barren appearance, the rocks in many places are bare, and the soil is for the most part thin and scanty, on the level surface there is earth abounding with loose stones, yet the ground is far from unfruitful, and in spring the waving fields of grain and grass, the groves of olive, the fig-trees, the pomegranates, the pear, and other fruits, not only give token of what the land is capable of producing, but add greatly to the interest and beauty of the scene.

Branching off, soon after leaving the city, rather to the left, and following the sheep or goat paths along the sides of the hills or over the level spots, the traveller soon arrives in the vicinity of the lofty conical hill, which has received the name of Jebel el-Furcidis, Hill of Paradise, or the Frank Mountain, and which, though not very often visited, deserves some notice at least, on account of the remains near its base and on its summit. The ruins near the foot of the mountain are supposed by Dr. Robinson to indicate the site of the Herodium, a large city erected by Herod the Great, of which the hill and fortress constituted the Acropolis. The learned author quotes the account of Josephus in respect to this city, and makes it appear from various particulars, such as the situation, which is about seven miles south of Jerusalem, and not far from Tekoa, the mountain answering to the one of which Josephus speaks, the round towers, the large reservoir of water, and the city below, —that the Frank Mountain and its vicinity were originally occupied by this splendid city and strong fortress. Perhaps it was here, too, that the body of Herod was brought for burial, two hundred stadia from Jericho, where he died. Certainly, even a cursory look at the ruins near the base of the mountain, and the remains on the summit, must strike the attention of every traveller, and force him to the conclusion, that this locality was once deemed of great importance, both as a place of strength, and as a fitting site for a large and beautiful city. Josephus thus speaks of the Herodium.—"An artificial mound, shaped like a woman's breast, distant sixty furlongs from Jerusalem, Herod named similarly and adorned in a more ambitious style. The summit he embraced with circular towers occupying the enclosure with the most sumptuous structures; and not only did the interior of these present an air of magnificence, but on the outer walls also, with the battlements and roofs, was lavished a profusion of costly ornaments. He moreover, conveyed to it, from a great distance, and at an immense expense, an ample supply of water, and rendered the ascent easy, by two hundred steps of the whitest marble, the mound being of considerable elevation and entirely artificial. He erected also, at the base, other palaces for the reception of his furniture and friends; so that the fort, in the diversity of its accommodation, resembled a town—in its circumscribed limits, a royal residence." Irby and Mangles mention the tradition, apparently of recent date, that the Frank Mountain was "maintained by the Franks forty years after the fall of Jerusalem," and the expulsion of the crusaders. They go on, however, to say, that "the place is too small ever to have contained one half the number of men which would have been requisite to make any stand in such a country, and the ruins, though they may be those of a place once defended by Franks, appear to have had an earlier origin, as the architecture seems to be Roman." Maundrell, also, speaks of "a high, sharp hill, called the Mountain of the Franks, because defended by a party of the crusaders forty years after the loss of Jerusalem."

The mountain is lofty, and rises from its base in the shape of almost a perfect cone, truncated, however, at about three-fourths of its height. In many respects the view is fine from the summit of this high hill. To the south and west the prospect is very limited; but looking eastwardly the eyes are greeted with the sight of a considerable portion of the Dead Sea, which lies spread out in all its silent gloom and impressiveness, and seems to harmonize well with the barren, sterile, and as it were tenantless region round about. Dr. Robinson says, that the top of the hill constitutes a circle of about seven hundred and fifty feet in circumference, and that the whole of this is enclosed by the ruined walls of a circular fortress, built of hewn stones of good size, with four massive round towers, standing one at each of the cardinal points. One of the towers—that on the east—is partially remaining, and gives a good idea of the solidity of the structure in its palmy days. Inside of the walls, or ruins, the ground descends rapidly to a considerable depth, not unlike the crater of a volcano. At present it is difficult to tell whether there was formerly an excavation in the enclosure, or whether, in the lapse of time, the ruins may have formed a mound or slight elevation around the

* "Walks about Jerusalem," pp 169, 170

† Fergusson's "Essay on the Ancient Topography of Jerusalem," pp. 85, 86.

former level of the summit; but either way it is of no great consequence.

A recent traveller says,—"We descended the mountain and turned off to the west. For some distance our course was along the hill-sides and through the valleys which abound in this region: a part of our way was through a very deep and very lovely ravine, which was rendered all the more attractive because of the care and skill bestowed upon its cultivation, and the sweet, clear, and babbling brook which flowed through its midst. At all times water is refreshing to the eye as well as to the body, but nowhere does it appear more delightful, nowhere is one more deeply impressed with the value of this greatest of blessings, than here in the east, when suddenly the traveller comes upon the sparkling fountain, or a stream of pure water, gliding along fraught with countless mercies to the sons of men. We saw, at no great distance from the point where we first met with this beautiful rivulet, the remains of a large reservoir, and a number of women were occupied in washing of clothes by the water's edge. I was much gratified by the kind and cheerful manner with which they brought and offered to us water to drink out of their earthen jars, an offering the most acceptable which just then we could have received, since we had not tasted a drop from the time that we had left Jerusalem unto the present moment, owing to the carelessness of our dragoman, who had forgotten to bring it with him for our expedition. I may take occasion here, inappropriate, and certainly deeply fixed in my memory am[illegible] of want of a draught of water for several hours, to warn the traveller in these hot climates, especially to make provision for a supply of water wherever he goes, that he may not imprudently drink, when he is heated, the cold water out of the deep cisterns sometimes found by the road-side, and may not be compelled to ride or walk for hours exposed to the hot sun without a supply of this necessary and refreshing element.

"About half-past two, having traversed a narrow, stony valley, we came to those vast receptacles for water, commonly known as 'Solomon's Pools.' We had been riding for some little time by the side of, and over the aqueduct which carries the water from the pools to Bethlehem, and so on to the great mosque built on the site of the temple in Jerusalem. There were evident traces of antiquity about the aqueduct, and in several places it was much out of repair; nevertheless, it was not difficult to see and feel its importance not only to Bethlehem, but to the Holy City itself. The pools of Solomon are really grand and striking from their extent and their great antiquity, and they are worthy his distinguished wisdom and the glory of his reign. Fancy to yourself three immense reservoirs, built with great care, of solid masonry, and in close proximity to one another. Being constructed on the steep sides of the valley, they rise one above the other, but not in a direct line, toward the top of the hill, so that in fact the bottom of the middle is higher than the top of the lower pool, and the bottom of the upper higher than the top of the middle pool, there is, too, between them a distance of from about two hundred to two hundred and fifty feet. At the time we were there, the lower and middle pools had not much water in them, in the case of the former hardly sufficient to cover one half of the broad bottom; the upper pool seemed to be about one-third full, and the water was probably about ten feet deep. It was certainly a peculiarity worth noticing, that the sides of the reservoirs were covered and made smooth with cement; the bottom was partly of the rocks in their natural state; and in several places there were flights of steps which led down into the pools when the water chanced to be low. The source whence these reservoirs were supplied, is a sunken fountain situate in the high ground, about three hundred feet to the north-west of the pools. Maundrell, in 1697, visited this fountain, and took some pains to examine it. Perhaps I cannot do better than quote his judicious and accurate remarks, which will serve as a fitting conclusion to all that need here be said of Solomon's Pools. He informs us that the waters 'rise under ground, and have no avenue to them but by a little hole like to the mouth of a narrow well. Through this hole you descend directly down, but not without some difficulty, for about four yards, and then arrive in a vaulted room fifteen paces long and eight broad. Joining to this is another room of the same fashion, but somewhat less. Both these rooms are covered with handsome stone arches, very ancient, and perhaps the work of Solomon himself. You find here four places at which the water rises. From these separate sources it is conveyed by little rivulets into a kind of basin; and from thence is carried by a large subterraneous passage down into the pools. In the way, before it arrives at the pools, there is an aqueduct of brick pipes, which receives part of the stream, and carries it by many turnings and windings about the mountains, to Jerusalem.'

"It was getting late in the [illegible] when we arrived in the vicinity of Bethlehem, on our road homeward to the Holy City; and as it was necessary to reach Jerusalem before sunset, at which time the gates are closed, and no strangers permitted to enter, we gave little heed to most of the merely traditionary localities in and about the town, and devoted our time and attention principally to those which have strong claims on the confidence and sympathies of the Christian. We rode through a part of the town, and proceeded at once to the large and rather imposing church built over the place of our Lord's nativity. It is directly by the side of and connected with the extensive convent at Bethlehem, which is occupied by the Greeks, Latins, and Armenians, who, so far as I know, live together in greater harmony than unhappily is the case in Jerusalem. Passing through a very low and narrow portal, we entered the spacious church, walked slowly forwards towards the eastern end, where mass was being performed, and followed our guide to the spot where tradition attests that our blessed Saviour was born. To one unaccustomed to the singularly ill-judged and tasteless manner in which holy places have been overladen with ornaments, the grotto of the nativity would appear to have small claims on the attention. I confess, that not only here, but almost everywhere in the Holy Land, there is much, far too much, which annoys the traveller, and sometimes urges him to the conviction that none of the traditions in favour of particular localities have any great value or importance. The strong desire—in former days amounting almost to a passion—for building churches and erecting altars over sacred and revered spots, as well as for encasing in marble and precious metals, and loading with profuse decorations, some holy grotto or some sacred tomb of saint or martyr, has done injury in more ways than one to the cause of truth, but principally by tending to confound, one with another, those places which are probably, or almost certainly, the localities which they profess to be, and those for which naught can be urged, except very recent, contradictory and baseless traditions. This is deeply to be regretted, and not a little adds to the perplexities of the enlightened pilgrim who desires to discriminate rightly, and is laudably anxious, while rejecting those stories which have manifestly no foundation, and have arisen out of the fond desire of the human mind to fix a visible site to every scripture event, not to run into the dangerous extreme of doubting everything or believing nothing, which ancient tradition has handed down even to our own days." With such feelings, it is almost painful to descend a number of marble steps into a small dimly lighted chapel, to see the spot pointed out as the place of the nativity, covered with all kinds of ornaments, and resorted to by devotees from all quarters, with prostrations, kissings, and adoration, amounting, it would appear, very near to absolute idolatry; to look upon a marble manger in which, it is said, the Holy Babe was laid, but which has the evident marks of modern origin, and to stand in or near a place which is probably the place where the Virgin Mother brought forth her first-born son, wrapped him in swaddling clothes, and laid him in a manger.

How many ages back does the history of Bethlehem extend, and with what a multitude of illustrious characters and events has it been connected! It was here that Jacob came, with all his wealth, which God had given him, with his wives and children, strangers in the land which was promised to them and their seed as a sure possession. It was here that his beloved wife, for whom he had served fourteen years, which "seemed unto him but a few days for the love he had to her," was taken away from him, leaving with the mourning father the infant Benjamin as a precious pledge of her last hour: here, too, not far from the town, she was buried, and the place of her sepulture remains even unto this day. More than four hundred years afterwards, "it came to pass that all the city was moved" by the arrival of Naomi and the gentle, lovely,

and most affectionate Ruth. Here was the scene of those events, so touchingly related in the book of Ruth; and here did it happen that the poor and widowed Moabitess became the wife of the wealthy and honoured Boaz, and the great-grandmother of Israel's second and worthiest king. This was the city of David the servant of the Lord, whom he "chose and took from the sheepfolds; from following the ewes great with young, he brought him to feed Jacob his people and Israel his inheritance. And David fed them according to the integrity of his heart, and guided them by the skilfulness of his hands."* A thousand years and more passed away, and Bethlehem was visited by one of Ruth's descendants, and one more highly favoured and honoured than any of her sex. The blessed Virgin Mary came from Nazareth to her own city, the city of David, to be taxed according to the decree of the Emperor Augustus; and here

ENVIRONS OF JERUSALEM.

she dwelt till "the days were accomplished that she should be delivered." Here Christ Jesus was born, the Saviour of the world, the Desire of all nations, the long-expected Messiah, here our Lord and our God "took not on him the nature of angels, but He took on Him the seed of Abraham,"† and was "a light to lighten the Gentiles, and the glory of the people Israel.‡ Not far from this highly honoured city, abiding in the field, were shepherds keeping watch over their flock by night; and when that scene of glory occurred, of which the Evangelist speaks. Bright were the stars which in their courses roll; brilliant were the heavens as these simple shepherds gazed upon them; but surpassingly magnificent was that glory of the Lord which shone round about them, as with fear and trembling they prostrated themselves in adoration before the throne of God. And what a message of love and mercy was that which they heard! "Fear not, said the angel, for behold I bring you good tidings of great joy, which shall be to all people. For unto you is born this day in the city of David a Saviour, which is Christ the Lord. And this shall be a sign unto you; ye shall find the Babe wrapped in swaddling clothes, lying in a manger."* What celestial harmony was that which their ears were permitted to listen to! for "suddenly there was with the angel a multitude of the heavenly host, praising God, and saying, Glory to God in the highest, on earth peace, good-will towards men." Ah, with what alacrity did they go even unto Bethlehem, to see that thing which was to come to pass, which the Lord had made known unto them; and when they had seen the Holy Child and the virgin mother, as it had been told them by the angel, with what joy and confiding faith did they spread abroad the good news of God's infinite compassion to our race in sending his Son, his only Son, into the world! Here, too, did the star of Bethlehem shine with a lustre all its own, that star which had been the guide of so many days and on so long a journey of the illustrious sages of the East: and these wise men followed its guidance till it came and stood over where the young Child was. with what exceeding great joy did they enter the house; with what unhesitating faith did they worship the infant Saviour, and with what gladness did they open their treasures, and as kings unto the King of kings did they present unto him gifts, gold, and frankincense, and myrrh; and when they had gone away, rejoicing, unto their own homes, alas what a terrible blow fell upon Bethlehem! God had sent away into Egypt both Joseph and the young

* Ps lxxviii. 70—72. † Heb. ii. 16. ‡ Luke ii. 32.

* Luke ii. 10—12

Child and his mother, when the bloody tyrant Herod, even now on the brink of the grave, frustrated in his designs upon the life of the Holy Child, sent his ruffian band to slaughter the innocent babes of Bethlehem, and of all the coasts thereof. It was a deed of horror, unsurpassed by ought of sanguinary ferocity in that despot's latter years; and might well lead the Evangelist to adopt the striking figure of the prophet Jeremiah; "in Ramah was there a voice heard, lamentation and weeping, and great mourning, Rachel weeping for her children, and would not be comforted, because they are not." *

SIR FRANCIS CHANTREY, R.A.

FRANCIS CHANTREY was a poor boy. His father rented a small farm at Jordanthorpe, near Sheffield, and died when his son was only twelve years of age The widow, in the first year of her bereavement, married again, taking unto herself as her husband—much to the disgust of her son, who would never call his mother by the name she had acquired on her second marriage—a farm servant of her own, by name Job Hall Francis, after the manner of step-sons, was quickly placed in a grocer's shop in Sheffield, but after a few weeks' misery behind the counter he was removed, at his own earnest request, and apprenticed to "Robert Ramsay, of Sheffield, in the county of York, carver and gilder," the contents of whose shop-window had caught the eye of the grocer's boy and communicated, as is the wont of such instruments, potently and mysteriously with his genius Ten pounds were paid at the binding, and the apprenticeship was for a long seven years The date of the indenture is Sept 19, 1797, when Chantrey was sixteen years old.

Mr Ramsay, besides being a carver in wood, was also a dealer in prints and plaster models Chantrey at once set about imitating both He began to work the moment he set foot in the carver's shop, and he ceased his labours only when he died In a former brief notice of his character we have called attention to the thoroughly English qualities in virtue of which Chantrey won his way to renown. His example is valuable chiefly in this regard. His patience, industry, and steady perseverance achieved everything for him that he subsequently won. His biographers (Mr. Holland as well as Mr Jones) place Chantrey upon a pedestal somewhat too high for his deserts We presume the amiable fault is inevitable in all biographical attempts The hero must transcend all former heroes, or the scribe is at fault But, in truth, there is no occasion to demand for Chantrey more than he may lawfully aspire to His countrymen are not slow to recognise claims so valid and so well understood Chantrey's genius was not overwhelming or astonishing, his compositions had nothing in them of high imagination and of strictly-called poetic elevation. But for simplicity, beauty, and truth, his works are not to be surpassed, and they evoke admiration and applause as the undoubted, though unpretending, triumphs of a gifted mind well disciplined in the school from which no genius, however lofty, can skulk without peril of misadventure In Ramsay's shop Chantrey copied the prints, worked at the carvings, cleaned pictures, and tried his 'prentice hand as a modeller, upon the face of a fellow-workman He did more At a trifling expense he hired a small room, to which he retired to spend every hour he could call his own in modelling and drawing "It was often midnight," writes Mr Holland, "before he came home, but neither master nor servant ever suspected he had been anywhere but in his obscure studio, drawing, modelling, or poring over anatomical plates." He was still an apprentice when he made the acquaintance of Jonathan Wilson, the medal engraver. In the old High-street of Sheffield was a low gloomy shop, called "Woollen's Circulating Library" "In a back chamber of these premises," Mr. Holland informs us, "might by night, towards the close of his apprenticeship, did young Chantrey and his friend Wilson devote themselves to the pencil, their principal exercise being to copy the drapery of a series of French prints of statuary." Subsequently, meeting Mr Raphael Smith, "the distinguished draughtsman in crayon," at his master's house, and growing impatient of wood carving, Chantrey induced Mr. Ramsay to cancel his indentures two years before his term of apprenticeship expired. A friend advanced £50 to effect his release, and freedom being obtained, Chantrey, then in his 21st year, made the best of his way to London. Reaching that scene of his future greatness, he called immediately upon an uncle and aunt, both living in the service of Mrs. D'Oyley, in Curzon-street, Mayfair, and that lady, much to her credit, gave the young artist a room over her stable to work in, and requested his uncle to see him daily supplied with a necessary knife and fork.

At Mrs D'Oyley's Chantrey was still a man of all work, cleaning the pictures in that lady's house, and occupying himself now with painting and now with sculpture, yet doubtful as to which pursuit he should finally and exclusively devote his powers. A very few months after taking up his residence in Mayfair we find the active youth back in Sheffield upon a flying professional visit, making the most of his advantages at this as at every later period of his life

Chantrey married and received substantial coin with his wife. Mrs. D'Oyley's butler was comfortably warm in respect to things of this life, and when he gave his daughter to his nephew, he added a sum sufficient to enable the latter to build himself a studio, and to take a position worthy of his prospects. From first to last Chantrey received of his wife's money considerably more than £10,000; and of all artists that ever lived Chantrey knew best how to turn such gifts of fortune to good account

Francis Chantrey, like Byron, rose one morning and found himself famous In the year 1811 he had six busts in the Exhibition, and one of these was the head of Horne Tooke, which brought commissions, according to Chantrey's own account, amounting to £12,000. It is very likely that with this enormous success, acquired through the instrumentality of the radical philologer, Chantrey's own radicalism began to decline. The sculptor was a furious democrat in his early struggles, sneered at the reigning family, and roared for Sir Francis Burdett As he invested his thousands in 3 per Cents. the respectability of existing institutions visibly increased A more gentlemanly old Tory never lived than Chantrey at the age of sixty

In 1811, over fifteen competitors, Chantrey was selected to execute a statue of George III for the city of London. From that year until 1817 he commanded in his profession By universal consent, he was allowed to be unequalled in his time as a modeller of busts, and nothing, indeed, can surpass the force, the truthfulness, and simplicity of these works In 1817 he was elected an associate of the Royal Academy, and executed the exquisite monument of "The Sleeping Children," now in Lichfield cathedral. Mr Holland is very much distressed because it has been contended that the sole merit of the design of this monument does not rest with Francis Chantrey, and he takes infinite pains to prove the contrary. Mr Holland, however, might have spared his indignation and his trouble There is no doubt that Stothard's pencil gave Chantrey the original sketch for this lovely work of art, the sketch is in existence, and will, we believe, be shortly published in Stothard's life. It is equally certain that the snowdrops placed in the hands of the younger sister were a poetic and affecting suggestion of Allan Cunningham But what then? Look at Stothard's drawing, and compare it with the grace, feeling, and irresistible beauty of the sculptured monument It matters little who designed the sketch, while the marble remains to attest to the power, perception, and matchless skill of the mind that gave it glowing life No eye that has ever gazed upon those artless forms has cared to look beyond them or to inquire too curiously into their origin They speak, silently sleeping, sufficiently for their creator What sculptor of Chantrey's day could have wrought such work had the whole Academy combined to furnish him with a subject?

From 1817 until his sudden death in 1841 Chantrey's career was one of wonderfully profitable occupation and accumulating triumphs. Four monarchs sat to him, and the list of remarkable persons whose faces he perpetuated in marble is much too long to be enumerated here. The last bust on which Chantrey wrought with his whole spirit, and the last which he touched with the chisel, was that of Queen Victoria, now at Windsor, justly regarded by Prince Albert as the best existing bust of Her Majesty The last bust modelled by Chantrey was that of Lord Melbourne, but upon this the sculptor laboured with his own hand very little indeed His strength was failing him at the time, and the noble sitter was himself suffering from ill-health. Indeed, there is reason to believe that while Lord Melbourne would invariably quit the studio in Eccleston-street with a sad conviction of the sculptor's waning faculties, Chantrey himself would at the same time commiseratingly deplore to his friends the visible decline of a statesman's once clear and active intellect Neither suspected his own trouble, but both regarded the other as passing rapidly into a state of hopeless mental decrepitude.

Chantrey had a dread of modelling horses, and made more of one horse than Ducrow ever made out of his whole stud. The first "horse commission" was the George IV. for the marble arch, the second, Sir Thomas Munro, for Madras, third, the Duke of Wellington, for the city. Of these, unquestionably the

* Matt. ii. 18; Jer. xxxi. 15.

finest is the Munro; but all the horses are from the same model. In the first two no difference whatever is made in the animals; in the Duke of Wellington's case the head of the horse is altered, but in other respects the steed is that mounted by Sir Thomas and the King, and no other. For George IV. Chantrey received £9,000, and profited £3,000; for Munro, he was paid £7,000, and profited as much; for the Duke of Wellington his charge was £10,000, and by this he must have gained at least £5,000. In his later years the sculptor became greedy of commissions and money, and anxious to secure everything. He was eager for the Wilkie statue, and eagerer still for the Glasgow Wellington statue; but the Glasgow people, having a laudable fear of the old horse took refuge in Marochetti.

These, and other points to which reference is made in Mr Holland's book, are of interest in estimating the character and claims of Francis Chantrey. It is worthy to be noted—for, certainly the discovery would never be made by an inspection of his works—that Chantrey's vision was very imperfect. Of the right eye he had no use whatever, yet he was an excellent shot. Of reading, he had none. His education had been of the very humblest, yet no one would have accused him of ignorance on any matter. He had surprising tact, a singular faculty of observation, admirable facility of acquiring knowledge in his daily walks, and perfect skill in concealing his poverty. He was brought up, the son of a working man, first in a poor cottage, then in a carver's shop, but he was at ease in the society of princes, and his manner was as far removed from obsequious flattery as from vulgar rudeness. He had a fine and frank independence which endeared him to his inferiors, and gave dignity to his professional character in the eyes of those above him.

It will hardly be said that Chantrey during the whole of his professional and highly "respectable" life was disposed to disturb the many useful institutions of his country, but one very important institution he failed to support by any extensive personal co-operation. It is a fact, that except to be married, or to put up a monument, Chantrey never was inside a church in his life. Mr. Holland complains that Mr Jones in his "Recollections" has made no mention of Chantrey's visits to a place of worship, but we confess that this is somewhat hard upon Jones, who has made mistakes enough, as we all know, without being forced into others against his will. If any one is to be blamed for Jones's silence in this respect it is certainly not the biographer; and Mr Holland would seem to be of that opinion when he very properly vindicates the character of Bacon, the sculptor, and shows how a man may humbly fulfil the duties of a Christian.

In his will Chantrey provided that the whole of his large fortune, amounting, we believe, to £90,000, should, at the decease of his widow, become the property of the Royal Academy, for the purpose of purchasing "works of fine art of the highest merit in painting and sculpture," but only such as shall have been entirely executed "within the shores of Great Britain," the "wish and intention" of the artist being "that the works of art so purchased shall be collected for the purpose of forming and establishing a public national collection of British art in painting and sculpture." One or two minor bequests are of a curious nature. As a mark of his regard for the long services of his old lieutenant, Allan Cunningham, Chantrey stipulated in his will that the latter should be entitled to receive a legacy of £2,000 upon his superintending the completion of the Wellington statue. Allan attended to the important work up to the day of his death, but he died before the statue was completed, and—whatever may have been the intentions of the testator—his family lost the money. Another bequest was a gift of £50 per annum, "to be paid to a schoolmaster, under the direction of the vicar or resident clergyman, to instruct ten poor boys of the parish of Norton without expense to their parents;" but the condition of the legacy was the perpetuation of the donor's tomb. Mr. Holland gives no explanation of this somewhat unusual proviso, but it is worth recording, nevertheless. Many years before his decease, Chantrey attended at St Martin's-in-the Fields, with a friend, the funeral of Scott, who was shot in the duel with Christie. The graveyard was strewed with human bones, and the gravedigger was adding indiscriminately and irreverently to the heaps. Chantrey inquired of the sexton what eventually became of those last remains of mortality. The sexton replied, with a smile, that when they grew too plentiful they were carted off in loads to the Thames. The friend described the effect of this answer upon the frame of Chantrey as painful in the extreme. His cheeks grew sickly white, and perspiration poured down them. At the moment he looked himself a corpse newly risen from the grave before him. "I will take care," he said with a shudder, "that they do not cart my bones to the Thames. They shall be undisturbed under my native sod." And, accordingly, there are five pounds per annum for ten poor boys of the village of Norton, so long as they will remember industriously to pluck the weeds and to remove the nettles that deface the gravestone of Francis Chantrey. The sculptor subsequently paid a formal visit to Norton, and carefully selected the spot for his last resting-place. While looking for it he encountered the gravedigger, who approached him, mattock on shoulder; "I am looking out a place for a grave," said Chantrey, "but I don't mean you to dig it." "I hope I shall," replied the gravedigger quietly and civilly. And it is likely enough that he did, for within a year the renowned sculptor was deposited near the humbler family dust that had mingled with the earth before him.

THE LIBRARIES OF EUROPE.

Of the importance of laying open to the people the great treasures of literature there can be now no question. Dr. Johnson being once asked how he would educate a boy, replied, "Turn him loose in a library." This, though very good advice as far as it goes, would not meet the requirements of youth, whose energies require to be directed. A well-selected library of choice works, rather than abundance of books, is the great want of cities. In London there are many private libraries, but not one really public. We, who profess never to do things by halves, have never, in fact, instituted *free* libraries. The British Museum library is only open to a comparative few, who have to read the books on the spot; the large University Libraries cannot be said to be free, even to the students; and, with the exception of the Humphrey Chetham Library at Manchester, there is really no *free* library in Great Britain. On the continent there are many free libraries. In France there are 117; in Prussia, 44; in Austria, including Venice and Lombardy, 48; in Bavaria, 17; in Belgium, 14; in Saxony, 6; in Tuscany, 6; in Denmark, 5. The various European capitals have free libraries for the use of all classes. Paris has 7; Florence, 6; Dresden, 4; Vienna, 3; Copenhagen, 2; Brussels, 2; Berlin, 2; Milan, 2; Munich, 2; while in the great city of London the student and man of letters has free access to only one, and that one so arranged, that all reference to books published within three years of the present time, and access to all rare and curious MSS., is practically denied to the great mass of the readers.

The oldest of the European libraries of printed books is probably that of Vienna, which dates from 1440, and is said to have been opened to the public as early as 1575. The Town Library of Ratisbon dates from 1430; St. Mark's Library at Venice from 1468; the Town Library at Frankfort from 1484; that of Hamburg from 1529; of Strasburg from 1531; of Augsburg from 1537; those of Berne and Geneva from 1550; that of Basel from 1564.

The Royal Library of Copenhagen was founded about 1550. In 1671 it possessed 10,000 volumes; in 1748 about 65,000; in 1778, 100,000; in 1820, 300,000; and it now contains 412,000 volumes. The National Library of Paris was founded in 1596, but was not made public until 1737. In 1640 it contained about 17,000 volumes; in 1684, 50,000; in 1775, 150,000; in 1790, 200,000. It now possesses at least 824,000 volumes. The library of the British Museum was founded in 1753, and was opened to the public in 1757, with about 40,000 volumes. In 1800 it contained about 65,000 volumes; in 1823, 135,000; in 1836, nearly 240,000; and it now contains 435,000 volumes. But it must not be inferred that the whole of this difference, between 1836 and 1848, arises from the actual increase of the collection; on the contrary, a portion of the apparent increase results from the circumstance that many thousands of tracts, formerly in volumes or cases, have been separately bound, and are now enumerated as distinct volumes.

The steady growth of the Copenhagen library has been mainly owing to judicious purchases at favourable opportunities. The rapid increase of the magnificent National Library of Paris, since 1790, is in a great measure to be ascribed to the revolution; the suppression of the monasteries and convents, and the confiscation of the property of rebels and emigrants, having placed many fine libraries at the disposal of the ruling powers of the day. And although, in some cases, large numbers of books and MSS. appear to have been summarily disposed of, "for the service of the arsenals," more usually special instructions were given that the officers at the head of the National Library should have an unlimited power

of selection; and of this they made extensive use. The increase of the British Museum library, on the other hand, is mainly ascribable to donation. Of its 436,000 volumes, at least 200,000 have been presented or bequeathed. The National Libraries of Paris and Madrid, the Royal Libraries of Munich, Berlin, Copenhagen, Vienna, Naples, Brussels, and the Hague, the Brera Library at Milan, the Magliabecchian at Florence, and the ducal library of Parma, together with the library of the British Museum, are entitled by law to a copy of every book published within the states to which they respectively belong.

If the principal libraries in the several capital cities of Europe be arranged according to their respective magnitudes, they will stand in the following order:—

Paris (1) National Library	824,000	vols.
Munich, Royal Library	600,000	,,
Petersburg, Imperial Library	416,000	,,
London, British Museum Library	435,000	,,
Copenhagen, Royal Library	412,000	,,
Berlin, Royal Library	410,000	,,
Vienna, Imperial Library	313,000	,,
Dresden, Royal Library	300,000	,,
Madrid, National Library	200,000	,,
Wolfenbuttel, Ducal Library	200,000	,,
Stuttgard, Royal Library	187,000	,,
Paris (2), Arsenal Library	180,000	,,
Milan, Brera Library	170,000	,,
Paris (3), St. Genevieve Library	150,000	,,
Darmstadt, Grand Ducal Library	150,000	,,
Florence, Magliabecchian Library	150,000	,,
Naples, Royal Library	150,000	,,
Brussels, Royal Library	133,500	,,
Rome (1), Casanate Library	120,000	,,
Hague, Royal Library	100,000	,,
Paris (4), Mazarine Library	100,000	,,
Rome (2), Vatican Library	100,000	,,
Parma, Ducal Library	100,000	,,

The average annual sum allotted to the support of the national library at Paris is £16,575; to that of the Royal Library at Brussels, £2,700, to that of Munich, about £2,000; to that of Vienna, £1,900; to that of Berlin, £3,745; to that of Copenhagen, £1,250, to that of Dresden, £500, to that of the Grand Ducal Library of Darmstadt, £2,000.

For a long period prior to the report of the Select Committee of the House of Commons on the British Museum of 1835-36, the average annual expenditure for the library of the Museum was under £8,000 a year, and of this sum only £1,135, on an average, were expended on the purchase of printed books. From 1837 to 1845 inclusive, the sum devoted to the last-named purpose was, on the average, £3,443. In 1846 and 1847, an annual sum of £10,000 was thus appropriated, by a special increase of the parliamentary grant, urgent representations having been made to the Treasury of the great deficiencies existing in the collection of printed books. In 1848, however, this grant was reduced to £8,500, and the sum voted for 1849 was but £5,000. The entire annual amount at present allotted to the service of the library, in all its departments, is £23,261; *viz.*, for salaries in the department of MSS., £2,169, in that of printed books, £7,122; and in the reading-room, £904. For purchases in the department of MSS, £1,823, and in that of printed books, £5,000; for bookbinding, £3,500; for printing catalogues, £873; and for proportion of the expense of secretary's department and of ordinary house expenditure, &c., about £1,870.

The aggregate of the sums expended in the purchase of printed books, including maps and musical works, for the British Museum, from its foundation in the year 1753, to Christmas, 1847, is £102,446 18s. 5d., and that expended in the purchase of manuscripts, £42,940 11s. 10d., together, £145,387 10s. 3d. The sums expended during the same period in prints and drawings amount to £29,318 4s.; in antiquities, coins and medals, to £125,257 0s. 9d.; and in specimens of natural history, in all its branches, to £43,599 7s. 8d.

The present average number of volumes annually added to the National Library of Paris is stated to be 12,000; to that of Munich, 10,000; to that of Berlin, 5,000; to that of Vienna, 5,000; to that of Petersburg, 2,000; to the Ducal Library of Parma, 1,800; to the Royal Library of Copenhagen, 1,000. The average annual addition to the library of the British Museum has been, under the operation of the special grant, about 30,000 volumes, usually comprising about 24,000 separate works.

This number is made up of three distinct items,—namely, purchases, donations, copyright-tax, the relative proportions of which may be estimated from the following tabular statement:—

In the Year	By Purchase. Separate Works	By Donation. Separate Works.	By Copyright Separate Works.	Estimated Total No of Volumes added.	Expenditure.
1841....	3,140	236	2,409	9,193	£3,000
1842....	3,627	926	2,381	10,421	3,000
1843....	4,856	250	2,816	12,387	4,000
1844....	5,475	653	3,929	16 325	4,500
1845....	7,630	881	3,596	13,174	4.500
1846....	18,787	16,377	4,073	53,422	8,909
1847....	15,711	1,806	4,168	36,271	9,941
1848....	15,382	1,275	4,015	23,213	8,572
Totals..	74,608	22,404	27,387	174,409	£46,422

The principal University Libraries may be placed in the following order.—

Gottingen, University Library	360,000	vols.
Breslau, University Library	250,000	,,
Oxford, Bodleian Library	220,000	,,
Tubingen, University Library	200,000	,,
Munich, University Library	200,000	,,
Heidelberg, University Library	200,000	,,
Cambridge, Public Library	166,724	,,
Bologna, University Library	150,000	,,
Prague, University Library	130,000	,,
Vienna, University Library	115,000	,,
Leipsic, University Library	112,000	,,
Copenhagen, University Library	110,000	,,
Turin, University Library	110,000	,,
Louvain, University Library	105,000	,,
Dublin, Trinity College Library	104,239	,,
Upsal, University Library	100,000	,,
Erlangen, University Library	100,000	,,
Edinburgh, University Library	90,854	,,

The University Library of Turin dates from 1436, that of Cambridge from 1484, that of Leipsic from 1544, that of Edinburgh from 1582, the Bodleian from 1597. The small library of the University of Salamanca is said to have been founded in 1215.

The Gottingen, Prague, Turin, and Upsal Libraries are lending libraries. Those of Gottingen, Oxford, Prague, Cambridge, Dublin, and Turin, are legally entitled to copies of all works published within the states to which they respectively belong.

The annual expenditure of the Tubingen library is about £760; of the Gottingen library, £730; of the Breslau library, about £400. That of the Bodleian, at Oxford, is now about £4,000; of which sum £1,375 is defrayed by proceeds of various benefactions; about £650 by matriculation fees, and about £1,500 by "library dues."

There is no public lending library in London. The "London library," in St. James's-square, is, however, an evidence of the utility of such a library, even when the privilege is a purchaseable one. Attached to the various mechanics' and literary institutions are several extensive libraries; but it is to be feared that the majority of the books are novels and similar comparatively worthless works.

THE GREAT LAWSUIT BETWEEN THE TALBOTS AND THE BERKELEYS.—The longest lawsuit ever heard of in England was that between the heirs of Sir Thomas Talbot, Viscount Lisle, on the one part, and the heirs of Lord Berkeley on the other, respecting certain possessions not far from Wotton-under-Edge, in the county of Gloucester. It commenced at the end of the reign of Edward IV, and was depending till the year of James I, when a compromise took place—120 years' litigation. The original disputants were Thomas Lord L'Isle and William Lord Berkeley, and in their age the decision of the sword being more regarded than the authority of law, the two noblemen, with their followers, met in deadly encounter at Wotton-under-Edge, in 1469, when Lord L'Isle received a mortal wound from an arrow shot through his mouth.

JAMES FENIMORE COOPER.

SCARCELY two centuries have elapsed since a small party of English emigrants, flying from religious despotism at home, landed at Plymouth Rock, in North America; and the state founded by this handful of daring and devoted men has become one of the greatest on the earth. Two centuries have sufficed to form a gigantic republic. The American people, which has been well called a Hercules in the cradle, although giving every evidence of commercial greatness, has yet been but poorly represented in the world of letters; for a long period almost all works written on American soil were but imitations of various great novelists then in note in Europe, and bore the stamp of inferiority which attaches itself to imitation.

Among the numbers of native American writers, there are but few who have excited any attention in Europe; but these have brought with them a freshness and novelty, a spirit of nature, and a reflection of the majestic grandeur of American scenery, which at once placed them in the first rank. The names of Washington Irving, Longfellow, Bancroft, Hawthorne, Willis, and Fenimore Cooper, are well and favourably known to all English readers.

Cooper has, with some justice, been called the American Walter Scott; at all events he is undoubtedly the first of American novelists. In a country of comparatively but recent cultivation there can be no historical traditions, no monuments of bygone times, to impress the popular mind with feelings of reverence or admiration; and Cooper, therefore, wisely devoted himself to the delineation of American life in all its phases, after an unsuccessful attempt in the usual path of European novelists. He was most happy in his descriptions of American scenery; of the primeval forests and inland seas; and the great two epochs of American history—the struggle between the savages and the first settlers, and the War of Independence.

James Fenimore Cooper belonged to one of the oldest families in Pennsylvania, which had emigrated in 1679 from Buckinghamshire. His father, Judge William Cooper, settled at Burlington in New Jersey, and was elected to the colonial legislature in 1681. When William Penn founded the state of Pennsylvania, Cooper the elder obtained from him a large grant of land, which has since that time borne his name. Fenimore Cooper was born on September 15, 1789, at Burlington, where his father was state-judge. He spent the first years of his life near the sources of the Susquehanna, in the then insignificant Cooperstown, which he describes with such vigour in the commencement of "The Pioneers."

He was educated at Burlington, at Newhaven, and lastly at Yale College, at which latter place he is said to have diligently

JAMES FENIMORE COOPER.

studied for three years. In his sixteenth year he entered the navy, in which he remained till 1811. This portion of his life has had much influence in giving a character of originality to his writings. Obliged by the state of his health to abandon the navy, he retired into private life, married a Miss de Lancey, sister of bishop de Lancey, of the western diocese of New York, and devoted himself entirely to the pursuit of letters, only interrupting the regular appearance of his works by several trips to Europe, and a long stay at Lyons, where, during the years 1826 to 1829, he filled the office of United States' consul.

His first novel, entitled "Precaution," published in 1821, was but partially successful in America, and is almost unknown in Europe. His second attempt was in another vein, leaving the beaten track of everyday English life, he struck into the American forests, and unfolded an entirely new and interesting world to his readers. This work was "The Spy: a Tale of the Neutral Ground." "So little, however," he tells us, "was expected from the publication of an original work of this description, that the first volume was printed several months before the author felt a sufficient inducement to write a line of the second. Should chance," he adds, writing in 1831, "throw a copy of this prefatory notice into the hands of an American twenty years hence, he will smile to think that a countryman hesitated to complete a work so far advanced, merely because the disposition of his country to read a book that treated of its own familiar interests was distrusted." "Lionel Lincoln; or, the Leaguers of Boston," published in 1824, in which the events of the war of independence form the staple, is, like "The Spy," a work of sterling interest.

Cooper's greatest triumphs were, however, in his later works, descriptive of Indian life, and in some of his naval stories. His next work was "The Pilot," in 1824, and may be well considered as one of his best and most successful novels. The following is a list of Cooper's other novels in the order in which they appeared:—"The Last of the Mohicans"—"The Prairie"—"The Red Rover"—"The Wept of Wish-ton-wish"—"The Water Witch"—"The Bravo"—"The Heidenmauer"—"Homeward Bound"—"The Pathfinder"—"Mercedes of Castile"—"The Deerslayer"—"The Two Admirals"—"Wing and wing"—"Wyandotte"—"Autobiography of a Pocket-handkerchief"—"Ned Myers"—"Ashore and Afloat"—"Miles Wallingford"—"Satanstoe" "The Redskins"—"The Crater" "The Beehunter"—"Jack Tier" "The Sea Lions"—"The Ways of the Hour," which last work appeared in 1850.

Cooper's stories are distinguished by an open, free style, and the delicate manner in which abuses are exposed. We might perhaps desire more animation, more colour, in some of his heroines, but there is a gentle and devoted spirit in all, which makes up for what they lose in brilliancy. Narrah-Mattah is a beautiful instance, in "The Pioneers." Independently of these works of fiction, Cooper published several other writings, particularly his letters on the United States of America, and an account of his travels, which are, however, by no means free from prejudice and misconceptions of the older continent. His letters on the United States were, however, extremely brilliant, and excited great attention at the time.

Of Cooper's merits as a novelist there can be no question, though he was far more at home in the wild prairie, or the wilder sea, than when, as in his late works, he mixed in the commonplace world, and diluted his writings with political or polemical disquisitions. His earlier novels will be read as long as the English language exists, for there is character, freshness, and charm about them, equal, in their way, to anything which has ever appeared. Who, for instance, can forget that most original character, with many aliases, Leatherstocking, or fail to be interested in the sayings and doings of Long Tom Coffin, or cease to sympathise, with the poor, imbecile Hetty Hunter, in "The Deerslayer"? With the history of the lost tribes of America the name of Fenimore Cooper has become so thoroughly identified, that future writers, when they would know anything of "the painted chiefs with pointed spears," as Longfellow happily styles them, must needs refer to the novels of which Cooper is the author, so felicitously has he brought them before the eye and imagination of the reader, and so minutely has he traced their manners, habits, and prejudices. The genius of his youth, though it was often sadly and sorely tried, never departed from him but with life itself; and, however much he wandered from the old track, he no sooner stepped back into it than the charm returned, and his readers lingered, spell-bound, as of old, over the well-known theme. Whatever the shortcomings of Cooper as a writer—and he had many of them—they are far outbalanced by the truthfulness of his delineations, the originality of his conceptions, and his terse, often flowing and harmonious, style.

His last days were spent in his home in New Jersey; his health had for some time been giving way, and had caused great anxiety to his friends; and on the 14th of September, 1851, he breathed his last, in the sixty-second year of his age, surrounded by his friends, at the town which bears the name of his family.

G.

THE NEW CRYSTAL PALACE AT SYDENHAM.

In our last number we inserted a notice of a proposal to convert the Crystal Palace into an immense tower, 1,000 feet high. Since then, however, an entire and beneficial change has taken place in the intentions of the preservers of this noble building. As our readers are probably aware, the government decided by a large majority against retaining the glass palace in its present site, and various speculations were hazarded as to its ultimate disposal. Two parties immediately came to the rescue of the fairy structure, both equally unwilling that the palace, with its social blessings and its real interests for the million, should disappear for ever; and Messrs. Fox and Henderson, the contractors and owners of the building, declared themselves open to treat for the purchase and removal of the materials. The one party was represented by Sir Joseph Paxton, the Dukes of Devonshire and Argyll, the Earl of Carlisle, and other members of the aristocracy; and another by Mr. Fuller, one of the Executive Committee of the late Exhibition, on behalf of several large capitalists. As is not uncommon in these cases, capital prevailed against nobility, and the £70,000 purchase-money was paid by Mr. Fuller to the contractors, the Brighton Railway Company being understood to be the principal speculators. The next point was the formation of a company for the purpose of rebuilding the palace in a spot convenient for the London sight-seers. Several gentlemen were privately spoken to, and in a few days an advertisement appeared in the *Times*, stating that a company for the re-erection of the Crystal Palace had been provisionally registered, and calling on the public to subscribe for shares, so that the sum required—half a million—might be forthcoming. In a day or two applications were made for shares to twice the number at the disposal of the committee, and at the moment we write the five pound shares of the Crystal Palace Company are 20 per cent. premium.

It is necessary, however, to retrace our steps a little. As soon as the purchase of the building was completed, Mr. Fuller wrote to Sir Joseph Paxton, asking him what post in the new undertaking he would like to hold, and to the Duke of Devonshire, proposing to buy a portion of his grace's estates at Chiswick. At first, Sir Joseph declined to accept an appointment, as he hoped that the building—the scene of his triumph—might yet be retained; and the duke, after mature deliberation, signified his unwillingness to part with any of his land at Chiswick: so that, however desirable the situation, all idea of erecting the palace at that spot was abandoned. There was no lack, however, of places, from which to choose; for in answer to their advertisements the committee received no fewer than seventeen offers of land. Among these were two from Wimbledon (Cottenham-park and Wimbledon-park), accompanied by very liberal conditions; one from Colney Hatch, equally favourable; one from Woolwich, one from Kensington, and one from Paddington. The owner of the land at Kensington, a place called Portobello farm, tendered at the modest price of £1,000 an acre; and the Bishop of London, who owns the ground at Paddington, was equally modest in his offer, at £100 an acre annual rental. The directors, labouring then under an *embarras de richesses*, sent out Mr. Fuller on an exploratory tour through all the offered sites, and that gentleman sent in a report, placing Chiswick as No. 1, Wimbledon as No. 2, and Sydenham as No. 3, in eligibility for the purpose

intended. The Duke of Devonshire's decision, of course, threw Chiswick out of calculation, although some modification in his grace's views has since been intimated. Other reasons weighed against Wimbledon, and ultimately the spirited exertions and liberal offers of co-operation on the part of the Brighton Company turned the scale in favour of Sydenham, after a rather sharp struggle with the South-Western Company, who offered the directors £10,000 a year for five years, and a large proportion of the fares afterwards in perpetuity, if they would place the building on the South-Western line. The terms by which the Brighton Company have secured the prize are, an arrangement by which the visitors to the Crystal Palace will be able to start from four metropolitan stations,—viz., Vauxhall, Waterloo-road, London-bridge, and New-cross, at three-fourths of the usual fares, until the shareholders in that undertaking receive six per cent. on their investment—the arrangement commencing from the 15th of May in the present year—and a proportionally liberal arrangement after the happy six per cent. consummation shall have been attained The railway company have, moreover, agreed to construct a line of rail which shall communicate with the other lines, and carry the passengers quite into the palace.

The exact spot chosen—and which many of our London readers will readily recognise—is far away from the dust and smoke of London, and has for its base the line of rails lying between the Sydenham and Anncley stations, stretching over about 280 acres of fine park-like land, to Dulwich Wood, impinging at the corner on the village of Norwood. The lower portion, about 118 acres, has been purchased from Mr Lawrie, and the upper comprehends the ancient manor-house and grounds called Penge Place, once the property of the St. John family, but recently in the occupation of Mr. Leo Schuster, a German merchant, by whom the old Elizabethan mansion was restored, after designs by Mr. Blore. The new Crystal Palace will stand on the highest portion of these grounds, from which, on sunny days, the present building in Hyde-park may be seen, and by a singular coincidence will be placed in the centre of what was once the famous Penge Wood, the ancient pleasure resort of the good citizens of London, as may be seen by reference to "Hone's Everyday Book," in which the sports of Penge Wood are duly chronicled. The ground is at present covered with a dense plantation, much of which must, of course, submit to the axe to make room for the new building; but the handsomest trees will be preserved, and continue to flourish under glass, after the manner of our old friends, the elms, in the transept at Hyde-park.

The construction of the new building has been intrusted to the able hands of Messrs. Fox and Henderson. It will be considerably larger than the present building, and will contain great improvements in form and structure, for instance, the roofing throughout will be concave, it having been found that, besides its more elegant appearance, the transept in Hyde-park was more perfectly impervious to rain. The arrangements with regard to the plants and flowers will be confided to Sir Joseph Paxton; Mr. Owen Jones will superintend the entire decorations; and Digby Wyatt will take office as Director of Works; while Mr. James Fuller and Mr. Scott Russell will bring their knowledge of the late Exhibition to bear on the people's new palace, aided by Mr. George Grove, whose experience in the working of the Royal Commission, and his connexion with the Society of Arts, will tend to the harmonious carrying out of all business arrangements.

With regard to the nature of the amusements promised, there appears to be some degree of uncertainty, time, however, and circumstances will determine these. The plan of a garden and conservatory, in which will be shown all the plants of the tropics,—the stately palm and the embowering banyan, each surrounded by its brethren of the forest,—will be fully carried out under the superintendence of Sir Joseph Paxton; while periodical shows of flowers will tend to give a novel direction to this part of the scheme. In various situations within the building will be placed groups of statuary and single figures, and the different orders of architecture, instructively serialised, will be used in the ornamentation of the park-like grounds surrounding the palace. A great novelty is said to be in contemplation in the shape of numerous fountains, after the manner, though not in imitation, of those at Versailles. Though many have expressed doubts as to the practicability of this part of the plan, it must be remembered that the modern improvements in steam, and the better knowledge of hydraulics possessed by the scientific men of the present day, offer immense advantages as compared with vertical pressure, the only agency adopted to raise water in the fountains at Versailles; besides which, when it is considered that the engineering operations will be conducted by Messrs. Brunel and Robert Stephenson, [illegible] that no scarcity of water can arise, as the mains of the Lambeth Water works run close to the park palings, no fear of the success of this part of the plan need be felt. It is proposed also to admit within the new Crystal Palace a classified series of machines, which will be worked by steam-power, so that various processes in manufactures may be exhibited—not as they were in the old building, where the same class of objects was repeated again and again, but arranged with a view to the education of the eye, and the familiarisation of the minds of the people with mechanical operations. Thus "the lesson taught in Hyde-park, where the cotton entered in the berry and emerged in the bale of goods, where linen rags were passed through the paper-mill and issued in broad sheets of instructive literature, will be repeated in the People's Palace, where every great victory of machinery will find its enduring record and safe depository."

Besides these, the sciences of geology, mineralogy, and botany, will be illustrated on a far greater scale than has been hitherto attempted, and the student will thus have an opportunity of pursuing his favourite science amid the charms of the country, undisturbed by the changes of the seasons. It would be impossible at this early stage of the undertaking to go sufficiently into detail with regard to these subjects, but it is understood that an instructive and attractive novelty will be offered in a collection of figures of the people and costumes of all nations. These will, it is understood, represent the hundred and twenty varieties of the human race, carefully prepared according to the classification of Mr. Pritchard, and other eminent ethnologists. Each figure will be placed in a characteristic attitude and situation—the Indian in his hunting-ground, the Kafir amid his thorny bushes, the Hindoo amid the graceful palms of his country, the Russian amid his snows, and so on through every stage of civilisation: and there is little doubt that a knowledge of the appearance and dress of various nations and tribes is highly important,—the more especially as the tendency of the present age is to blend races together, and to make the Parisian tailor the grand arbiter of costume. Then, again, foreign nations will be invited to send over, as they did to the Great Exhibition, specimens of their arts and manufactures; and inventors and patentees will be allowed to exhibit the fruits of their talent or genius free of all charge, and under the most perfect guarantees of safety. Music of the best kind will constantly form part of the day's entertainment; and though all kinds of refreshments, not intoxicating, will be sold at cheap rates within the building, "the amusements of the tea-garden and the dancing-saloon will be strictly prohibited." From this brief enumeration our readers will perceive what the proprietors of the Crystal Palace propose for their delectation; and we think we may conscientiously say that we believe all their promises will be rigidly carried out. We understand that the government, though they could not consent to give any public money towards the purchase of the building in Hyde-park, have the best wishes towards its successor in Penge Wood;—it is even proposed to open the People's Palace on Sundays; and Lord John Russell—who is always with the progress party, no matter how he may disappoint his friends sometimes—has given it as his opinion that the accessibility of the multitude to a place like this is promised to be, will not only be a great improvement to their habit of frequenting public-houses on the Lord's day, but that it may be made to subserve for higher and more enduring purposes.

"As regards the prospect of a large influx of visitors," says the prospectus of the Company, "some of the statistical facts connected with the Great Exhibition are most instructive. During the period of 24 weeks for which that Exhibition was open, it was visited by upwards of 6,000,000 persons; or, on the average, by upwards of 250,000 per week; and the receipts exceeded £400,000, leaving a net profit of £200,000, after defraying the whole expense of the Exhibition, including the cost of the building. On three consecutive shilling days, the

umber of visitors exceeded 100,000, and the receipts £5,000 er day." From this it is is pretty clear that the Crystal 'alace will be a commercial success; let us hope that it will lso be a moral and educational one as well. P.

SCHOOLS OF DESIGN.

N consequence of the facilities which have of late years been fforded for the examination of works of art, the public taste as been very considerably improved, a love of the beautiful has een—we had almost said created—certainly it has been ourished; and in connexion with this an earnest desire to imi- ate as far as possible that which is so admired. This has been ecently strengthened and encouraged by the premiums offered y the Society of Arts, and by the just eulogiums pronounced y thousands on the splendid displays of human ingenuity ecently made in the Crystal Palace. This has led to the form ion of drawing classes, and schools of design, to the esta- lishment of intelligible and practical lectures on the application ' art to various manufactures; and to the publication of veral valuable essays, papers, &c., all calculated to form the ublic opinion, and to foster and encourage genius wherever it usts. The effect of these exhibitions, lectures, &c., is already anifest. Instead of those strange and uncouth representations ' the human figure, of animals, of buildings, of natural onery, of fruits and flowers, which were formerly placed as lornments on the walls and mantelpieces of the houses of the iddle and industrial classes, we now behold specimens of real t, chaste, elegant, classical, such as may delight the eye, and nvey important information to every inquiring mind.

For the purpose of drawing out latent talent, as well as of aturing and perfecting it, we know of no means more suitable an the formation of drawing classes, and schools of design, ider the management, of course, of competent instructors 'herever the experiment has been fairly made, it has been ianently successful The pupils of the Government School of esign at Somerset House, both the male and female branch, ve from time to time exhibited specimens highly creditable to eir taste and ingenuity, and well worthy the praise, and the ore solid and satisfactory rewards which they received. Some the pupils are making rapid strides towards first-rate excel- nce, and their designs are eagerly sought by several of the ading manufactories of the kingdom. We have now before us eport of the committee of the School of Design established ut two years since in the city of Cork. It appears that the tendance has ranged from one hundred and fifty to one hun- ed and seventy students each quarter. Their attendance has en study, and their perseverance and progress exemplary. The ater number of the males are from those classes actively en- ged in trades or manufactures, or designed to become so; most those forming the exception, are in some way connected with e fine arts or with education. Of the females, a considerable mber are practically engaged as governesses or teachers, or are aining for such employments. Several of these females are dustriously fitting themselves, by the instructions acquired in e school, to become designers and pattern-drawers for em- oidery, crochet, sewed muslins, &c., which promise to afford luable sources of livelihood for many of the poorer classes.

It appears that a selection of the drawings executed by the idents in this school were forwarded last year to Somerset ouse. Several of the drawings were by young men and boys, io were engaged during the day at laborious handicraft opera- ns.

Several employers have acknowledged the benefits derived om the school, in rendering their workmen more skilful, intelli- nt, and better able to execute their orders with taste and pre- ision One young man, a carver by profession, executed in Irish k the gladiatorial figure which was exhibited at the Crystal lace. Another young pupil, of poor parents, a turner by ade, executed in walnut-wood a very beautiful cheval screen, graceful and original pattern, which was much admired, d purchased as a prize at a bazaar for a charitable institution is boy has since got several orders for similar articles, and has ice been in constant employment Several of the pupils who igrated to America have obtained a livelihood, and have ven satisfaction to their employers, from the instructions they tained in this school. The conductors of the embroidery ools have expressed their high sense of the valuable instruc- n afforded to the young females who attend the evening School

Design, an advantage which made itself evident in the perior style of execution of the work committed to them, and greater closeness to the grace and beauty of natural forms.

n addition to those who pay for instruction, we find that *free* pils, to the number of about fifty per quarter, are admitted from those classes who cannot afford to pay for instruction, and who are supplied with drawing materials at half-price. Many of the pupils are constantly passing from elementary drawing to the study of higher and more complex branches of art.

Here, then, is ample encouragement to all who wish to cultivate, or to improve, a taste for the arts of drawing and designing. Let them make a beginning If two or three youths in any town, or village, were but to meet together for the purpose of study, placing before them specimens of what is really excellent, it would soon be noised abroad, and these rising artists would, in a very short space of time, meet with all the encouragement they could possibly desire. Many a Murillo, a Romney, an Opie, a Lough, have begun life with far less encouragement than the humblest and most obscure youth may now hope to obtain. The subject is one of deep interest.

ON THE SOLDIERS WHO PERISHED IN THE WRECK OF THE STEAM-SHIP BIRKENHEAD.

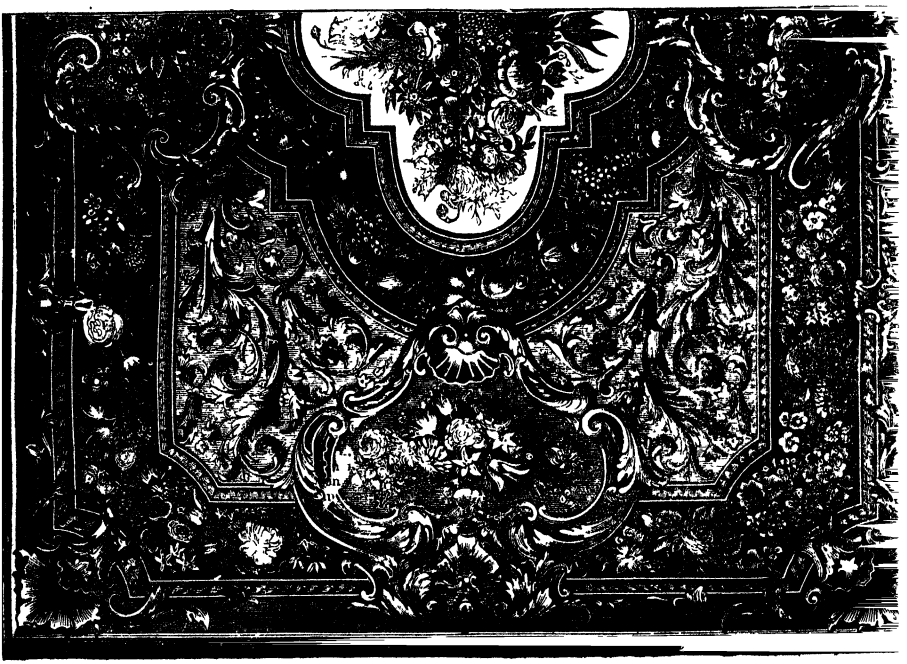
BY ALFRED B RICHARDS.

Lo! there, as if embarking
On some trim polish'd deck,
Five hundred men stand calmly
Upon a parting wreck,
Yet the fierce waves may only
Bid senseless timbers quake—
Yon living *hearts* of oak not all
Their bubbling terrors shake.

No voice was heard complaining,
No shriek rose on the air;
Though God, the sky, the shipwreck,
And sea, alone were there:
No succour met their glances,
While firmly they obey
Their officers stern voices,
Heard through the blinding spray.

She breaks, like some sea vision,
While mast and funnel sweep
Rank after rank, unbroken,
To perish in the deep
But saved were child and woman
Within the fragile boat
No soldier's grasp would peril
To keep himself afloat.

Is there a Roman story
That tells of nobler deed?
'Twas not in strife, when passion
Spurs on the crested steed;
At there, 'mid conflicting feelings,
Those fires each manly breast
To be the heir of glory,
Or seek a hero's rest.



There still is hope for England,
When deed like this is found;
There's glory in Old England,
When hearts like these abound;
Rome hath her pillar'd ruins,
Thermopylæ her stone—
Of this (the only boon I'd crave)
Let brave men speak alone.

WORKING MEN'S MEMORIAL OF SIR ROBERT PEEL.

WE perceive that it is the intention of the committee, of which Joseph Hume, M P , is the chairman, to appropriate the sum subscribed in pence by the working men of Great Britain (£1,745) to a strictly educational purpose Instead of erecting a statue to the memory of Sir Robert Peel, it is determined to apply the annual produce of the fund so raised to the purchase and free distribution of books suitable to the instruction of the industrious and numerous class for whose especial benefit the great statesman fought the fight of free-trade in the House of Commons. The fund, to be denominated the "Working Man's Memorial," is to be transferred to a public and corporate body, so that the yearly proceeds may be for ever devoted to the purpose intended; and thus may every mechanics' institution, every free library to which working men have access, and every public reading room in the United Kingdom, possess permanent records—in a shape historical, scientific, mechanical, and literary—of the great fact which, above all others, distinguished the life of Sir Robert Peel,—namely, the untaxing the food of the people. As soon as the preliminary steps are taken to carry out the proposition of the committee, we shall advise our readers on the subject

CARPETS.—A GOSSIP.

How strangely constituted is the mind of man. In one portion of the world, the animal man is found roaming through primeval forests in all the rude freedom of savage nature: cross a wide sea and enter another country, and you will find man in the luxurious enjoyment of all the refinements of civilisation. You read, and wonder as you read, of the natives of Australia having been discovered by Europeans in a state of such primitive barbarity, as not positively to have been aware of the uses of fire or clothing; you turn a page or two of your history, and you become acquainted with a people who, though they lived three thousand years ago, were familiar with the principal arts which the moderns practise. You open your Hume or Robertson, and you find that, in the reigns of our Edwards and Henrys, the people—rich and noble people, too—were content to sit in

NEW PATTERN BRUSSELS CARPET.—MESSRS. TEMPLETON AND CO., GLASGOW.

chimneyless and carpetless apartments, even though clothed in the velvets of Italy and the silks of India. And yet all these men—the low-type Hottentot, and the courtly Frank, were the same men—that is, men with bodies formed in the same mould, more or less refined by habit, and minds constituted of the same elements, and capable of the same improvements. This train of ideas might be pursued advantageously till we had traced the gradual rise of the human creature from the rude elemental dwellers in woods and forests to the cultivated men of modern times—from the simple seekers for the simplest kinds of food and covering, to the profound thinkers, who, with enlarged minds and earnest hearts, would pierce the great mysteries of nature. A wonderful and an absorbing subject is the study of man—"the proper study of mankind," as the poet tells us; and poets are seldom wrong in their conclusions, though they arrive at them by a kind of intuitive impulse rather than by any direct course of reasoning. Thus we take any article of our domestic life into consideration, we shall find the subject replete with interest. We mention CARPET, and our minds are carried back to the times when the bare earth formed the floor of the peasant's dwelling, and clean strewn rushes were all that monarchs could boast by way of floor-covering for their noblest palaces. A little time and then the tesselated pavements and mosaics of the Romans gave place to these; a few years pass away, and oaken floors of cunning workmanship, inlaid and pierced in many curious forms, and polished up like mirrors, in the houses of the rich, and plain deal floors for poorer people's dwellings take the place of the marble quarterings and tile inlaying; then come carpets. At first, square pieces of linen laid in the centre of the apartment; then simple patterns traced in narrow slips, sewn together edgewise; and lastly, the wonderful combinations of Arabesques and flowers known as Turkey, Persian, Brussels, Scotch, Axminster, or Wilton carpets, many of which are made in single pieces twelve yards square.

The carpet was one of the wants of civilisation, one of the comforts of cold climates, and it rose and improved in the same ratio as the nations using it. It is the test, even now, of a certain standing in society, and the possession of a carpet and a chest of drawers by the dwellers in remote places in England is considered by their owners to give them an air of respectability and property.

It is not our intention, however, to speak at any length of the manufacture of carpets in England. Most of our readers know that the Axminster and Kidderminster carpets are made

in one piece, in large looms, with a warp and weft of strong linen threads, between which are worked or disposed little tufts of coloured wool, in such a way as to form a pattern; that the Brussels carpet is composed of linen and worsted, and that it is made in a large and complicated loom, so that when it is finished the upper surface of the carpet presents the appearance of a multitude of little loops formed into a pattern; that what is called a velvet-pile carpet is a superior kind of Brussels, in which the loops are cut or sheared, so as to produce a velvet-like appearance when finished; and that the Scotch carpet is made entirely of wool, warp and weft, and forms a kind of double cloth, having two sets of faces woven together. Our purpose is rather to suggest than to satisfy. Nor will our space permit us to enlarge on the statistical part of the subject, so as to show that the consumption of carpets in England is four times what it was in the beginning of the present century—a proof, it may be said, of the advance of the poorer classes in the laudable luxuries of life.

A carpet is an appreciable comfort in any man's house; if we look back a little into our memories, we shall discover that our greatest joys have been at home in our snug warm rooms, after the labours of the day are over; when, slippered and at ease, we lay our feet on the hearth-rug and determine to banish the cares of the world for a season. There are some, however, who, with sufficient worldly means, have neither house, nor carpet, nor hearth-rug, nor fire to sit by, let us hope that the number of such desolate fellows will daily become less

A carpet of one's own almost implies a wife to brush and keep it clean, and wherever a loving wife is, there, at least, will be found a snug fireside A carpet is a capital thing for children to play on, and children are the joy of a good man's life A carpet is an indispensable article of domestic ease, therefore let all brave young fellows who think they should like a domestic life, save their money from the grasp of idle pleasures and dissolute companions, and make up their minds to buy a carpet The rest will follow.

[We introduce an engraving of one of the improved Brussels carpets in use at the present time The original was exhibited at the World's Fair last year, it was made in one piece—part of the pattern of which is shown above—and in colour and design was considered equal to anything of the kind on either the British or foreign side of the building J. T.

THE FLOATING ISLAND

A LEGEND OF LOCH DOCHART

ONE night in midsummer, a long, long time ago—so long ago, that I may not venture to assign the date—the moon shone down, as it might have done last night, over the wild, lone shore of Loch Dochart. Upon a little promontory on its southern margin stood a girl, meanly clad, wasted, and way-worn In her arms she bore a little babe, wrapped up in the folds of a plaid, and as she bent her thin, pallid face over that of the child, her rich long, yellow hair fell in a shower around her, unconfined either by *snood* or *curch*. One might have taken her for a Magdalene, in her withered beauty, her penitence, and her grief; but other than Magdalene in her passionate despair. She looked around her, and a shudder shook her feeble frame. Was it the chill of the night mist? It might be, for, as her eye wandered away towards the hills beyond, northward, the mists were creeping along their sides, and she saw the moonlight gleaming on a lowly cot, amid a fir grove. 'Twas the home of her parents—the home of her happy childhood, her innocent youth. She looked again at the little one in her bosom; it slept, but a spasm of pain wrung its pale, pinched, sharp features. It appeared to be feeble and pining, for sleepless nights and days of grief and tears had turned the milk of the mother to gall and poison, and the little innocent drank in death—death, the fruit of sin in all climes and ages. Gently she laid the little one by the margin of the water, and the green rushes; and the breeze of night, sweeping by, murmured plaintively to them, and caused them to sigh, and rock to and fro around the infant. Then the poor mother withdrew a space from the babe, and sat her down upon a white stone, and covered her face with her long, thin, bloodless hands. She said in her heart, as Hagar said, "Let me not see the death of the child." And she wept sore, for the poor girl loved the babe, as a mother like her only can love her babe, with a wild, passionate, absorbing love; for it is her all, her pearl of great price, which she has bought with name and fame, with home and friends, with health and happiness, with earth, and it may be with heaven. And she thought bitterly over that happy home, where a few months since, in the gleaming of the autumn's eve, she sat on the heathery braes, and tripped along the brink of the warbling burn, or milked the kine in the bure, or sang to her spinning-wheel, beside her mother, near the ingle. Next came the recollections of one who sat beside her on the braes, and strayed with her down the burn; who won her heart with his false words, and drew her from the holy shelter of her father's roof, to leave her in her desolation among the southern strangers. And now, with the faithfulness—though not with the purity or truthfulness—of the dove, she was returning over the waste of the world's dark waters to that ark which had sheltered her early years, from which no father had sent her forth. That ark is in sight; but the poor bird is weary from her flight, and she would even now willingly fold her wings, and sink down amid the waters, for she is full of shame, and fear, and sorrow. Ah! will her father "put forth his hand and take her in, and pull her unto him into the ark," with the glory of her whiteness defiled, her plumage ruffled and drooping? Ah! will her mother draw her again to nestle within her bosom, when she sees the dark stain upon her breast, once so pure and spotless? The poor girl wept as she thought of these things—at first wild and bitterly, but at length her sorrow became gentler, and her soul more calm, for her heavy heart was relieved by the tears that seemed to have gushed straight up from it, as the dark clouds are lightened when the rain pours from them. And so she sobbed and mused in the cold, dreary night, till her thoughts wandered, and her vision grew dim, and she sank down in slumber, a slumber like that of childhood, sweet and deep. And she dreamed that angels, pure and white, stood around; and, oh! strange and charming, they looked not on her as the unfallen ones of the world—the pure and the sinless in their own sight—looked upon her through the weary days of her humiliation—scornfully, loathingly, pitilessly; but their sweet eyes were bent upon her full of truth, and gentleness, and love; and tears, like dew-pearls, fell from those mild and lustrous orbs upon her brow and bosom, as those beautiful beings hung over her, and those tears calmed her poor wild brain; and each, where it fell upon her bosom, washed away a stain. Then the angels took the little one from her breast, and spread their wings as if for flight, but she put forth her arms to regain her child, and one of the bright beings repressed her gently, and said,—

"It may not be—the babe goes with us."

Then she said to the angel,—

"Suffer me also to go with my child, that I may be with it and tend it ever!"

But the angel said, in a voice of sweet and solemn earnestness,—

"Not yet, not yet. Thou mayest not come with us now, but in a little while shalt thou rejoin us, and this our little sister."

And the dreamer thought that they rose slowly on the moonlit air, as the light clouds float before a gentle breeze at evening; then the child stretched forth its arms towards her with a plaintive cry, and she awoke, and sprang forward to where her child lay. The waters of the lake rippled over the feet of the mother, but the babe lay beyond in the rushes at the point of the promontory, where she had laid it. The bewildered mother essayed to spring across the stream that now flowed between her and the island, but in vain; her strength failed her, and as she sank to the earth she beheld the island floating slowly away upon the waveless bosom of the lake, while eldritch laughter rang from out of the rushes, mingled with sweet tiny voices soothing, with a fair lullaby, the cries of the babe, that came fainter and fainter on the ear of the bereaved mother, as the little hands of the elfin crew impelled the floating island over the surface of Loch Dochart.

Some herdsmen going forth in the early morning found a girl apparently lifeless lying on the edge of the lake. She was recognised and brought to her early home. When she opened her eyes her parents stood before her. No word of anger passed from the lips of her father, though his eye was

clouded and his head was bowed down with sorrow and humiliation. Her mother took the girl's hand and laid it on her bosom—as she had done when she was a little guileless child—and wept, and kissed her, and prayed over her. Then after a short time she came to know those around her and where she was, and started up and looked restlessly around, and cried out, with a loud and wild cry,—

"My child! Where is my child?"

Near that spot where she had been discovered was found a portion of a baby's garment. The people feared the child had been drowned, and searched the loch along its shores. Nothing, however, was found which could justify their suspicions; but to the astonishment of these archers, they discovered in the midst of the lake a small island, about fifty feet in length, and more than half that in width, covered with rushes and water plants. No one had ever seen it before, and when they returned with others to show the wonder, they found that it had sensibly changed its position.

The home-returned wanderer whispered into her mother's ear all her sin and all her sorrow. Then she pined away day by day. And when the moon was again full in the heavens, she stole forth in the gloaming. She was missed in the morning, and searched for during many days, but no trace could be found of her. At length some fishermen passing by the floating island, scared a large kite from the rushes, and discovered the decaying body of the hapless girl. How she had reached the island none could say—whether it drifted sufficiently near the land to enable her to wade to it in search of her babe, and then floated out again from the shore; or whether beings of whom peasants fear to speak had brought her there. The latter conjecture was, of course, the more generally adopted by the people, and there are those who say that at midnight, when the moon shines down full upon Loch Dochart, he who has sharp ears may hear the cry of a baby mingling with elfish laughter and sweet, low songs from amidst the plants and rushes of the floating island.

MUSICAL INSTRUMENTS

The Rev. W. W. Cazalet, superintendent of the Royal Academy of Music, in a paper which he read a short time since to the members of the Society of Arts, Manufactures, and Commerce, furnished some interesting particulars respecting the organ, the pianoforte, and other musical instruments. He commenced with a history of the organ, as far as it may be gathered from the writings of the later Roman and the mediæval authors. The first mention of a organ in England is in the [illegible] century. This instrument was, however, of a very primitive [illegible] although it had only 400 pipes, it required 26 bellows, which were worked by 76 men; the keys were six inches broad, and the touch so hard, that the performer was obliged to use his fists. Separate keyboards appear to have been introduced in the thirteenth century, while the pedals, the great characteristic of this instrument, were invented by a German named Bernhard in 1170. Reed stops first appear in the account, in 1596, of an organ at Breslau, and the instrument was brought into the state in which it is now commonly known by the invention of the swell in the early part of the last century by an Englishman named Craig.

In the organs of the Exhibition the chief novelties were some new stops and mechanical methods of overcoming the pressure of the wind in instruments of large size.

Messrs. Gray and Davison received a council medal for a new method of coupling, and for a stop between a flute-stop and a reed, called the keraulophon.

Besides their Tuba mirabilis stop, Messrs Hill introduced a mode of shifting the stops by means of keys, and a new valve for lightening the touch, as well as a method of conveying the air through the main framing of the instrument.

Mr. Willis, while adopting the pneumatic lever of Barker and of Ducroquet, has further improved on it by the invention of an exhausting valve, and by other modifications, by which means the touch of the organ, whatever its size, may be made almost as delicate as that of the pianoforte.

Certain novelties in a small organ in the Florentine department, by Messrs. Ducci, were spoken of as likely to lead to great improvements and modifications in the instrument. These are the production of a complete chromatic scale from one pipe, and a method of making a stopt pipe produce the sound of one four times its length.

The pianoforte, the successor of the harpsichord, appears to have been invented about the beginning of the eighteenth century, and to have been introduced into England shortly after Mr. Cazalet then gave an interesting summary of the progressive improvements of the piano, and the authors of them, which, however, as it will not bear condensation, want of space compels us to omit.

In speaking of the finger wind instruments, Mr. Cazalet gave at some length a highly interesting account of the early flute, and of the difficulties in its construction which caused it to be an instrument almost under ban. That it is so no longer is due to the talent and perseverance of Mr. Boehm, of Munich, who, by the application of acoustical science to the form of the flute, and the position and shapes of the holes, has produced an instrument in which, says Mr Cazalet, "perfect equality of tone is for the first time combined with correct intonation." For this achievement Mr Boehm received the council medal. Mr. Cazalet then described the horns, trumpets, cornets, and other valve instruments, closing with the drums of the Exhibition, but into this our space will not allow us to follow him.

We are so accustomed to think of music as a fine art only, as to neglect the very important relations which it bears to commerce and manufactures. To call attention to these relations was Mr. Cazalet's object in the second division of his paper, and the following are some of the interesting statistics which his researches have enabled him to present —

The organ-builders of England may be taken at 100 in number, and, putting their gross returns at £500 per annum each, we have £200,000 a year in this branch alone. The materials used by them are pine, mahogany, tin, and lead.

The materials employed by the pianoforte maker are oak, deal, pine, mahogany, and beech, besides fancy woods, baize, felt, cloth, and [illegible]ather, brass, steel, and iron. Of the two leading houses in this branch, the Messrs. Collard sell annually 1,600 instruments, and the Messrs. Broadwood 2,300, which, at the very low average of 60 guineas, gives as the annual business of these two firms only, about £250,000. If the whole number of pianoforte makers of London, about 200, is taken into account, the annual return in this trade cannot be less than £1,000,000. Violins, and instruments of that class are almost entirely imported, the prejudice being in favour of the foreign makers. The annual import duty on them is probably not less than £45,000.

The cost of the wind instruments required for a regimental band, exclusive of drums and fifes, was said to be £214, and as there are in all about 400 regiments, the capital represented by these is nearly £100,000.

The number of work men employed by Messrs. Broadwood and Messrs. Collard respectively is 575 and 400, these are all more or less skilled workmen, some of them to a very high degree. It is probable that the wages of the artisans employed in this trade do not amount to less than £500,000 per annum.

The great power exerted by music is evidenced by the large number of musical and choral societies, both instrumental and vocal, which exist, as well as the large and increasing audiences which are attracted to their public performances. There can be no doubt that that influence is in a right direction, and that by it the social and moral condition of the people is being elevated and improved. In the fifteen years during which the Sacred Harmonic Society has been established, 271 concerts have been given, attended by more than 510,000 persons.

Mr. Cazalet concluded his lecture with a suggestion for the formation of a Musical Art Union, which he thought would tend most materially to foster and improve rising talent, and create an intense interest among all classes; for there are few who do not, at some time or other, derive enjoyment from this enchanting and delightful art.

Idealisms.—You accuse me of a propensity to idealise. I am sorry that you do not give me credit for sufficient true-heartedness to love the beautiful devotedly without the necessity of colouring it more highly by any imagination. If it were as you say, I should be fated to turn perpetually to new objects, till cold experience gradually taught me better, and warned me against such folly with bitter mockery,—till I sank into hopeless misery. Such a warmth is not that of life, but the unhealthy and transitory glow of fever. —*Niebuhr's Life and Letters.*

DISCOVERIES, SCIENCE, AND MANUFACTURES.

A NOVELTY IN STEAM.—The *New York Journal* contains an account of an engine recently invented by Captain Ericsson, of which two large working models are now in operation. This engine differs in many important respects from anything else in use, and is destined, on the score of economy, safety, simplicity, and convenience, to supersede steam, provided that, when applied to practical purposes, it shall be found to work as well as the inventor anticipates. His reputation for skill and sound judgment, and his long experience in such matters, is a guarantee against any Utopian scheme at variance with the established principles of physics or chemistry, and the method adopted to bring the invention before the public is unexceptionable In connexion with two other gentlemen, he is making preparations for the first public experiment on an unusually large scale A vessel, which cannot be called either a ship or a steamer, is being constructed something over two thousand tons burden, and expected to be ready for launching in August, while the whole force of an extensive establishment is at work upon the machinery That portion of the work already in progress embraces some of the largest castings, of their kind, that have been made in this country The whole affair —from the keelson to the paddle-wheels—teems with novelties Captain Ericsson has been privately at work upon the invention for several years, and now considers it as brought nearly or quite to perfection, so that he can start it on its trial trip to Liverpool with nearly as much confidence as a new steam-ship made after one of the approved models Should the parties interested complete the vessel, as they have commenced it, on their sole responsibility, they will have the profit and honour if it succeeds, and if fails, the satisfaction of having done [illegible] but themselves

IMPROVEMENT IN CARPETS.—Mr [illegible], of Kidderminster, has recently enrolled a patent for improvements in the manufacture of carpets and rugs The improvement consists in employing additional warp together with additional throwing in of weft to each wire inserted in weaving Brussels and velvet-piled carpets and rugs. When using printed or parti-coloured warp in such manufacture, it has been a common practice to have three warp threads, consisting of the printed yarn for making the surface, a thick filling warp for making the body of the fabric, and a fine linen warp for binding the fabric together by its weft, one shoot of weft over, one under, [illegible] of each wire This method is commonly known as "three-shoot" weaving, and differs from that of the patentee, inasmuch as he employs an additional throwing in of weft The ordinary thick filling-warp may be composed of any suitable fibre, and it is preferred that this, as well as the additional thick warp, should be as large as the reed will conveniently admit of In weaving, the thick warp remains stationary, but the additional warp is raised up and down in forming sheds, and the working is performed in such manner as to introduce four shoots of weft to each wire, and all the shoots may be of the same weft, or part of thicker weft than the rest If fabrics are required of still greater thickness than can be produced as the use of one additional warp allows, more may be added thereto

STEAM FIRE-ENGINE.—An American mechanic has built a fire-engine, to which he attaches steam The machine has been tested, and although not in perfect order, steam was raised and water thrown with great rapidity in nine minutes Five minutes is all the time claimed as essential by the patentee The experiment was exceedingly satisfactory. A steam fire-engine is not new, one tried by Mr Ericsson, years ago, is illustrated in "Ewbank's Hydraulics."

IMPORTANT DISCOVERY IN SUGAR-MAKING.—Don Juan Ramos, a native of Porto Rico, has lately made a discovery in the chemistry of sugar making, which is calculated to revolutionise that manufacture Thus much of the secret has been already divulged, "that the agent is a certain ingredient, probably some vegetable extract," which cleanses the saccharine liquor to a degree far beyond that at which the tempered lime hitherto used ceases to operate, while the result is an immensely increased produce of sugar, of a quality very superior to that produced under the present mode, and the greatest merits of all in the discovery are, "that it requires no change in the existing apparatus and involves no additional outlay," and it is "so simple as to be easily acquired" Many experiments have been publicly made, and in some of them with a gain of 41 per cent upon the old method. Mr Ramos guarantees that the gain in all instances shall not be less than 20 per cent. The *Liverpool Chronicle* says of a sample in its possession—"Whether with regard to quality, colour, or strength, the sample of muscovado sugar has elicited the admiration of all who have seen it. An eminent mercantile house, to whom the sample has been shown, pronounces it to be worth 39s.; while a similar quality, manufactured by the old process, is selling in Liverpool at 26s. 6d."

DISCOVERY OF AN EXTENSIVE GUANO DEPOSIT.—Some months ago, the fact of the existence an an extensive guano deposit upon an island of the South Pacific Ocean, was communicated by an old whaling captain to the owner of his vessel. The intelligence was profoundly secret until more fully substantiated. Further search confirmed the first impression Samples of the guano have been analysed by an eminent London chemist, and the following is the result —

7½	parts	salts of ammonia.
8½	„	animal organic matter
2½	„	sulphate of muriate of potash and soda
52	„	phosphate of lime and phosphate of magnesia.
18	„	sand
11½	„	moisture.
100		

By comparison of this analysis with that of the best Peruvian guano, now selling at £9 9s per ton, we understand the value of the new article will be about £5 10s to £6 per ton, but, as it is probable that many cargoes will find their way to the Mauritius and other colonial and foreign markets, the value will be found to vary materially, and, as the samples are said to have been taken from the surface, the amount of ammonia will in all probability increase as the bulk becomes worked into The quantity deposited is stated to be considerable, but no supposition can safely be ventured upon, and the island, from not being near any coast, is quite free from the dangers attending the loading at Ichaboe and other islands on the west coast of Africa, from the setting in of rollers A discovery of this description [illegible] and many others vessels are lying in complete [illegible] idle or seeking freight in our Australian colonies, and also in India—we look upon as means of profitable employment, which many owners will be likely to take advantage of The island, we are informed, is at present unclaimed by any government, and the British flag was the first banner planted upon it But we are not able to inform our readers of the latitude and longitude where it is to be found —Since the above notice appeared, we have been informed that application has been made to the Admiralty for its interference for the protection of British shipping engaged in obtaining cargoes, and that such assistance is refused, on the grounds that the island is known to, and claimed by, the Peruvian government, whose trade the English government are bound to protect. We are further informed that the chargé d'affaires, with whom an interview has been maintained, is not in a position to make terms to enable vessels to load upon the owners' account. Under these circumstances, the possessor of the information has deemed it necessary to apprise those shipowners who contemplate [illegible] less arrangements could be made [illegible] the Peruvian government, great danger would attend attempts to load without the necessary permission to do so.

A parliamentary paper, issued on the motion of Mr Scholefield, shows that the imports [illegible] were—2,881 tons in 1841, 20,398 in 1842, 3,002 [illegible] 1841, 253,300 in 1845; 89,203 in 1846, 82,392 in 1847, 71,[illegible] 1848, 83,438 in 1849; 116,925 in 1850, and 213,016 in 1851

LITERARY NOTICES.

FINE EDITION OF THE POPULAR EDUCATOR.—EDUCATION OF FAMILIES.—No publication has ever been welcomed with such tokens of approval from heads of families as this last of JOHN CASSELL'S works AN EXTRA EDITION, at 1½d per number, or in Monthly Parts, in a neat wrapper, at 7d, or when Five Numbers, 8½d, is now published, which is issued without the weekly headings Persons wishing for this Edition must be careful to order the "*Extra* Edition" The whole of the Numbers may now be obtained, or the first Two Parts—Part I, 7d, Part II, 8½d.

THE ILLUSTRATED EXHIBITOR AND MAGAZINE OF ART.—The First Volume of this splendidly embellished work, handsomely bound, price 6s 6d, or extra cloth gilt edges, 7s. 6d, will be ready July 1, and will contain upwards of Two Hundred Principal Engravings, and an equal number of Minor Engravings, Diagrams, &c

COMPLETION OF JOHN CASSELL'S LIBRARY.—This invaluable Work is now complete, in 26 Volumes, 7d. each in paper covers, double Volumes, cloth, 1s 6d, or when 3 Vols in 1, 2s. 3d The entire Series may be had, bound in cloth, 19s. 6d, or arranged in a Library Box, 25s.

The EMIGRANT'S HANDBOOK, a Guide to the Various Fields of Emigration in all Parts of the Globe, is now ready, price 6d

THE PATHWAY, a Monthly Religious Magazine, is published on the 1st of every month, price twopence—32 pages enclosed in a neat wrapper. Vols I. and II., neatly bound in cloth and lettered, price 2s. 8d. each, are now ready.

THE MINSTREL'S CURSE.

A BALLAD FROM THE GERMAN OF UHLAND.

Once in olden times was standing
A castle high and grand,
Broad glancing in the sunlight,
Far over sea and land.
And round were fragrant gardens,
A rich and blooming crown,
And fountains, playing in them,
In rainbow brilliance shone.

There a haughty king was seated,
In lands and conquests great;
Pale and awful was his countenance,
As on his throne he sate;
For what he thinks is terror,
And what he looks is wrath,
And what he speaks is torture,
And what he writes is death.

There came unto this castle
A gentle minstrel pair,
The one with locks bright, golden,
The other gray of hair;
With harp in hand, the elder
A noble courser rode,
While, beautiful, beside him
His young companion strode.

Said the elder to the younger,
"Now be prepared, my son!
Oh, let the lay be lofty,
And stirring be the tone;
Put forth thy grandest power,
Of joy and sorrow sing,
To touch the stony bosom
Of this remorseless king."

And now within the castle
These gentle minstrels stand
On his throne the king is seated,
With the queen at his right hand,
The king in fearful splendour,
Like the Northern Lights' red glare,
The queen, so sweet and gentle,
Like a moonbeam resting there.

The old man struck the harp-strings,
Most wonderful to hear,
As richer, ever richer,
Swelled the music on the ear.
Then rose, with heavenly clearness,
The stripling's voice of fire,
And then they sang together,
Like a distant angel-choir

They sing of love and spring-time,
Of happy, golden days,
Of manly worth and freedom
They sing the glorious praise;
They sing of all the beauty
The heart of man that thrills,
They sing of all the greatness
The soul of man that fills.

The courtly circle round them
Forget for once to sneer;
And bow those iron warriors,
As though a god were near.
The queen, in softness melting,
Forgets her sparkling crown,
And the rose from out her bosom
To the minstrels she throws down.

"Ye have seduced my people!
What, traitors, d'ye mean?"
The king, he shriek'd in frenzy,
"Seduce ye now my queen?"
His sword, that gleamed like lightning,
At the stripling's heart he flings,
And thence, instead of golden songs,
The gushing life-blood springs.

Yet when he reach'd the gateway,
Then paused the minstrel old,
And took his harp so wondrous,
And broke its strings of gold,
And against a marble pillar
He shiver'd it in twain,
And thus his curse he shouted,
Till the castle rang again —

"Woe, woe, thou haughty castle,
With all thy gorgeous halls!
Sweet string or song be sounded
No more within thy walls!
No! sighs alone, and wailing,
And the coward steps of slaves!
Already round thy towers
The avenging spirit raves!

"Woe, woe, ye fragrant gardens,
With all your fair May light!
Look on this ghastly countenance,
And wither at the sight!
Let all your flowers perish!
Be all your fountains dry!
Henceforth a horrid wilderness,
Deserted, wasted, lie!

"Woe, woe, thou wretched murderer,
Thou curse of minstrelsy!
Thy struggles for a bloody fame,
All fruitless shall they be!
Thy name shall be forgotten,
Lost in eternal death,
Dissolving into empty air,
Like a dying man's last breath!"

The old man's curse is utter'd,
And heaven above hath heard.
Those walls have fallen prostrate
At the minstrel's mighty word.
Of all that vanish'd splendour
Stands but one column tall,
And that, already shatter'd,
Ere another night may fall

Around, instead of gardens,
Is a desert, heathen land,
No tree its shade dispenses,
No fountains cool the sand
The king's proud name has vanish'd,
His deeds no songs rehearse,
Departed and forgotten!
This is the Minstrel's Curse!

One of the Great Elements of Success.—Let us earnestly recommend to all those who handle the pen—whether in writing plays for managers, prescriptions for patients, articles for editors of periodicals, or petitions or memorials to the powers that be—to study caligraphy. Many plays have been thrown aside, many articles returned, many prescriptions misinterpreted, and many petitions neglected, because it was either impossible or difficult to decipher them. Next to the possession of a good hereditary estate and a good temper, a good handwriting will be found the best auxiliary to push through life with.

Gratuitous Services.—Never let people work for you *gratis*. Two years ago, a man carried a bundle for us to Boston, and we have been lending him two shillings a week ever since.

An Asthmatical Remark.—Hugot Arnott was one day, while panting with the asthma, looking out of his window, was almost deafened by the noise of a bawling fellow, who was selling oysters. "The extravagant rascal," said Hugo, "he has wasted in two seconds as much breath as would have served me for a month."

Murder of Mrs Bloomer.—An American correspondent of a London paper says—"A few days ago, Mrs Bloomer was killed in Bridge-street, Boston, by her husband, who is supposed to be insane."

ANSWERS TO CORRESPONDENTS.

A Young Reader.—"*Laissez faire*" means, "Let it alone." When the terms, *The Laissez-faire system* is employed, it means "The Let-it-alone system;" that is, a system that is left to work out its own results.

W. E.—In answer to your question as to the relative position of England, and whether that position may be considered as central, or nearly central, we furnish the following quotation from a No. of "Quarterly Review" of last year:—"If we divide the globe into two hemispheres, according to the maximum extent of land and water in each, we arrive at the curious result of designating England as the centre of the former, or *terrene* half, an antipodal point near New Zealand as the centre of the *aqueous* hemisphere. The exact position of England is not far from the Land's End, so that, if an observer were there raised to such a height as to discern at once the half of the globe, he would see the greatest possible extent of *land*, if similarly elevated in New Zealand, the greatest possible surface of *water*."

W. S.—The word *deodand* has its origin in the Latin words *Deo dandum*, a forfeiture to God, and was intended as an atonement to God for the untimely death of one of his creatures. Thus a horse or carriage which, by accident, causes the death of any human being, becomes forfeited either to the king or the lord of the manor, and ought to be sold, and the proceeds given to the poor.

Inquisitive.—Your questions shall have due attention. Far be it from us to blame you for making such numerous inquiries. It was Locke, we believe, who said that "he attributed what little he knew to the not having been ashamed to ask for information."

Thomas.—You ask us to tell you how you may improve your "*stile*." Do you mean the stile over which persons climb to get into a field? We rather think that you mean your "*style*," or mode of writing. Your best plan will be to read and study the works of our standard English writers, but do, pray, endeavour to improve your spelling.

A Lover of Gardening.—The common *lilac* is not a native of England. The first plant, it is believed, was brought into Europe towards the end of the sixteenth century. Being very showy, easy of culture, and hardy, it soon found its way into the gardens of Europe, and has since been a favourite.

A Working Man.—The portrait and memoir of Mr J. Taylor, jun., of Birmingham, is not likely to appear in the "Working Man's Friend." It will be found in No 21 of the "Illustrated Exhibitor."

M N O.—We cannot reply satisfactorily to your inquiry, as many water companies have rules and regulations peculiar to themselves, and some of them adopt very summary processes to obtain or to recover payment of the rates upon which they have determined.

C Phine.—The word *Eyre* is French, and is derived from the Latin *iter*, a journey. The term about which you inquire, "Justices in Eyre," signifies the itinerant court of justices, or those who journey from place to place to hold assizes.

A Newspaper Reader.—Benjamin Disraeli is not, as you suppose, the author of "The Curiosities of Literature," but the eldest son of that gentleman. Benjamin, the present Chancellor of the Exchequer, is the author of "Coningsby," a political novel.

Abel, M M; and several other Correspondents, had better apply to Messrs *Horne* and *Thornthwaite*, Newgate-street, London, who have published a cheap manual of photography, and of whom plates, acids, powders, and every requisite may be obtained.

Brosus.—Though we neither use nor recommend "*grog*," we have no objection to give you what information we have as to the origin of the word. It is said that the gallant Vernon was dubbed by some of his merry companions "Old Grogram," and he having, after his celebrated reduction of Porto Bello, introduced the use of rum and water into the ship's company, that drink became as celebrated as the Admiral himself, in honour of whom it was surnamed "Grog."

THE HOLY LAND.

THE DEAD SEA—THE JORDAN—SAMARIA—THE VALE OF ESDRAELON—THE LAKE OF GENNESARET—NAZARETH—TYRE.

SITUATED in a deep valley, four thousand feet below Jerusalem, surrounded by mountains, and sterile, desolate hills, without a living creature in its waters, and answering truly to its name, is the Dead Sea. The water appeared, on a recent visit, of a greenish-blue colour, and its surface generally still, yet, at times, slightly rippled by a light southerly breeze. Here and there were a few clouds, which afforded a slight relief from the intense glare and heat of the sun; but there were no trees, no shrubs; nothing, in short, to ward off or soften its rays, leaving only the alternative of patient endurance.

VIEW OF NAZARETH.

Crossing the "Saltish Plain," and riding along the water's edge, some drops of it will occasionally sprinkle the clothes, and it is curious to notice how it discolours them, and how very difficult it is to get the stain out, or to remove traces of the acrid liquid. It is also interesting to mark the intense effort put forth by the poor, suffering, dreadfully treated, and thirsty horses, in order to obtain relief from the water of the Dead Sea. When they come near the water and behold it spread out so invitingly before them, they are eager to get near and into it; they dash their mouths into the liquid brine, hoping to imbibe the cooling and refreshing draught; and for a moment they seem to swallow, as it were unconsciously, the pungent water, but it is only for a moment; disappointed and angry, they throw back their heads, and, more dispirited than ever, pursue the way that their masters wish.

If the traveller wishes to test the density of the water, and lies down on his back flat and powerless, using no effort to keep himself from sinking, he will remain about two-thirds under water, and buoyed up in a manner absolutely unparalleled. In truth, he cannot sink, except by forcing himself under the water, and in a moment he will rise rapidly up again, and lie there, a floating object of life on the surface of a sea beneath which is nothing that exists. On emerging, the body is covered with a liquid, producing a disagreeable, greasy feeling, impossible to get rid of by the aid of towels alone. How fully is the Scripture verified, here and around! "The whole land thereof is brimstone, and salt, and burning, it is not sown, nor beareth, nor any grass groweth therein, like the

overthrow of Sodom and Gomorrah, Admah and Zeboim, which the Lord overthrew in his anger and in his wrath."*

"I was somewhat surprised to find the Jordan," says a recent traveller, "so much narrower than I had supposed; I had expected to see a broad stream, not unlike many of the rivers of less note in our own country; but it is not so; between the steep and often high banks, where the river flows during most of the year, it appeared to me not to be more than sixty or seventy feet wide. It is but a guess and judging by the eye, for I had no means of measurement with me, and therefore is not to be relied upon at all for any accuracy; all that I would affirm positively is that the Jordan is by no means a wide river, and is narrower between its banks than many of the creeks in America.† The current is extremely rapid in this part of its course, running I should think from three to four miles an hour; and so strong is it that very rarely can the most muscular swimmer make head against it: instances happen occasionally of persons being carried away and drowned in consequence of having braved it too far. I think myself a pretty good swimmer, and in ordinary cases should mind nothing launching forth to reach a point a mile or more distant; but when I stood and looked upon the Jordan for a while and tried to estimate the force of that powerful current, I knew that it would not be safe for me to venture out beyond my depth; and I did not. The colour of the water is nearly that of gray slate; and the river appears to gather much sediment in its course from the north; but I cannot express to you how sweet and delightful the water is. Notwithstanding its turbidness and mixture of earthy matter, [illegible] Dead Sea only two hours before, the contrast was very striking, for that is nauseous and pungent to a degree [illegible], this is delicious and refreshing to the taste, almost as much so as the water of the Nile."

A few scattered huts alone remain to mark the site of the City of Palm Trees. A few miserable fellahs lounge under the shade of some trees, and as is their custom, smoke the shibuk and shisheh; and here and there are some rude dwellings of the inhabitants, having nothing to indicate the possession of aught but the simplest and commonest means of life. What a contrast when we look back on the past history of Jericho, and think of its beauty, power, and magnificence in early days! We must now glance rapidly at various spots of peculiar interest.

"We arrived," says the same traveller, "at Sebustieh, or ancient Samaria. Before reaching the city, we had a fine view of its commanding and noble position from the southern valley, from whence rises the hill on which it stands, and we were much struck with the figure used by the prophet Isaiah, when he terms Samaria 'the crown of pride,' and declares that 'the glorious beauty which is on the head of the fat valley, shall be a fading flower, and as the hasty fruit before the summer;'‡ for not unlike a crown is this round and picturesque mount, girted about with a circlet of hills and beautified with fruitful fields, and gardens and flowers. It required but little imagination to induce us to believe that in its palmy days it was one of the most beautiful and noble-looking cities in the world; it was founded, as you will recollect, by Omri king of Israel, who was contemporaneous with Asa king of Judah, and Elijah the great prophet of the Lord, between nine hundred and a thousand years before Christ;§ but now, alas for the pride of man, it is like the faded flower, and its wealth, beauty, and power are all gone, the hill has been ploughed as a field, and where once the lofty palace and the gorgeous structure stood in all their magnificence, where the populous streets and the thousands of inhabitants gave token of life, energy, and power, now naught is found but the few broken columns half covered with earth, and the scanty remains of other days amid the trees, and fields, and gardens, and peasants' huts. We rode up the hill by a steep and winding path, with considerable expectations, and passing the lowering villagers without stopping to parley with them, we hastened to the top of the mount to gaze awhile at the splendid scene which there gratifies the traveller. 'We stood in the very centre of a magnificent panorama. To the north-east and south our horizon was bounded by mountains, enriched with cultivation and villages; towards the west our view admitted of the eye ranging even to the Mediterranean. The valleys which girted the mountain, as well as the mountain itself, are luxuriantly overgrown with trees, especially olives and fig-trees. Around the mountain run, like a coronet, the traces of a terrace, which was probably formed as a decoration to the royal residence.' We spent some little time in visiting and examining the remains of the colonnade, which is situate some distance below the summit of the hill, and on its south-west side or slope. A large number of the pillars are still standing, and most of them are in very good preservation. they are of limestone, about eighteen feet in height and nearly two in diameter; the width of the colonnade Dr. Robinson gives as fifty feet. We followed its course a long way, and were quite satisfied that it extended around the base of the hill for considerably more than half a mile from the point of beginning. It was a sad sight, however, to look upon; for though as many, probably, as a hundred columns are still standing, and the course and splendour of the colonnade as a whole may readily be imagined, still here they stand in the midst of ploughed fields, and utter loneliness and desolation, and in every direction portions of their companions form part of the rude walls for terracing up the slopes, or are half buried in the ground, or carried off to aid in building the houses in the modern town. Truly, it is a testimonial to the labours and wealth of the sanguinary tyrant Herod the Great, which he never anticipated, and we who come from a far-off land and gaze upon the pillars, neither know when they were erected or to what edifice they belonged. We do know that he rebuilt the city of Samaria, adorned it with magnificent structures, and named it, after the emperor Augustus, Sebaste; but we know little more than this. His wealth and magnificence, his power and glory, have all faded away, and naught remains but the memory of his evil deeds, his murders, his jealousies, his awful wickednesses."

All description must fail to convey any clear conception of the fertility and beauty of the plain of Esdraelon, especially as seen when the waving beds of grain, giving promise of a rich harvest, are around and about the traveller at every step; when he beholds the plantations of cotton here and there, the patches or fields of durah or millet, the banks and beds of streams and of rivulets which go to fill up, at certain seasons, "that ancient river, the river Kishon," and when the hills and mountains everywhere greet the eye, and seem, as it were, to be keeping watch and ward over this great valley.

Proceeding over the plain, skirting the western base of Jebel-el-Duhny, or the Little Hermon, and bending towards the west, a full view may be enjoyed of Mount Tabor. It is one of the most striking objects in Palestine, and rises up to a great height above the plain; its shape is conical, and being clothed with verdure, shrubs, and trees, even to the top, it presents itself to the eye as remarkable for its beauty. Its summit bears evidence, in every direction, of the care, skill, and labour bestowed on fortifying this memorable mount. At present, however, it is desolate, and abandoned by man.

Not far from hence is the beautiful lake of Tiberias, which, independently of its great natural beauty, embosomed amidst the hills, has associations of a character calculated to make the deepest impressions on the Christian's heart.

"The brow of the hill, whereon the city of Nazareth was built,"* repays for any fatigue in the ascent by the beautiful panoramic view which is there to be enjoyed. Towards the north and east lies the hill country of Syria and Galilee, with the sun-clad Hermon towering up grandly over all, and the lovely valley of the Jordan, Mount Tabor in the distance, and the lesser hills and heights that bound the vale of Esdraelon; to the south the magnificent plain itself stretches away in the distance, incomparably beautiful as it lies encircled amidst the distant hills and mounts which bound it on every side; in the west, is plainly visible Carmel's lofty range, and the Medi-

* Deut. xxix. 23.

† Dr. Wilson gives the width of the Jordan at this place as exactly forty yards; he estimates the current as at least three miles per hour.—*Lands of the Bible*, vol. ii. p. 17.

‡ Is. xxviii. 1, 4.

§ "And Omri bought the hill Samaria of Shemer, for two talents of silver, and built on the hill, and called the name of the city which he built, after the name of Shemer, owner of the hill, Samaria."—1 Kings xvi. 24.

* Luke iv. 29.

terranean's bright deep blue mirror; while almost at our feet lies the picturesque village of Nazareth.

We close our series of papers on the Holy Land, by the following statements of a traveller, in reference to Tyre:—

"It was a deeply interesting occupation to sit down, as we did, near the gate of the city, under a shady tree, and read the various portions of Holy Writ respecting Tyre, particularly the passages out of Isaiah, Ezekiel, and Zechariah; not less interesting was it to call to mind the history of the past, and to note how exactly the judgments denounced against it have been fulfilled. Tyre was a very ancient city, undoubtedly, being mentioned in the book of Joshua (xix 29) as 'the strong city Tyre;' and Josephus says that it was built two hundred and forty years before the temple of Solomon. The best authorities are not agreed whether it stood originally on the island or on the main land, though the latter is the more common opinion. Bishop Newton supposes—and I think not unreasonably—that while old Tyre stood on the main land, the island at the same time was occupied, and formed in fact an integral portion of the city as a whole. It is termed by the prophet Isaiah (xxiii. 12) the 'daughter of Sidon,' in allusion to the fact that it was founded by a colony from that city, though ere long it out-rivalled that very ancient home of the Phœnicians, and became the most celebrated place in the world for trade, commerce and wealth: hence it is termed "a mart of nations, the crowning city, whose traffickers are the honourable of the earth," in consequence of its pride, arrogance, luxury, and vices of various descriptions, and because of insults and injuries towards God's people, it was denounced by the prophets of Jehovah, and its destruction foretold in the plainest terms. More than a hundred years after Isaiah wrote his prophecy, Nebuchadnezzar, king of Babylon, laid siege to Tyre, and after a long, toilsome, and excessively fatiguing siege of thirteen years, took it and laid it in ruins. Thus, as is probable, was the city on the main land, the Tyrians having mostly withdrawn to the island while the siege was going on, and thus in measure escaped the severity of the enraged conqueror, who does not appear to have captured the island likewise; this was in the year B.C. 573, and after this date Palae Tyrus does not seem to have held any rank or importance in history. After the fall of the Babylonian monarchy, about seventy years from the date of its capture, the city resumed its pristine power and greatness, but continued on the island, and is the Tyre spoken of in the early writers; the former city was never rebuilt. Its destruction was foretold again by Ezekiel and the other prophets, and accordingly Alexander the Great laid siege to it, and after incredible labour and enterprise, constructing a causeway out of the ruins of Palae Tyrus and assaulting the city with engines, in seven or eight months he succeeded in taking the proud metropolis of commerce. Most bitter was the punishment inflicted on it for resisting the great conqueror; he burnt it down to the ground, destroyed or enslaved all the inhabitants, and barbarously crucified two thousand of the captives; this was about B.C. 332. Notwithstanding this terrible blow, Tyre gradually rose again from its ruins, and after Alexander's death, was a strong fortress in possession of the Seleucidæ, subsequently it fell under the dominion of the Romans, and appears to have been a place of some note and importance. Our Lord visited this section of country; and at a later date St. Paul landed here, and finding some disciples, tarried in Tyre seven days. Though not what it once was, the city seems to have enjoyed a large commerce under the empire, and St. Jerome speaks of it as the noble and beautiful city of Phenicia. It was taken by the Saracens about A.D. 639, during the khalifate of Omar, and is said to have possessed a considerable trade under the Mohammedan rule. It was taken by the Crusaders, A.D. 1124, and continued in the hands of Christians a city of importance and strength, until A.D. 1291, when the Mamelukes seized upon it, plundered it of everything valuable, and left it in a dreadful state of misery and degradation. In 1516 it fell into the hands of the Turks under Selim; and ever since that date it has been sunk in ruin and deprived of all its wealth, grandeur, and importance. So that, though the vengeance of God is sometimes long delayed, it is none the less certain; and his word is exactly and literally true, and has been for hundreds of years, when he said of Tyre, 'They shall destroy the walls of Tyrus, and break down her towers; I will also scrape her dust from her, and make her like the top of a rock. It shall be a place for the spreading of nets, in the midst of the sea; for I have spoken it, saith the Lord God:'—'I will bring forth a fire from the midst of thee, it shall devour thee, and I will bring thee to ashes upon the earth in the sight of all them that behold thee. All they that know thee among the people shall be astonished at thee; thou shalt be a terror, and never shalt thou be any more.'*

"As we finished reading the prophetic word, and noting its precise fulfilment, we turned away from the scanty remains of haughty Tyre with mingled emotions of sadness, sorrow, and self-abasement; and we breathed an earnest aspiration that our beloved city and country may take warning, and remember always that 'righteousness exalteth a nation; but sin is a reproach to any people.'"†

A GLIMPSE OF THE SLAVE TRADE IN THE UNITED STATES.

Mr. Haley and Tom jogged onward in their wagon, each for a time absorbed in his own reflections. Now, the reflections of two men sitting side by side are a curious thing. Seated on the same seat, having the same eyes, ears, hands, and organs of all sorts, and having passed before their eyes the same objects, it is wonderful what a variety we shall find in these same reflections!

As, for example, Mr. Haley he thought first of Tom's length, and breadth, and height, and what he would sell for, if he was kept fat and in good case till he got him into market. He thought of how he should make out his gang, he thought of the respective market-value of certain supposititious men and women and children who were to compose it, and other kindred topics of the business; then he thought of himself, and how humane he was, that whereas other men chained their "niggers" hand and foot both, he only put fetters on the feet, and left Tom the use of his hands, as long as he behaved well, and he sighed to think how ungrateful human nature was, so that there was even room to doubt whether Tom appreciated his mercies. He had been taken in so by "niggers" whom he had favoured, but still he was a tomshed to consider how good natured he yet remained!

As to Tom, he was thinking over some words of an unfashionable old book, which kept running through his head, again and again, as follows:—"We have here no continuing city, but we seek one to come, wherefore God himself is not ashamed to be called our God, for he hath prepared for us a city." These words of an ancient volume, got up principally by "ignorant and unlearned men," have, through all time, kept up, somehow, a strange sort of power over the minds of poor, simple fellows like Tom. They stir up the soul from its depths, and rouse, as with trumpet-call, courage, energy, and enthusiasm, where before was only the blackness of despair.

Mr. Haley pulled out of his pocket sundry newspapers, and began looking over their advertisements, with absorbed interest. He was not a remarkably fluent reader, and was in the habit of reading in a sort of recitative, half aloud, by calling in his ears to verify the deductions of his eyes. In this tone he slowly recited the following paragraph:—

"Executor's Sale.—Negroes!—Agreeably to order of court, will be sold, on [illegible] 20, before the court-house door, in the town of Washington, [illegible] following negroes:—Harry, aged 60; John, aged 30, Jean, aged 21, Saul, aged 25, Albert, aged 14. Sold for the benefit of the creditors and heirs of the estate of Jesse Blutchford, Esq.

"Samuel Morris, } Executors.
"Thomas Flint, }

"This yer I must look at," said he to Tom, for want of somebody else to talk to. "Ye see, I am going to get up a prime gang to take down with ye, Tom, it'll make it sociable and pleasant-like—good company, as you'll know. We must drive right to Washington, as I'll tell you, and then I'll clap you into jail while I does the business."

Tom received this agreeable intelligence quite meekly, simply wondering, in his own heart, how many of these doomed men had wives and children, and whether they would feel as he did about leaving them. It is to be confessed, too, that the naïve, offhand information that he was to be thrown into gaol by no means produced an agreeable impression on a poor fellow who had always prided himself on a strictly honest and upright course of life. Yes, Tom, we must confess, was rather proud of his honesty, poor fellow! not having very much else to be proud of, if he had belodged to some of the higher walks of society, he, perhaps, would never have been reduced to such straits. However, the day wore

* Ezek. xxvi. 4, 5, xxviii. 18, 19. † Prov. xiv. 34.

on, and the evening saw Haley and Tom comfortably accommodated in Washington—the one in a tavern, the other in a jail.

About eleven o'clock the next day, a mixed throng was gathered around the court-house steps, smoking, chewing, spitting, swearing, and conversing, according to their respective tastes and turns, waiting for the auction to commence. The men and women to be sold sat in a group apart, talking in a low tone to each other. The woman who had been advertised by the name of Hagar was a regular African in feature and figure. She might have been sixty, but was older than that by hard work and disease, was partially blind, and somewhat crippled with rheumatism By her side stood her only remaining son, Albert, a bright-looking little fellow of fourteen years. The boy was the only survivor of a large family, who had been successively sold away from her to a southern market. The mother held on to him with both her shaking hands, and eyed with intense trepidation every one who walked up to examine him.

"Don't be feard, Aunt Hagar," said the oldest of the men, "I spoke to Mas'r Thomas 'bout it, and he thought he might manage to sell you in a lot, both together"

"Dey needn't call me worn out yet," said she, lifting her shaking hands. "I can cook yet, and scrub, and scour—I'm wuth a buying, if I do come cheap, tell em dat ar—you *tell* 'em," she added, earnestly.

Haley here forced his way into the group, walked up to the old man, pulled his mouth open and looked in, felt of his teeth, made him stand and straighten himself, bend his back, and perform various evolutions to show his muscles, and then passed on to the next, and put him through the some trial Walking up last to the boy, he felt of his arms, straightened his hands, and looked at his fingers, and made him jump, to show his agility.

"He an't gwine to be sold widout me!" said the old woman, with passionate eagerness, "he and I goes in a lot together, "I's raither strong yet, mas'r, and can do heaps of work—heaps on it, mas'r."

"On plantation?" said Haley, with a contemptuous glance "Likely story!" And, as if satisfied with his examination, he walked out and looked, and stood with his hands in his pocket, his cigar in his mouth, and his hat cocked on one side, as if ready for action.

"What think of 'em?" said a man who had been following Haley's examination, as if to make up his own mind from it.

"Wal," said Haley, spitting, "I shall put in, I think, for the youngerly ones and the boy."

"They want to sell the boy and the old woman together," said the man.

"Find it a tight pull, why she's an old rack o' bones, not worth her salt."

"You wouldn't, then?" said the man

"Anybody 'd be a fool 't would She's half blind, crooked with rheumatis, and foolish to boot."

"Some buys up these yer 'old critturs, and sees there's a sight more wear in 'em than a body 'd think," said the man, reflectively.

"No go, 't all," said Haley, "wouldn't take her for a present—fact; I've *seen*, now."
